
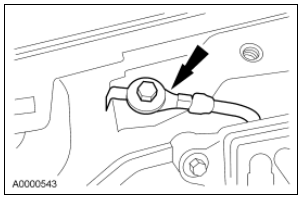
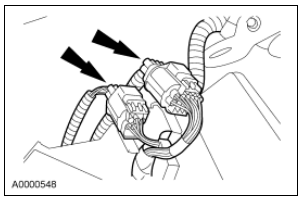
17. Remove the bolt and disconnect the ground strap.

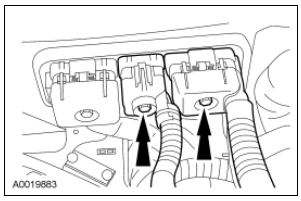


18. **NOTE:** The connectors are located on the backside of the RH strut tower.

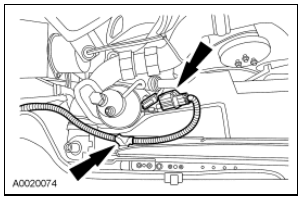
    Disconnect the engine wiring harness electrical connectors.



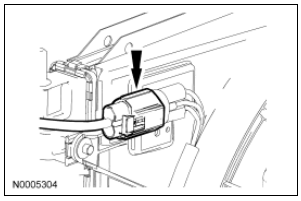
19. Disconnect the bulkhead electrical connectors.



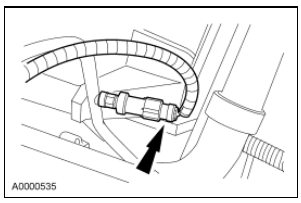
20. Disconnect the coolant valve electrical connector, unclip from the radiator support and position the harness aside.



21. Disconnect the cooling fan electrical connector.

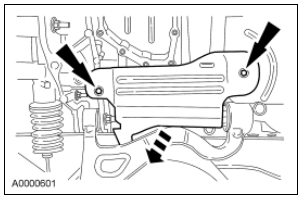


22. Disconnect the A/C pressure switch electrical connector.

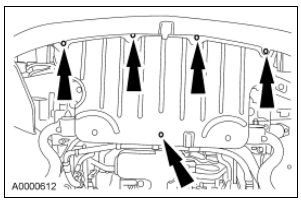


23. **NOTE:** LH shown, RH similar.

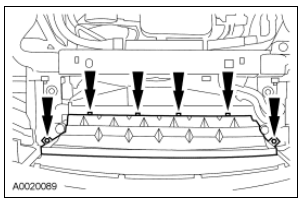
    Remove the LH and the RH splash shields.



24. Remove the center splash shield.



25. Remove the inner air deflector.



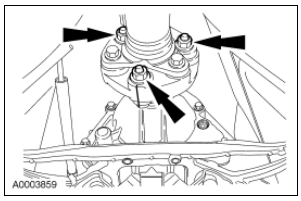
26. Remove the catalytic converters. For additional information, refer to Section 309-00 .

27. ⚠ **CAUTION: To make sure assembly will be in the exact location as when removed, index-mark the bolt, nut, washer and flex coupling to the pinion flange with paint or marker.**

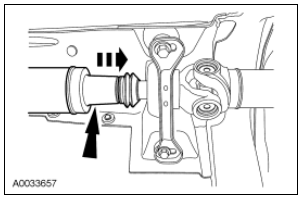
Using a different color paint or marker, index-mark the second bolt, nut, washer and flex coupling to the pinion flange. These fasteners are balanced weights. Always assemble them in their original positions. Failure to do so can cause driveshaft noise, vibration and harshness (NVH).

⚠ CAUTION: Do not remove the bolts retaining the flex coupling to the driveshaft.

Index-mark the front driveshaft pinion flange. Remove the 3 nuts, washers and bolts.



28. Slide the front shaft assembly rearward and support.

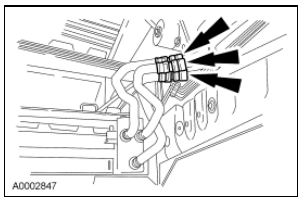


29. Drain the engine oil.
    - Tighten drain plug to 23 Nm (17 lb-ft).

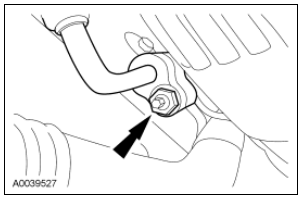
30. **NOTE:** The top heater hose has a green identifying mark to match the hose on the dual coolant flow valve. If the mark is not visible, identify the hoses for location. This will aid in the correct installation of the hose assemblies.

    NOTE: Hose assemblies shown with components removed for clarity.

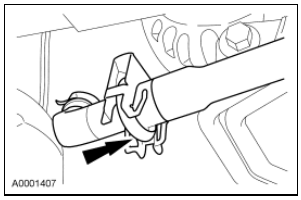
    Disconnect the 3 heater hose quick release couplings. For additional information, refer to Section 412-00 .



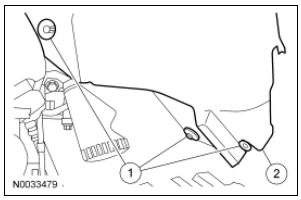
31. Remove the nut and disconnect the A/C high pressure hose.



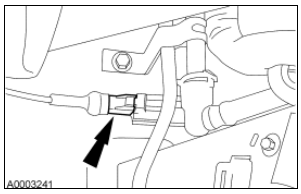
32. Disconnect the low pressure A/C hose.



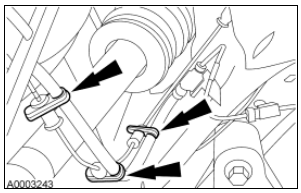
33. Position the RH and LH inner splash shields aside.
    1. Remove the pin-type retainers.
    2. Position the inner splash shields aside.



34. Disconnect the RH and LH anti-lock brake sensor electrical connectors.



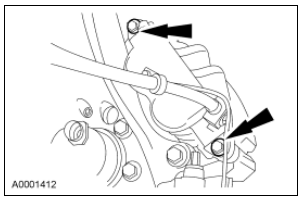
35. Detach the RH and LH anti-lock brake sensor harnesses from the brake hose clips.



36. ⚠ **CAUTION: Do not allow the brake caliper to hang from the brake hose or damage to the brake hose can occur.**

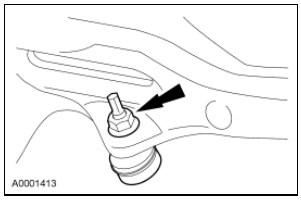
    Remove the 4 bolts and position the front brake calipers aside.

    - Support the calipers using mechanic's wire.



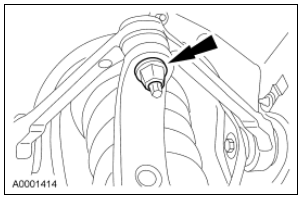
37. **NOTE:** To remove the nut, first loosen the nut, then use the hex-holding feature to prevent the stabilizer bar link ball joint from turning while removing the nut.

    Remove the 2 nuts and disconnect the stabilizer bar links from the lower control arms.

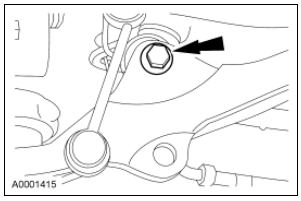


38. **NOTE:** Use the hex-holding feature to prevent the stud from turning while removing the nut from ball joints and stabilizer bar links.

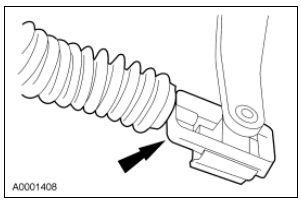
    Remove the 2 nuts and disconnect the upper ball joints from the wheel knuckles.



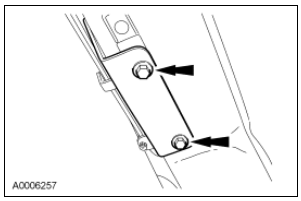
39. Remove the 2 strut-to-control arm bolts and nuts.



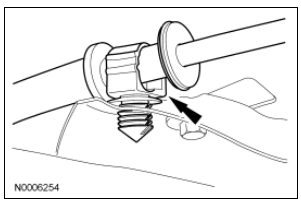
40. Disconnect the shift cable from the shifter.



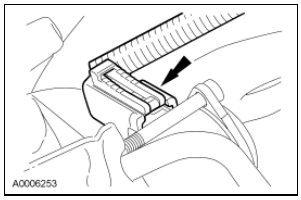
41. Remove the 2 bolts and position the shift cable bracket aside.



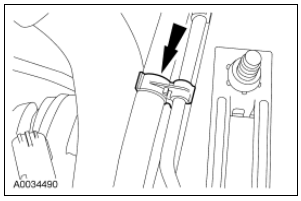
42. Detach the shift cable pin-type retainer from the exhaust heat shield



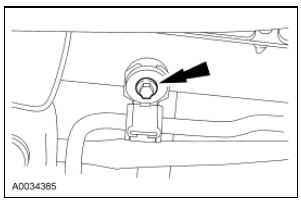
43. Disconnect the variable assist power steering (VAPS) actuator electrical connector.



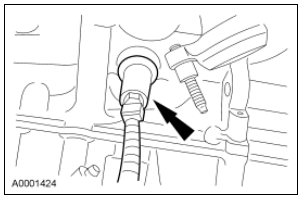
44. Release the power steering return hose from the pressure hose clip.



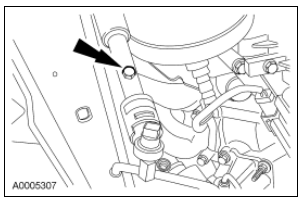
45. Remove the retaining bolt for the high pressure power steering hose bracket.



46. Disconnect the block heater electrical connector, if equipped.

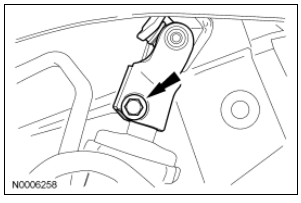


47. Remove the steering shaft bolt.

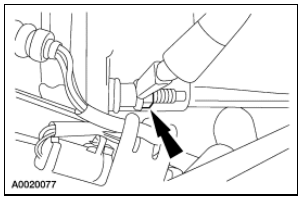


48. ⚠ **CAUTION: Do not allow the steering wheel to rotate while the steering column intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the wheel has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

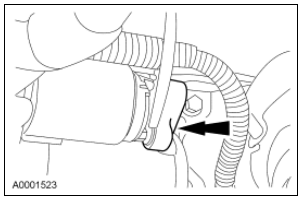
    Remove the bolt and disconnect the steering coupling.



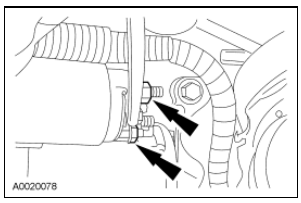
49. Remove the nut and starter motor ground cable.



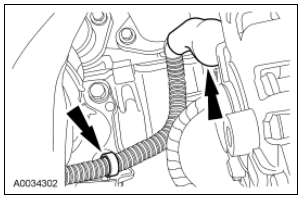
50. Remove the cover.



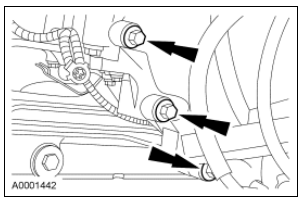
51. Remove the nuts and disconnect the starter motor wiring.



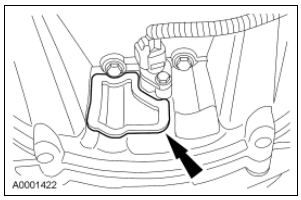
52. Disconnect the generator electrical connector and pin-type retainer.



53. Remove the 6 lower transmission to engine bolts.

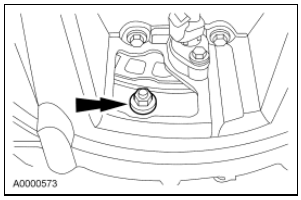


54. Remove the cover.



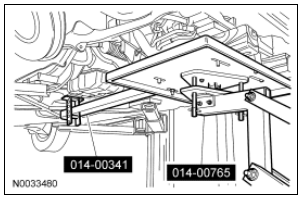
55. **NOTE:** Make an identifying mark on the nut, the stud and adapter plate to allow for correct installation.

    Remove the 4 torque converter nuts.

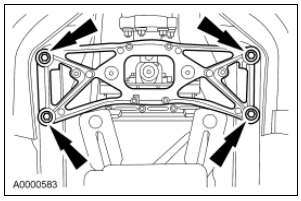


56. Support the rear of the vehicle with suitable safety stands.

57. Support the engine, transmission, front and center crossmembers, and the cooling system with a powertrain lift and a transmission support bracket.

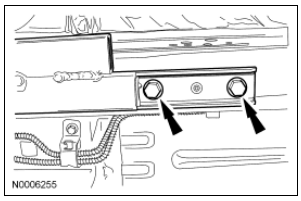


58. Remove the 4 transmission support bolts.



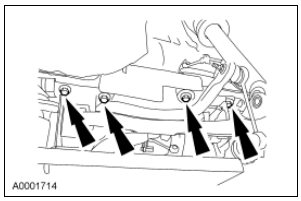
59. **NOTE:** RH shown, LH similar.

Remove the 4 RH and LH center crossmember I-brace bolts.

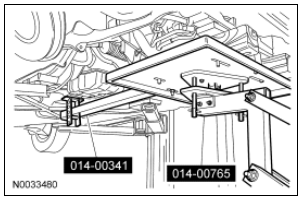


60. **NOTE:** LH shown, RH similar.

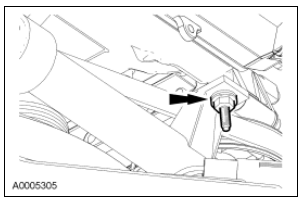
Remove the 4 front crossmember and the 4 center crossmember bolts.



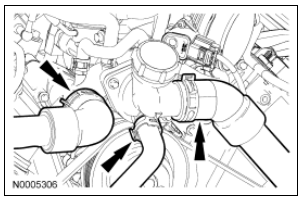
61. Carefully lower the entire assembly from the vehicle.



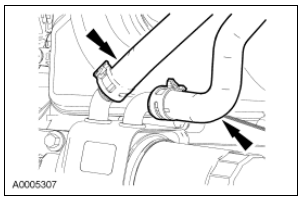
62. Remove the lower radiator hose bracket nut.



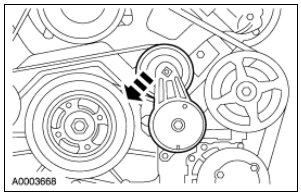
63. Disconnect the lower radiator, upper radiator and heater hose.



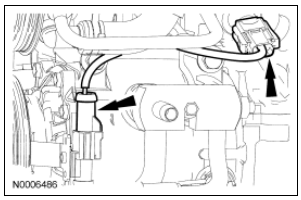
64. Disconnect the 2 oil cooler hoses, if equipped.



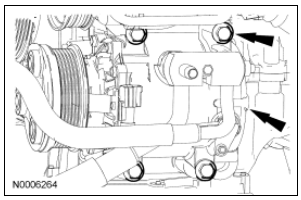
65. Rotate the tensioner and remove the accessory drive belt.



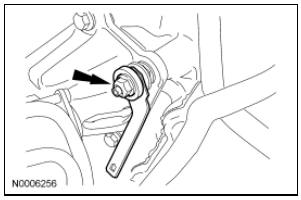
66. Disconnect the A/C compressor and power steering pressure (PSP) switch electrical connectors.



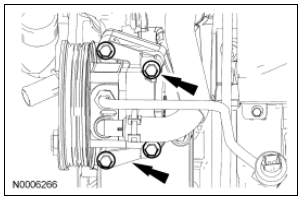
67. Remove the 4 bolts and position the A/C compressor aside.



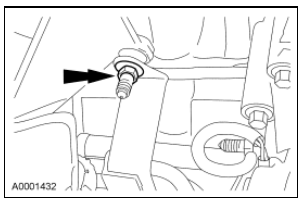
68. Remove the power steering tube bracket nut.



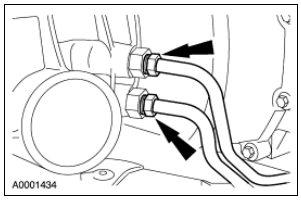
69. Remove the 4 bolts and position aside the power steering pump and reservoir.



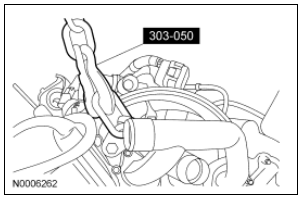
70. Remove the transmission cooler tube bracket nut.



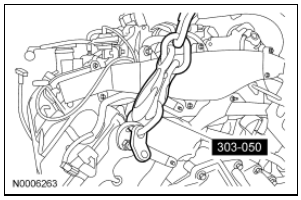
71. Disconnect the transmission cooler tubes.



72. Install the special tool.



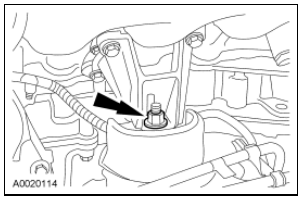
73. Install the special tool.



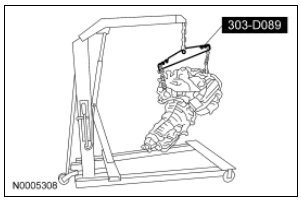
74. Using an engine crane, support the engine and transmission.

75. **NOTE:** LH shown, RH similar.

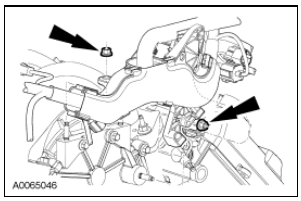
Remove the LH and the RH upper engine mount nuts.



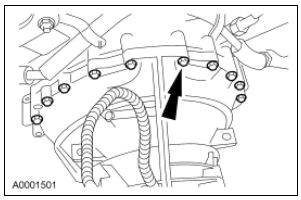
76. Using the special tool and an engine crane, move the engine and transmission from the crossmember and cooling system assembly to rest on the floor or on a bench.



77. Remove the nuts and position the wiring harness aside.



78. Remove the bolts and separate the engine from the transmission.



Engine

Special Tool(s)

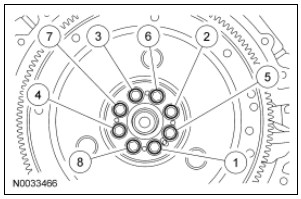
 ST2495-B	Remover/Installer, Crankshaft Rear Oil Seal 303-647
ST2441-A	Adapter for 204-185 204-208 (T95T-5310-AR2)
ST1438-A	Strap Wrench 303-D055
 ST1286-A	Remover, Crankshaft Vibration Damper 303-009 (T58P-6316-D)
ST1385-A	Remover, Oil Seal 303-409 (T92C-6700-CH)
ST2398-B	Aligner, Camshaft 303-530

Material

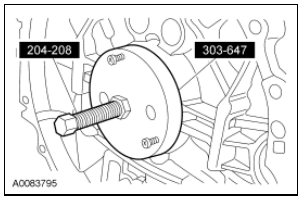
Item	Specification
Silicone Gasket Remover ZC-30	
Motorcraft Metal Surface Prep ZC-31	

NOTE: For additional information, refer to the exploded views under the engine assembly procedure in this section.

1. Remove the bolts in the sequence shown.
   - Remove the flexplate.



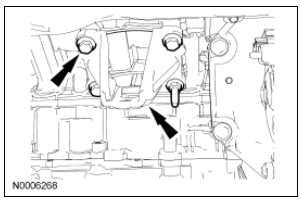
2. Using the special tools, remove the rear main seal.
   - Discard the seal.



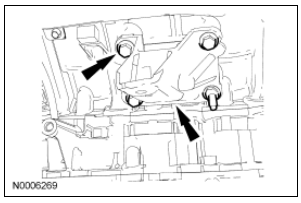
3. Install the engine on a suitable engine stand.

4. Remove the engine block plug to drain the engine coolant.

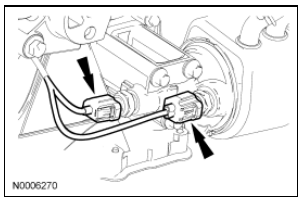
5. Remove the 3 bolts, the stud bolt and the RH engine mount bracket.



6. Remove the 3 bolts, the stud bolt and the LH engine mount bracket.



7. Disconnect the oil pressure and oil temperature sensor electrical connectors.

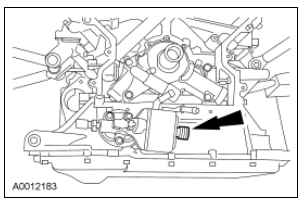


8. Remove and discard the oil filter.

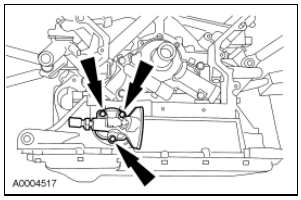
9. ⚠ **CAUTION: A new oil cooler must be installed or severe damage to the engine can occur.**

   Remove the bolt and oil cooler.

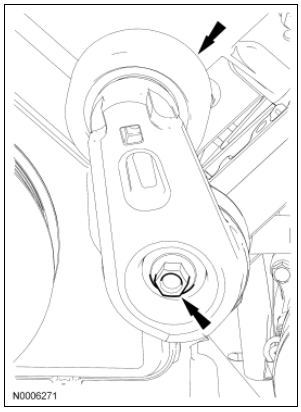
   - Discard the oil cooler and gasket.



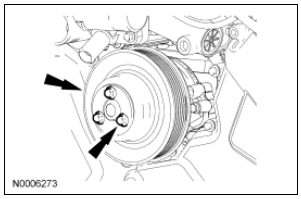
10. Remove the 3 bolts and the oil filter adapter.
    - Discard the O-ring seals.



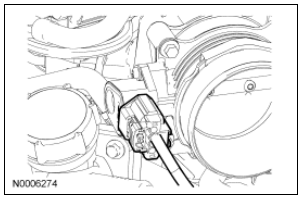
11. Remove the bolt and the accessory drive belt tensioner.



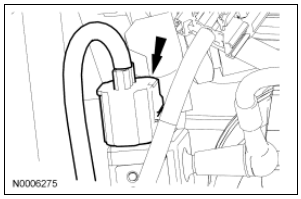
12. Remove the 3 bolts and the coolant pump pulley.



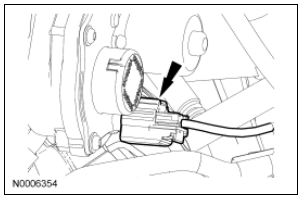
13. Disconnect the throttle position (TP) sensor electrical connector.



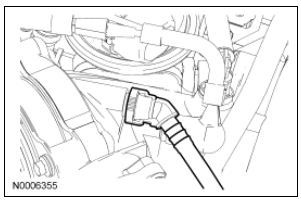
14. Disconnect the fuel pressure sensor electrical connector.



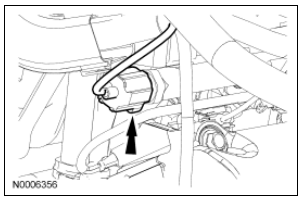
15. Disconnect the electronic throttle body electrical connector.



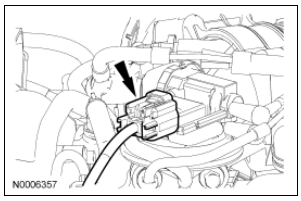
16. Disconnect the evaporative emissions (EVAP) tube.



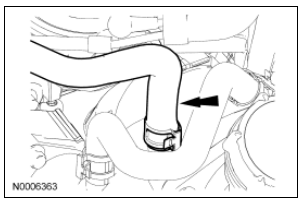
17. Disconnect the fuel rail temperature sensor electrical connector.



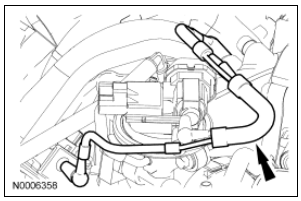
18. Disconnect the exhaust gas recirculation (EGR) system module electrical connector.



19. Disconnect the coolant vent hose from the coolant outlet.
    - Remove the coolant vent hose.



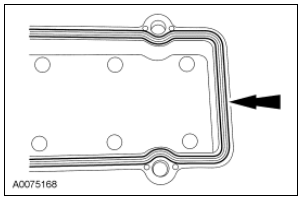
20. Remove the vacuum harness.



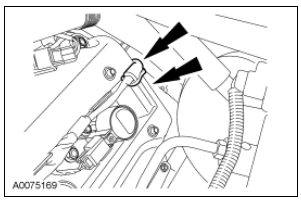
21. **NOTE:** LH shown, RH similar.

    Remove the LH and RH ignition coil covers.

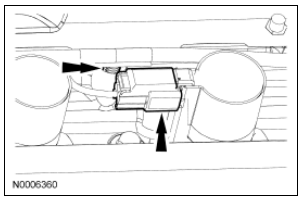
22. Remove all silicone sealer and residue from the ignition coil covers.



23. Remove all silicone sealer and residue from the valve cover surface and ignition coil wiring harness.

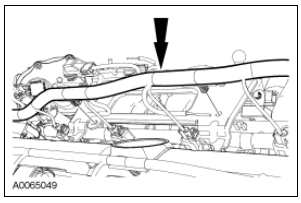


24. Disconnect the 8 ignition coil electrical connectors.

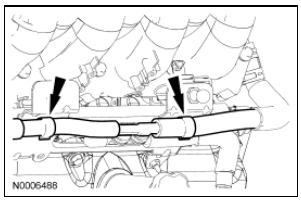


25. **NOTE:** LH shown, RH similar.

Disconnect the engine wiring harness retainers from the engine appearance cover support brackets.

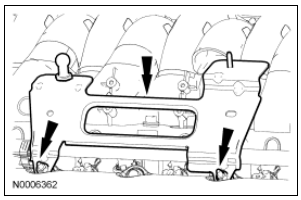


26. Detach the vacuum hose retainers from the LH engine appearance cover support bracket.



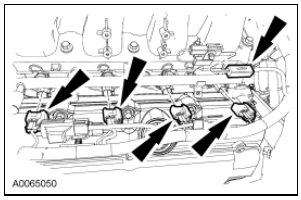
27. **NOTE:** RH shown, LH similar.

Remove the 4 nuts and the 2 engine appearance cover brackets.

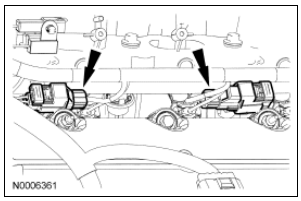


28. **NOTE:** LH shown, RH similar.

Disconnect the 8 fuel injector and the 2 radio interference capacitor electrical connectors.

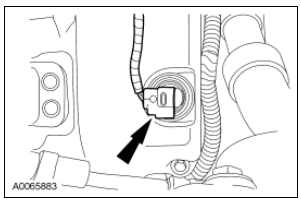


29. Disconnect the knock sensor (KS) and camshaft position (CMP) senor electrical connectors.
    - Detach the pin-type retainers.

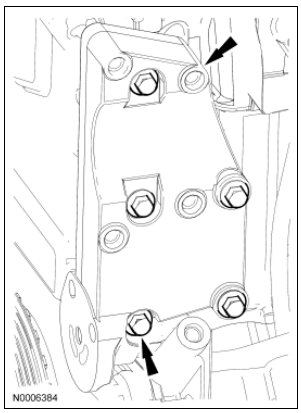


30. **NOTE:** RH shown, LH similar.

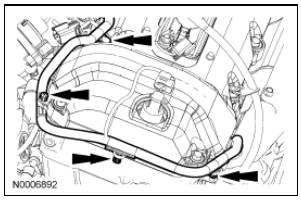
    Disconnect the 2 variable cam timing (VCT) sensor electrical connectors.



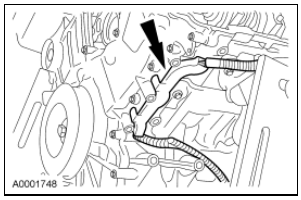
31. Remove the 5 bolts and the power steering bracket.



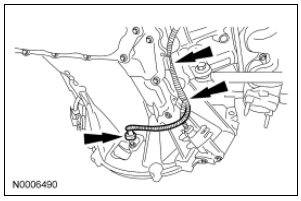
32. Disconnect the wiring harness retainers from the LH valve cover.



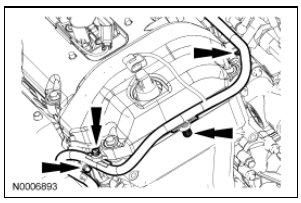
33. Detach the wiring harness from the front cover.



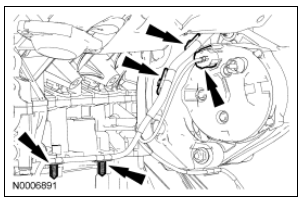
34. Disconnect the crankshaft position (CKP) sensor electrical connector and wiring harness retainers.



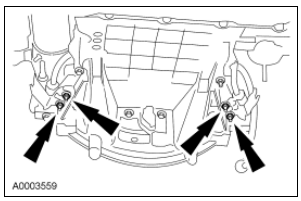
35. Disconnect the wiring harness retainers from the RH valve cover.



36. Disconnect the generator electrical connector and wiring harness retainers.

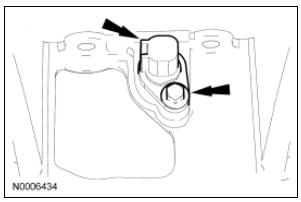


37. Remove the heated oxygen sensor (HO2S) electrical connectors from the brackets.

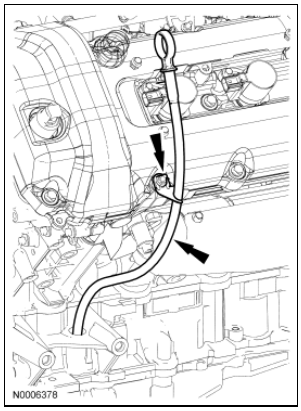


38. Remove the engine wiring harness from the engine.

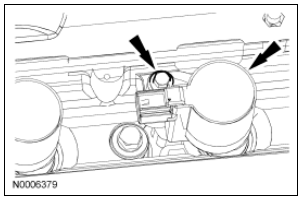
39. Remove the bolt and the CKP sensor.



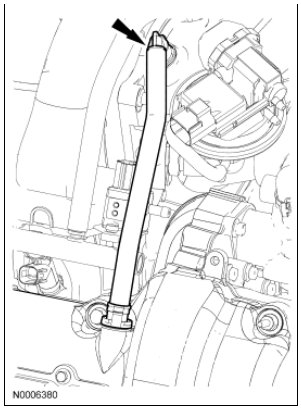
40. Remove the nut and the oil level indicator tube.
    - Discard the O-ring seal.



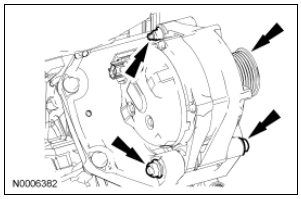
41. Remove the 8 bolts and ignition coils.



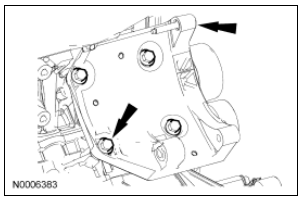
42. Remove the crankcase vent tube.



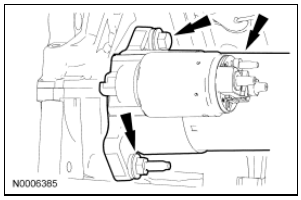
43. Remove the bolt, the 2 nuts and the generator.



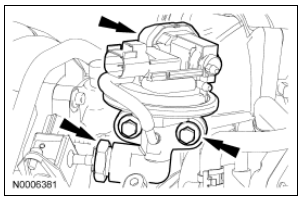
44. Remove the 4 bolts and the generator bracket.



45. Remove the 2 bolts and the starter motor.

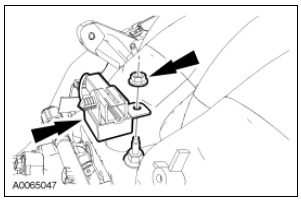


46. Remove the 2 EGR system module bolts and loosen the EGR tube nut.
    - Remove the EGR system module.
    - Discard the gasket.

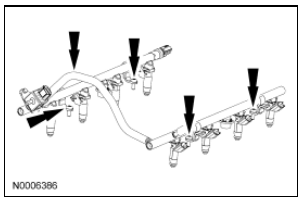


47. **NOTE:** RH shown, LH similar.

    Remove the 2 nuts and the 2 radio interference capacitors.

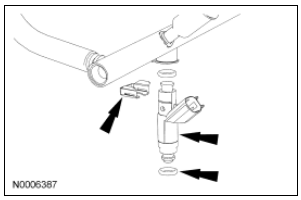


48. Remove the 4 bolts and the fuel rail with fuel injector assembly.

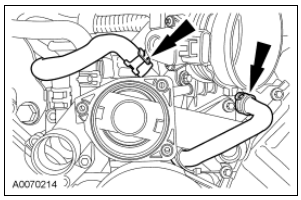


49. **NOTE:** Remove and discard the 16 O-ring seals from the fuel injectors.

    Remove the clips and the 8 fuel injectors from the fuel rail.



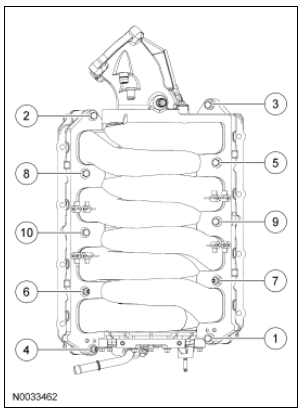
50. Disconnect the 2 throttle body coolant hoses.



51. **NOTE:** The throttle body and adapter are shown removed for clarity. It is not necessary to remove the throttle body and adapter to remove the intake manifold.

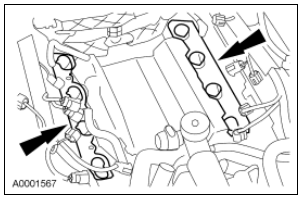
    Remove the 7 bolts and 3 studs in the sequence shown.

    - Remove the intake manifold.
    - Discard the gaskets.

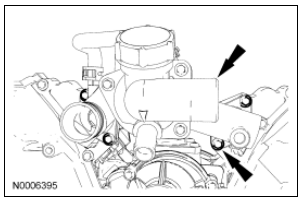


52. ⚠ **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to clean the surfaces.**

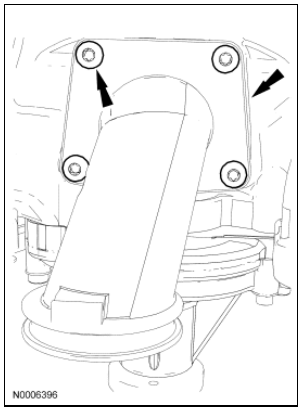
    Clean the sealing surfaces.



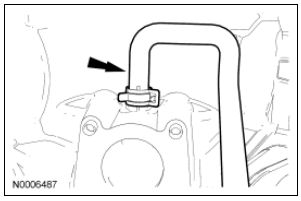
53. Remove the 4 bolts and the coolant bypass housing.
    - Discard the O-ring seals.



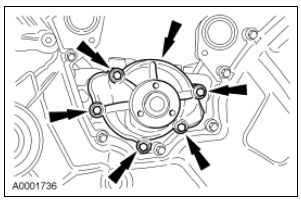
54. Remove the 4 bolts and the coolant inlet housing.
    - Discard the O-ring seal.



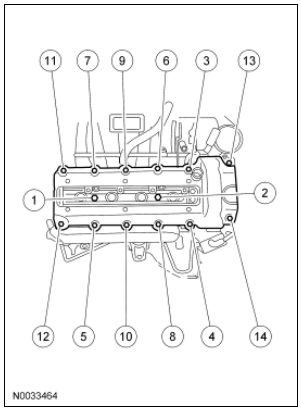
55. Remove the throttle body coolant hose.



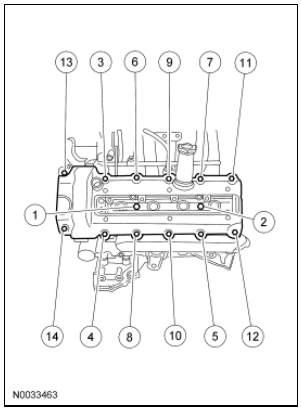
56. Remove the 5 bolts and the coolant pump.
    - Discard the gasket.



57. Remove the bolts in the sequence shown and remove the RH valve cover.
    - Discard the gasket.

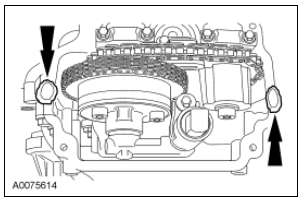


58. Remove the bolts in the sequence shown and remove the LH valve cover.
    - Discard the gasket.

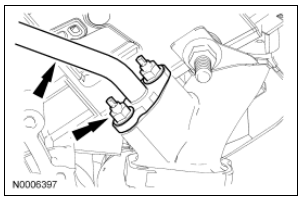


59. ⚠ **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to clean the surfaces.**

    Remove the gaskets and all silicone sealer. Clean the mating surfaces with silicone gasket remover.

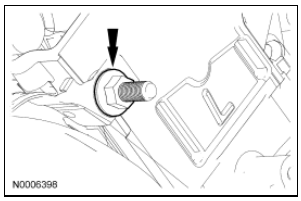


60. Remove the 2 nuts and the EGR tube.
    - Discard the gasket.



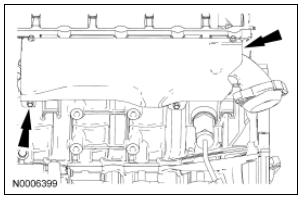
61. **NOTE:** LH shown, RH similar.

    Remove the 2 exhaust manifold heat shield stud bolts.



62. **NOTE:** LH shown, RH similar.

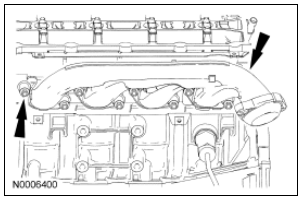
    Remove the 8 bolts and the 2 exhaust manifold heat shields.



63. **NOTE:** LH shown, RH similar.

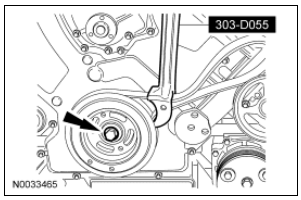
    Remove the bolts, spacers and exhaust manifolds.

    - Discard the gaskets.

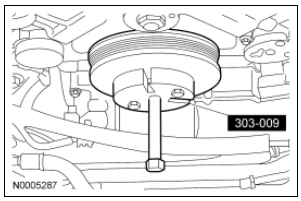


64. **NOTE:** Hold the crankshaft pulley with the special tool while removing the bolt and washer.

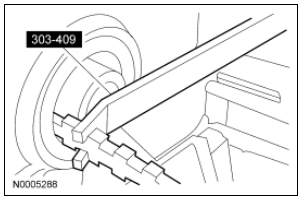
    Remove and discard the bolt and washer.



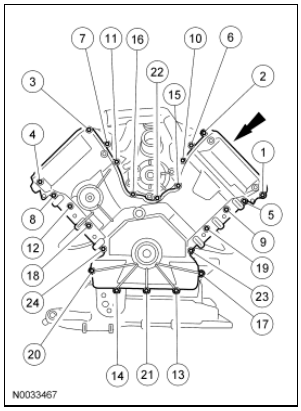
65. Using the special tool, remove the crankshaft damper.



66. Using the special tool, remove and discard the front crankshaft seal.

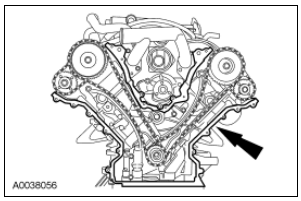


67. Remove the engine front cover bolts in the sequence shown.
    - Remove the engine front cover.
    - Discard the gaskets.

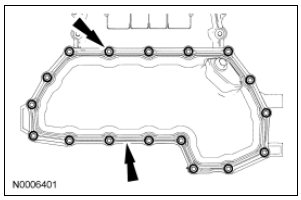


68. ⚠ **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.**

    Clean the sealing surfaces.

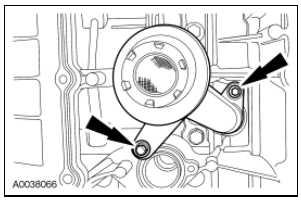


69. Remove the 17 bolts and the oil pan.
    - Discard the gasket.

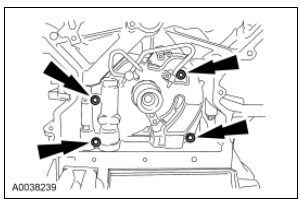


70. ⚠ **CAUTION: Use only hand tools to remove the oil pump screen and tube.**

    Remove the oil pump screen and tube, and the seal.



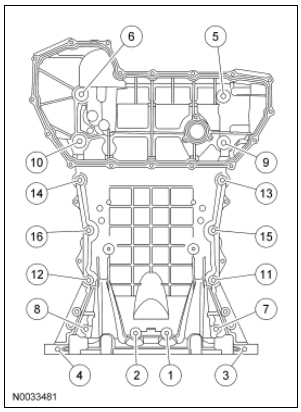
71. Remove the 4 bolts and the oil pump.



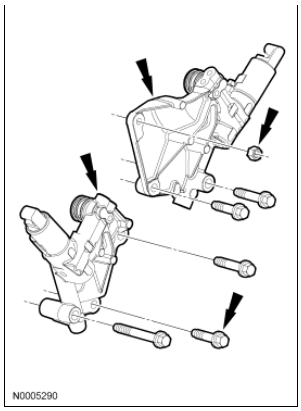
72. ⚠ **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive**

means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of the sealant.

Remove the bolts in the sequence shown and remove the sump body.

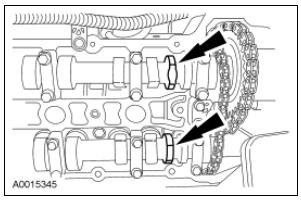


73. Remove the RH and LH VCT bush carriers.



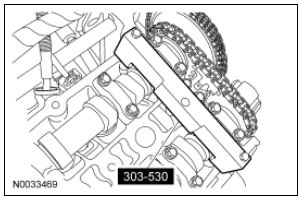
74. Turn the crankshaft to 45 degrees ATDC. The crankshaft keyway will be in the 6 o'clock position.

75. Make sure the flats of the camshaft are facing upward. If not, repeat the previous step.



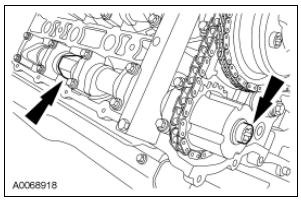
76. ⚠ **CAUTION: The flats on the camshaft must completely contact the special service tool or damage to the camshafts can occur. Slowly draw the special tool down evenly until it is fully seated on the camshaft flats.**

Install the special tool on the RH cylinder head.



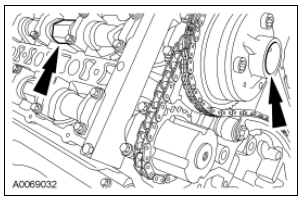
77. ⚠ **CAUTION: An open-end wrench must be used on the hex area of the camshaft or damage to the head will occur.**

    Remove and discard the exhaust camshaft sprocket bolt.

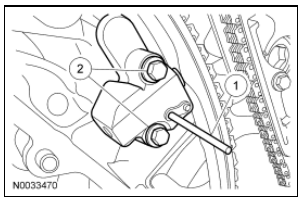


78. ⚠ **CAUTION: An open-end wrench must be used on the hex area of the camshaft or damage to the head will occur.**

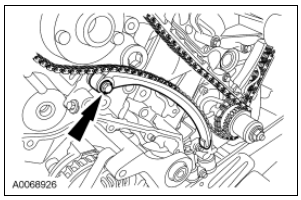
    Remove and discard the VCT unit bolt.



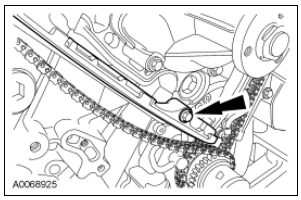
79. Remove the RH timing chain tensioner.
    1. Push the lever down and install a drill rod to lock the piston.
    2. Remove the bolts and the tensioner.



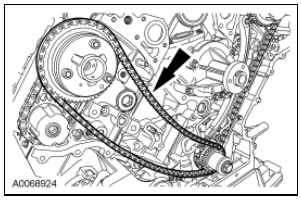
80. Remove the bolt and the RH tensioner arm.



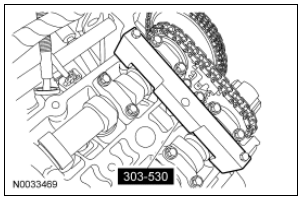
81. Remove the bolt and the RH timing chain guide.



82. Remove the RH primary timing chain.

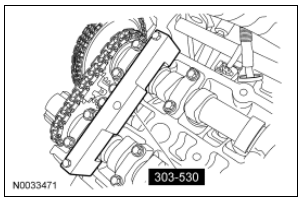


83. Remove the special tool from the RH cylinder head.



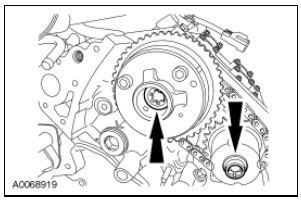
84. ⚠ **CAUTION: The flats on the camshaft must completely contact the special service tool or damage to the camshafts can occur. Slowly draw the special tool down evenly until it is fully seated on the camshaft flats.**

    Install the special tool on the LH cylinder head.

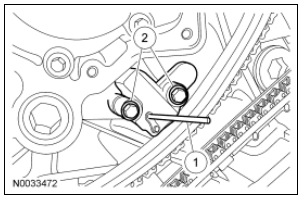


85. ⚠ **CAUTION: An open-end wrench must be used on the hex area of the camshaft or damage to the cylinder head will occur.**

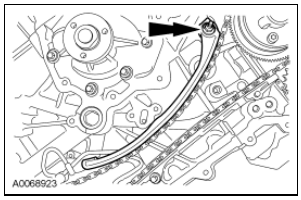
    Remove and discard the LH VCT unit bolt and the exhaust camshaft sprocket bolt.



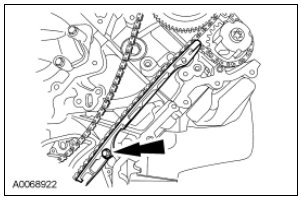
86. Remove the LH timing chain tensioner.
    1. Push the lever down and install a drill rod to lock the piston.
    2. Remove the 2 bolts and the tensioner.



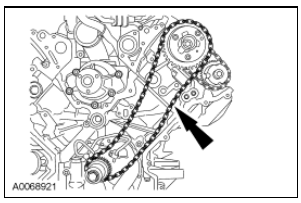
87. Remove the nut and the LH tensioner arm.



88. Remove the bolt and the LH timing chain guide.

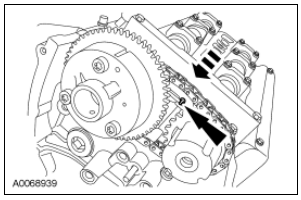


89. Remove the LH primary timing chain.

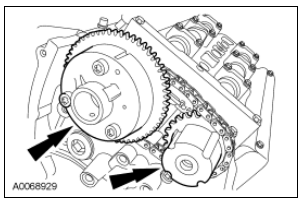


90. Remove the crankshaft sprocket.

91. Collapse the LH secondary timing chain tensioner and install a pin to lock the piston.

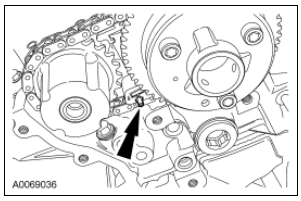


92. Remove the LH VCT unit, exhaust camshaft sprocket and timing chain as an assembly.

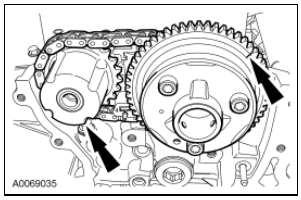


93. Remove the 2 bolts and the LH secondary timing chain tensioner.

94. Collapse the RH secondary timing chain tensioner and install a pin to lock the piston.

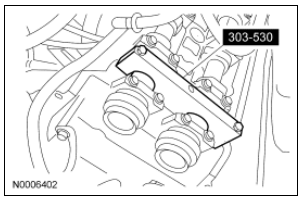


95. Remove the RH VCT unit, exhaust camshaft sprocket and timing chain as an assembly.



96. Remove the 2 bolts and the RH secondary timing chain tensioner.

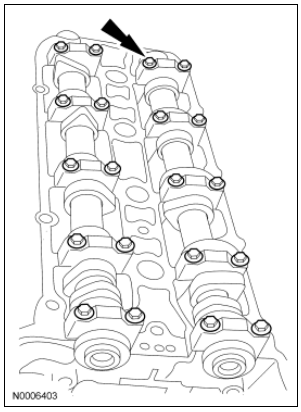
97. Remove the special tool.



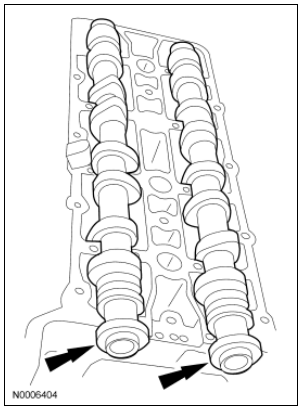
98. ⚠ **CAUTION: Record the camshaft bearing cap locations. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage can occur.**

    Remove the LH camshaft bearing caps.

    - Remove the bolts.
    - Remove the LH camshaft bearing caps.



99. Remove the LH camshafts.

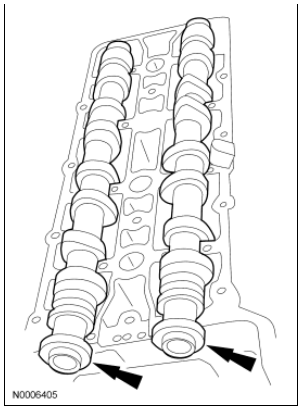


100. ⚠ **CAUTION: Record the camshaft bearing cap locations. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage can**

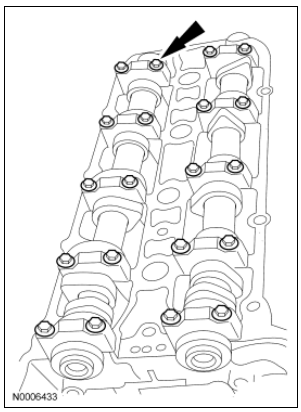
occur.

Remove the RH camshaft bearing caps.

- Remove the bolts.
- Remove the RH camshaft bearing caps.



101. Remove the RH camshafts.



102. ⚠ **CAUTION: Do not use any means of marking the shims other than a permanent-type marker. Any scratches or paint on the shims can result in incorrect lash adjustments and severe engine damage.**

⚠ **CAUTION: Record the shim and bucket tappet location. The shim and bucket tappet are positional and if installed in the incorrect location, engine damage can occur.**

Record the location of the valve tappets.

- Remove the valve tappets.

103. ⚠ **CAUTION: The cylinder head must be cool before removing it from the engine. Cylinder head warpage can result if a warm or hot cylinder head is removed.**

⚠ **CAUTION: Place clean shop towels over exposed engine cavities. Carefully remove the towels so foreign material is not dropped into the engine.**

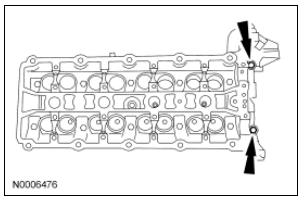
⚠ **CAUTION: The cylinder head bolts must be discarded and new bolts installed. They are tighten-to-yield designed and cannot be reused.**

⚠ CAUTION: Aluminum surfaces are soft and can be scratched easily. Never place the cylinder head gasket surface, unprotected, on a bench surface.

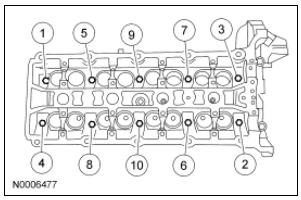
NOTE: RH shown, LH similar.

Remove the RH and LH cylinder head end bolts.

- Discard the bolts.



104. Remove and discard the bolts from both cylinder heads in the sequence shown.
    - Remove the cylinder heads.
    - Discard the gaskets.



105. **⚠ CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges, which make leak paths. Use a plastic scraping tool to remove all traces of sealant.**

    ⚠ CAUTION: Observe all warnings or cautions and follow all application directions contained on the packaging of the silicone gasket remover and the metal surface prep.

    NOTE: If there is no residual gasket material present, metal surface prep can be used to clean and prepare the surfaces.

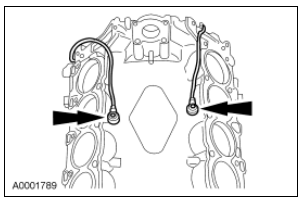
    Clean the cylinder head-to-cylinder block mating surfaces of both the cylinder head and the cylinder block.

    1. Remove any large deposits of silicone or gasket material with a plastic scraper.
    2. Apply silicone gasket remover, following package directions, and allow to set for several minutes.
    3. Remove the silicone gasket remover with a plastic scraper. A second application of silicone gasket remover may be required if residual traces of silicone or gasket material remain.
    4. Apply metal surface prep, following package directions, to remove any remaining traces of oil or coolant, and to prepare the surfaces to bond with the new gasket. Do not attempt to make the metal shiny. Some staining of the metal surfaces is normal.

106. **NOTE:** The straightedge used must be flat within 0.0051 mm (0.0002 in) per foot of tool length.

    Support the cylinder head on a bench with the head gasket side up. Inspect all areas of the deck face with a straightedge, paying particular attention to the oil pressure feed area. The cylinder head must not have depressions deeper than 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area, or scratches more than 0.0254 mm (0.001 in).

107. Remove the bolts and the knock sensor.



Cylinder Head

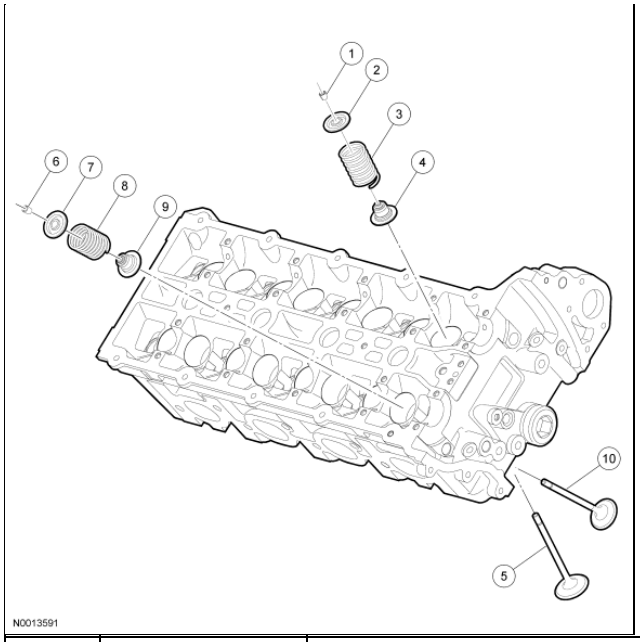
Special Tool(s)

ST2489-A	Compressor, Valve Spring 303-648

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (in Canada Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12) or equivalent	WSS-M2C930-A

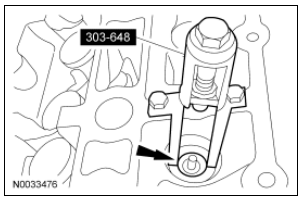


Item	Part Number	Description
1	6518	Intake valve spring retainer key (16 required)
2	2762	Intake valve spring retainer (8 required)
3	6513	Intake valve spring (8 required)
4	6A536	Intake valve stem seal (8 required)
5	6507	Intake valve (8 required)
6	6518	Exhaust valve spring retainer key (16 required)
7	2762	Exhaust valve spring retainer (8 required)
8	6513	Exhaust valve spring (8 required)
9	6A536	Exhaust valve stem seal (8 required)

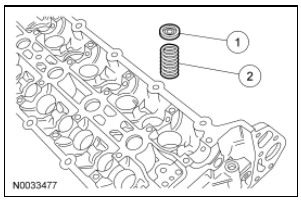
10	6505	Exhaust valve (8 required)

Disassembly

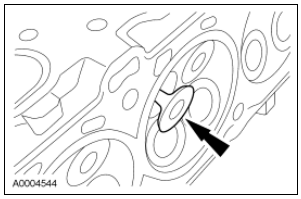
1. Using the special tool, remove the valve spring retainer keys.



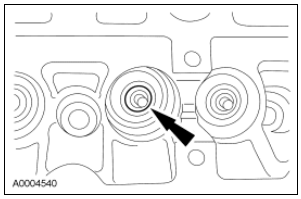
2. Remove the valve spring assembly.
    1. Remove the valve spring retainer.
    2. Remove the valve spring.



3. Remove the valve.
    - For component tests for the valve, refer to Section 303-00 .
    - For component tests for the cylinder head, refer to Section 303-00 .



4. Remove and discard the valve stem seal.



5. Repeat the procedure until all of the valves are removed from the cylinder head.

6. Remove the bolt and the camshaft position (CMP) sensor.

7. Remove and discard the cylinder head temperature (CHT) sensor.

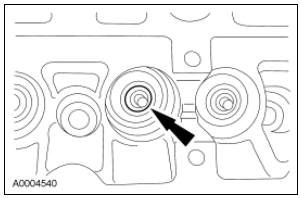
Assembly

1. Install a new CHT sensor.
    - Tighten to 22 Nm (16 lb-ft).

2. Install the CMP sensor and bolt.
    - Tighten to 10 Nm (89 lb-in).

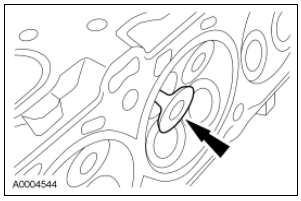
3. **NOTE:** Lubricate the valve stem seal with clean engine oil prior to installation.

   Install the valve stem seal.

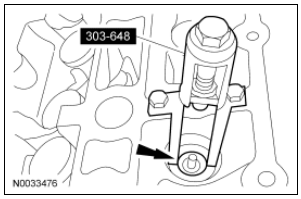


4. **NOTE:** Lubricate the valve stem with clean engine oil prior to installation.

   Install the valve.



5. Using the special tool, install the valve spring, retainer and retainer keys.



6. Repeat the procedure until all of the valves are installed into the cylinder head.

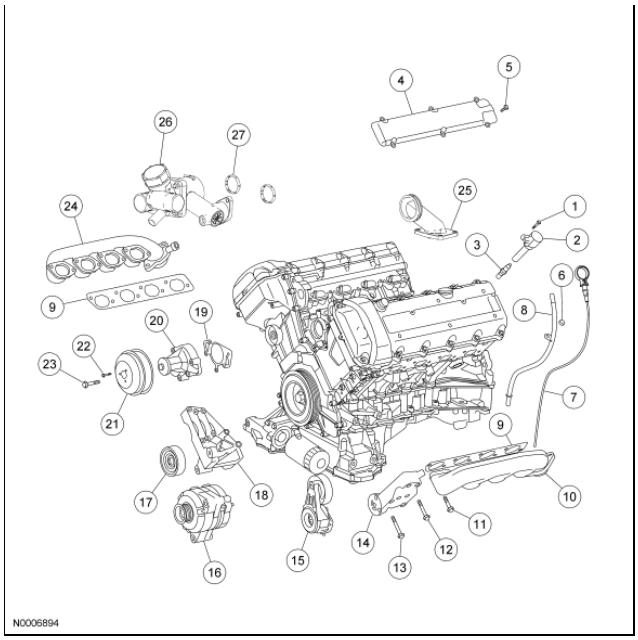
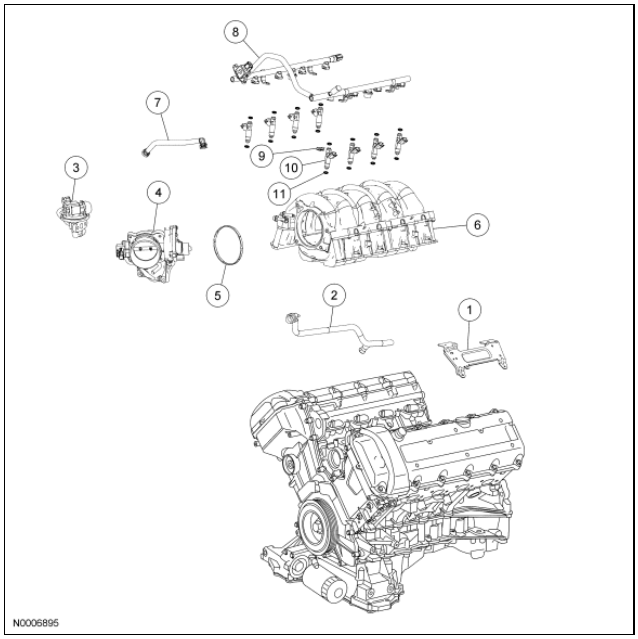
17	6840	Gasket
18	W704995	Oil drain plug
19	6695	Oil pan assembly
20	6714	Oil filter
21	6A644	Oil filter adapter
22	W704816	Bolt (3 required)
23	6C674	Upper sump assembly
24	6600	Oil pump
25	W500304	Bolt (4 required)
26	6K297	Timing chain guide (2 required)
27	W500302	Bolt (2 required)
28	6306	Crankshaft timing chain sprocket (2 required)
29	6E009	Front cover gasket (outer)
30	6L266	Timing chain tensioner arm
31	W704751	Bolt (24 required)
32	W705542	Bolt
33	W704965	Washer
34	6316	Crankshaft pulley
35	6700	Front cover seal
36	6059	Engine front cover assembly
37	6C075	Front cover seal (inner)
38	6A642	Oil cooler

Lower End Exterior Dress



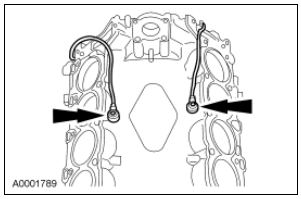
Item	Part Number	Description
1	W500205	Bolt (8 required)
2	12A366	Ignition coil (8 required)
3	12405	Spark plug (8 required)
4	12025	Coil cover (2 required)
5	W500205	Bolt (12 required)
6	W520411	Nut
7	6752	Oil level indicator
8	6754	Oil level indicator tube
9	9448	Exhaust manifold gasket (2 required)
10	9431	Exhaust manifold, LH
11	W701240	Bolt (16 required)
12	W500315	Bolt (3 required)
13	W704752	Bolt (2 required)
14	3K738	Power steering bracket
15	6B209	Drive belt tensioner
16	10300	Generator
17	19A216	Idler pulley, flanged
18	3D743	Generator bracket
19	8507	Coolant pump gasket
20	8501	Coolant pump
21	8509	Coolant pump pulley
22	W705629	Bolt (3 required)
23	W500304	Bolt (5 required)
24	9430	RH exhaust manifold
25	8K515	Coolant inlet
26	8A520	Coolant outlet
27	8255	O-ring seal

Upper End Exterior Dress



Item	Part Number	Description
1	6N081	Engine appearance cover bracket (2 required)
2	9E470	Exhaust gas recirculation (EGR) tube
3	9D460	EGR system module
4	9F991	Electronic throttle body
5	W701662	Electronic throttle body gasket
6	9425	Intake manifold
7	9K617	Crankcase ventilation hose
8	9S441	Fuel rail
9	9N976	Clip (8 required)
10	9F593	Fuel injector (8 required)
11	W705818	O-ring seals (16 required)

1. Install the knock sensors (KS) and 2 bolts.
   - Tighten to 20 Nm (15 lb-ft).



2. Lightly oil the new cylinder head bolts and allow to drain for a few minutes before installing.

3. **⚠ CAUTION: The gasket sealing surfaces on the cylinder head and cylinder block must be clean and dry.**

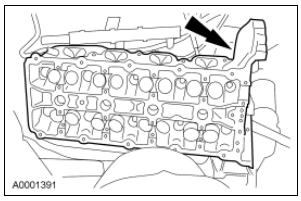
   ⚠ CAUTION: The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

   ⚠ CAUTION: The new gasket has a film coating which is crucial to the gasket's ability to seal correctly. Do not scratch the gasket.

⚠ CAUTION: Cylinder head machining or milling is not authorized by Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.

⚠ CAUTION: Do not allow the dowels to scratch the sealing surface of the cylinder head during cylinder head installation.

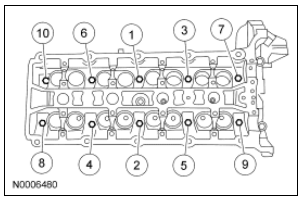
Install new gaskets and position the cylinder heads on the engine.



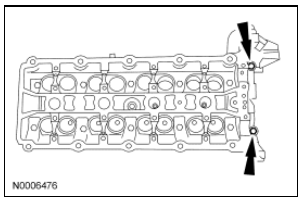
4. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. Always use new bolts.

   Install and tighten the RH head bolts in 4 stages in the sequence shown.

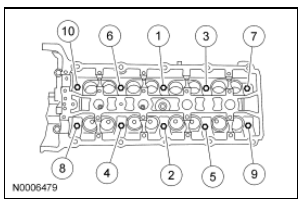
   - Stage 1: Tighten bolts 1 through 10 to 20 Nm (15 lb-ft).
   - Stage 2: Tighten bolts 1 through 10 to 35 Nm (26 lb-ft).
   - Stage 3: Tighten bolts 1 through 10 to 45 Nm (33 lb-ft) and an additional 90 degrees.
   - Stage 4: Tighten bolts 1 through 10 an additional 90 degrees.



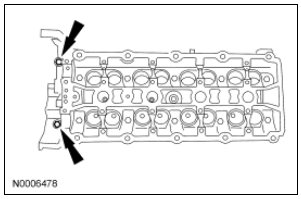
5. Install the 2 bolts and tighten in 2 stages.
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



6. Install and tighten the LH head bolts in 4 stages in the sequence shown.
   - Stage 1: Tighten bolts 1 through 10 to 20 Nm (15 lb-ft).
   - Stage 2: Tighten bolts 1 through 10 to 35 Nm (26 lb-ft).
   - Stage 3: Tighten bolts 1 through 10 to 45 Nm (33 lb-ft) and an additional 90 degrees.
   - Stage 4: Tighten bolts 1 through 10 an additional 90 degrees.

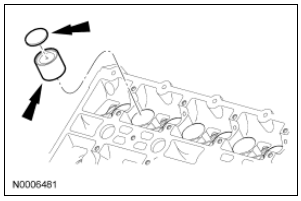


7. Install the 2 bolts and tighten in 2 stages.
    - Stage 1: Tighten to 20 Nm (15 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



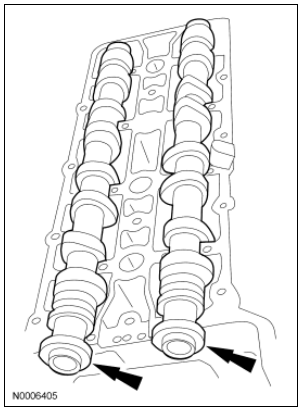
8. **NOTE:** Coat the valve tappets with clean engine oil prior to installing.

   Install the valve tappets and shims in their original location.



9. **NOTE:** Apply clean engine oil to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

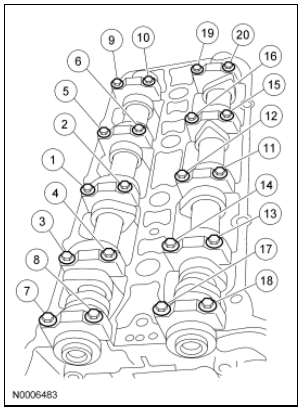
   Position the RH camshafts on the camshaft journals.



10. ⚠ **CAUTION: Install the camshaft bearing caps. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage can occur.**

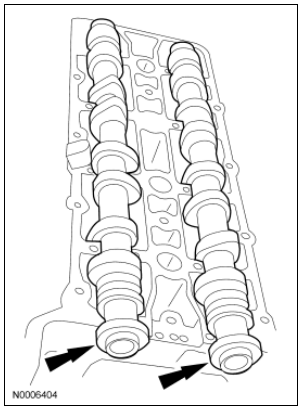
    Install the RH camshaft bearing caps.

    - Position the bearing caps.
    - Install the bearing cap bolts. Tighten the bolts in 3 stages in the sequence shown.
        - ♦ Stage 1: Hand-tighten.
        - ♦ Stage 2: Tighten to 6 Nm (53 lb-in).
        - ♦ Stage 3: Tighten an additional 90 degrees.



11. **NOTE:** Apply clean engine oil to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

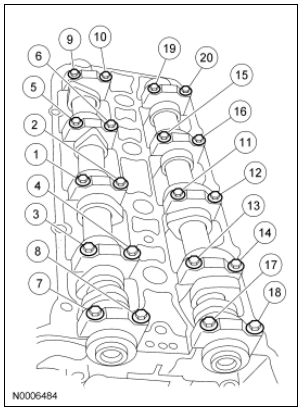
    Position the LH camshafts on the camshaft journals.



12. ⚠ **CAUTION: Install the camshaft bearing caps. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage can occur.**

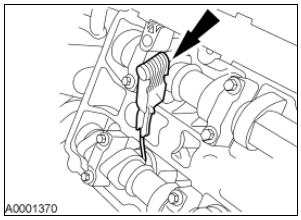
    Install the LH camshaft bearing caps.

    - Position the bearing caps.
    - Install the bearing cap bolts. Tighten the bolts in 3 stages in the sequence shown.
        - ♦ Stage 1: Hand-tighten.
        - ♦ Stage 2: Tighten to 6 Nm (53 lb-in).
        - ♦ Stage 3: Tighten an additional 90 degrees.



13. ⚠ **CAUTION: If any components are installed new, the engine must be reshimmed or engine damage can occur.**

    Using a feeler gauge, confirm that the tappet and shim clearances are within specification. For additional information, refer to Valve Clearance Check in this section.



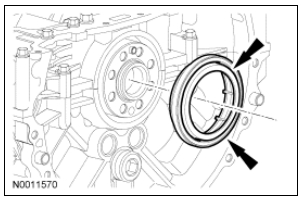
14. If tappet and shim clearances are not within specification, adjust the clearance. For additional information, refer to Valve Clearance Adjustment in this section.

15. Install the engine lifting equipment and remove the engine from the stand.

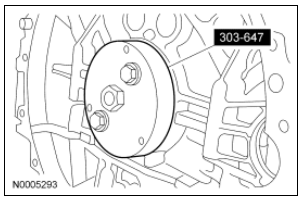
16. ⚠ **CAUTION: The plastic sleeve that comes with the new crankshaft rear oil seal protects the seal while in transit and is also used as an installation tool to prevent lip seal roll when carrying out the repair. The sleeve must be used to prevent future seal concerns.**

    NOTE: Lubricate the cylinder block bore and the crankshaft with clean engine oil before installing the seal.

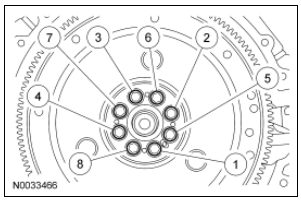
    Position the rear oil seal with protective installer onto the end of the crankshaft.



17. Using the special tool, install the rear main seal.



18. Install the flexplate and tighten the bolts in 2 stages in the sequence shown.
    - Stage 1: Tighten to 15 Nm (11 lb-ft).
    - Stage 2: Tighten to 110 Nm (81 lb-ft).

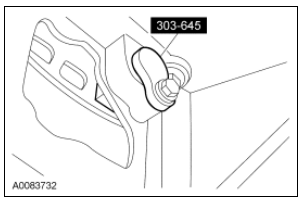


19. Mount the engine on a suitable engine stand.

20. **NOTE:** There is one window on the ignition pulse wheel that is unique to accept the special tool.

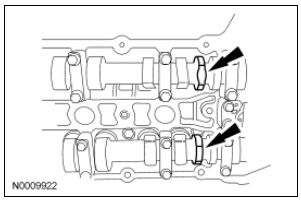
    Install the special tool.

    - Turn the crankshaft to 45 degrees ATDC. The crankshaft keyway will be in the 6 o'clock position.
    - Install the special tool.



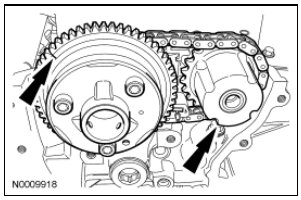
21. **NOTE:** LH shown, RH similar.

    Position all of the camshafts so the flats of the camshafts are facing upward.

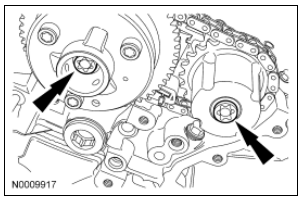


22. Install the LH secondary timing chain tensioner and 2 bolts.
    - Tighten to 11 Nm (8 lb-ft).

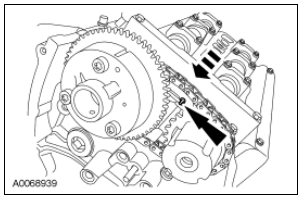
23. Install the LH variable cam timing (VCT) unit, exhaust camshaft sprocket and timing chain as an assembly.



24. Using new bolts, install the LH VCT unit and exhaust camshaft sprocket bolts finger-tight.

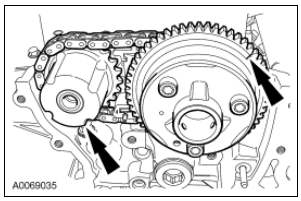


25. Remove the locking pin from the LH secondary timing chain tensioner.

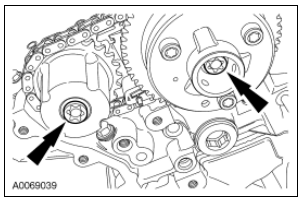


26. Install the RH secondary timing chain tensioner and 2 bolts.
    - Tighten to 11 Nm (8 lb-ft).

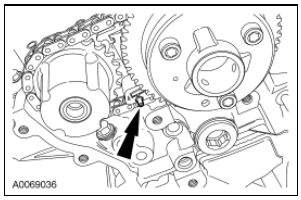
27. Install the RH VCT unit, exhaust camshaft sprocket and timing chain as an assembly.



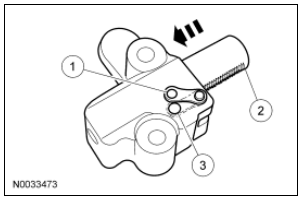
28. Using new bolts, install the RH VCT unit and exhaust camshaft sprocket bolts finger-tight.



29. Remove the locking pin from the RH secondary timing chain tensioner.

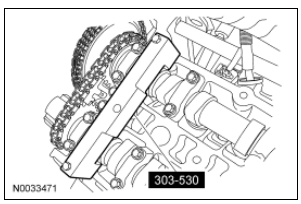


30. Reset the timing chain tensioners.
    1. Hold the lever toward the tensioner piston.
    2. Using finger pressure, compress the tensioner.
    3. Push the lever down and install a drill rod to lock the piston.



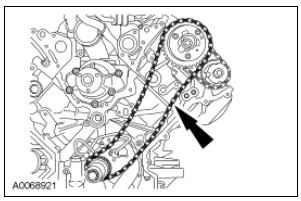
31. ⚠ **CAUTION: The flats on the camshaft must completely contact the special service tool or damage to the camshafts can occur. Slowly draw the special tool down evenly until it is fully seated on the camshaft flats.**

    Install the special tool on the LH head.

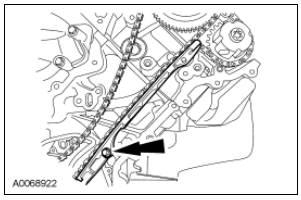


32. Position the LH timing chain and crankshaft gear.
    - Position the timing chain over the LH intake camshaft sprocket.

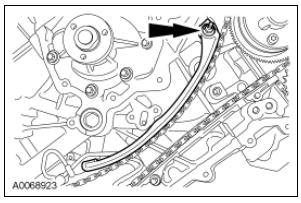
- Position the crankshaft gear in the timing chain.



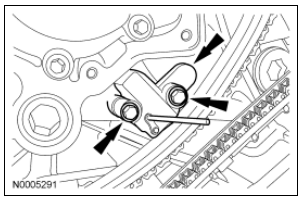
33. Install the LH timing chain guide and bolt.
    - Tighten to 11 Nm (8 lb-ft).



34. Install the LH timing chain tensioner arm and nut.
    - Tighten to 11 Nm (8 lb-ft).



35. Install the LH timing chain tensioner.
    - Install the timing chain tensioner and bolts, and remove the drill rod.

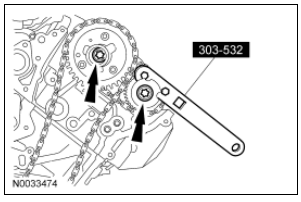


36. **⚠ CAUTION: The exhaust camshaft sprocket bolt must be fully tightened before tightening the intake camshaft sprocket bolt.**

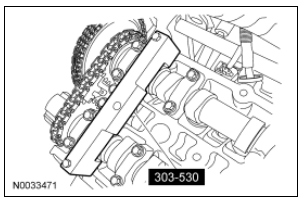
    ⚠ CAUTION: Using the special tool, apply 10 Nm (89 lb-in) counterclockwise to the LH exhaust camshaft sprocket.

    Tighten the LH exhaust camshaft sprocket and variable camshaft timing (VCT) unit bolts in 2 stages.

    - Stage 1: Tighten to 35 Nm (26 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

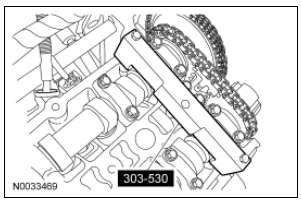


37. Remove the special tool.

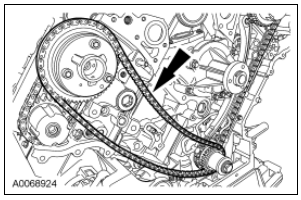


38. ⚠ **CAUTION: The flats on the camshaft must completely contact the special service tool or damage to the camshafts can occur. Slowly draw the special tool down evenly until it is fully seated on the camshaft flats.**

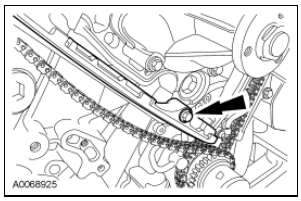
    Install the special tool on the right cylinder head.



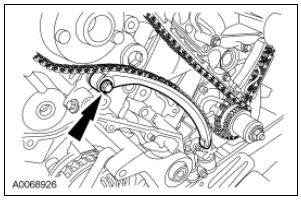
39. Position the RH timing chain over the RH intake camshaft sprocket and over the crankshaft gear.



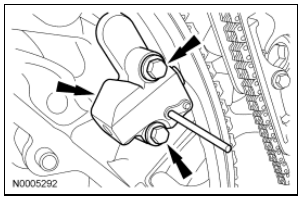
40. Install the RH timing chain guide and bolt.
    - Tighten to 11 Nm (8 lb-ft).



41. Install the RH timing chain tensioner arm.
    - Tighten to 11 Nm (8 lb-ft).



42. Install the RH timing chain tensioner.
    - Install the timing chain tensioner and bolts, and remove the drill rod.

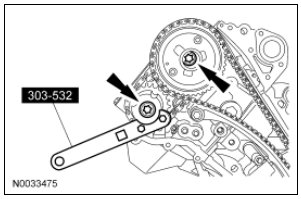


43. ⚠ **CAUTION: The exhaust camshaft sprocket bolt must be fully tightened before tightening the intake camshaft sprocket bolt.**

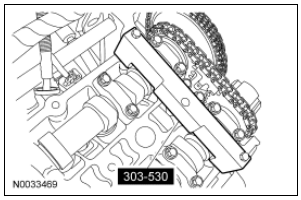
    ⚠ **CAUTION: Using the special tool, apply 10 Nm (89 lb-in) counterclockwise to the RH exhaust camshaft sprocket.**

    Tighten the RH exhaust camshaft sprocket and VCT unit bolts in 2 stages.

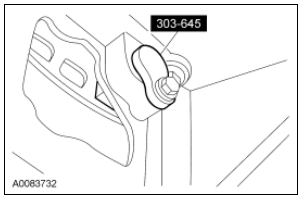
    - Stage 1: Tighten to 35 Nm (26 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



44. Remove the special tool.



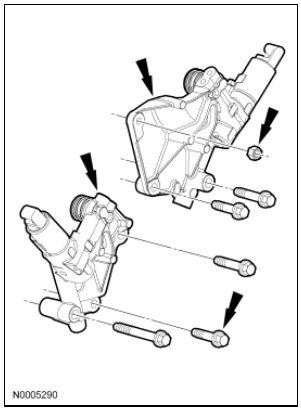
45. Remove the special tool.



46. **NOTE:** Lubricate the VCT bush carrier seals with clean engine oil.

    Carefully insert the bush carrier into the VCT unit, compress ring seals with fingers as required. Fully seat the bush carrier by hand before fitting the bolts and nut.

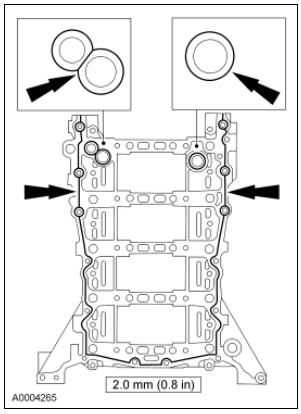
    - Tighten the bolts to 20 Nm (15 lb-ft).
    - Tighten the nut to 10 Nm (89 lb-in).



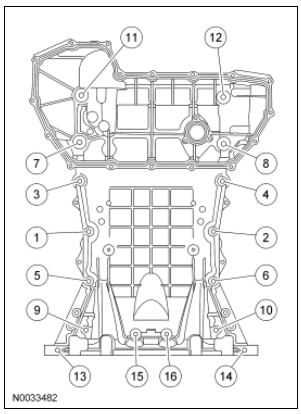
47. ⚠ **CAUTION: Do not use metal scrapers, wire brushes, power abrasive discs or other abrasive means to clean the sealing surfaces. These tools cause scratches and gouges which make leak paths. Use a plastic scraping tool to remove all traces of old sealant.**

    NOTE: If the sump is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply 3 continuous beads of silicone gasket and sealant to the areas shown.

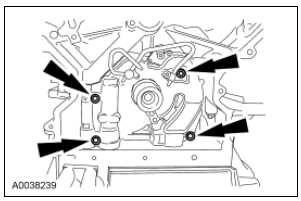


48. Install the oil sump. Using a straightedge, align the sump to the lower cylinder block. Tighten the bolts in sequence in 2 stages.
    - Stage 1: Tighten to 15 Nm (11 lb-ft).
    - Stage 2: Tighten to 25 Nm (18 lb-ft).



49. Install the oil pump and the 4 bolts.

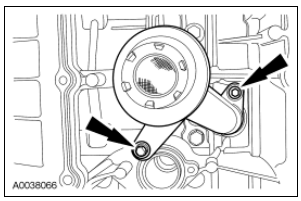
- Tighten to 12 Nm (9 lb-ft).



50. **NOTE:** Inspect the O-ring seal. Install a new O-ring seal if necessary. Lubricate the O-ring seal with clean engine oil.

    Install the oil pump screen cover and tube.

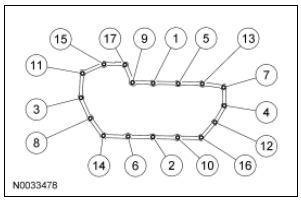
    - Tighten to 12 Nm (9 lb-ft).



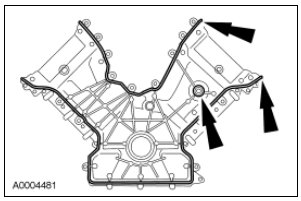
51. **NOTE:** Make sure all gasket sealing surfaces are clean and dry.

    Install a new oil pan gasket, oil pan and 17 bolts.

    - Tighten the bolts in the sequence shown in 2 stages.
        - ♦ Stage 1: Tighten to 5 Nm (44 lb-in).
        - ♦ Stage 2: Tighten to 12 Nm (9 lb-ft).

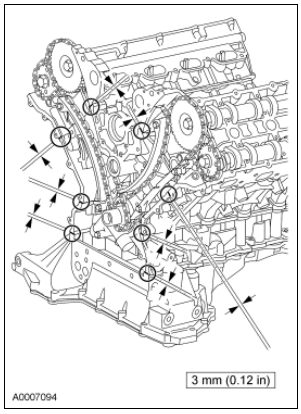


52. Install new engine front cover gaskets.

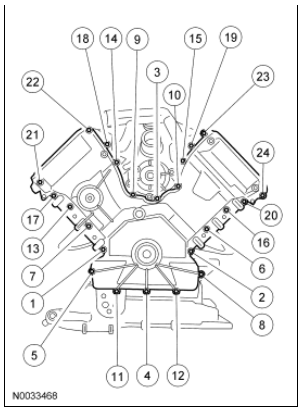


53. **NOTE:** If the front cover is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in the 8 places shown.

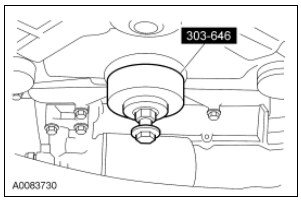


54. Install the engine front cover.
    - Position the engine front cover on the cylinder block.
    - Loosely install the bolts.
    - Tighten the bolts in 2 stages in the sequence shown.
        - Stage 1: Tighten to 5 Nm (44 lb-in).
        - Stage 2: Tighten to 10 Nm (89 lb-in).



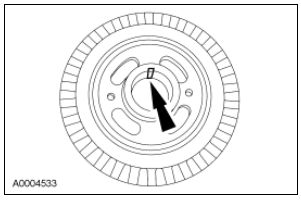
55. **NOTE:** Lubricate the front oil seal and the engine front cover mating surface with clean engine oil.

    Using the special tool, install a new front crankshaft seal.

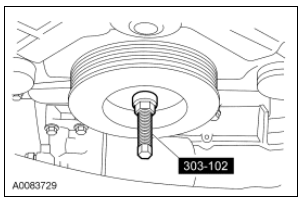


56. **NOTE:** If the crankshaft pulley is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

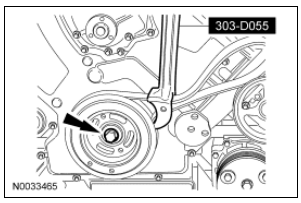
    Apply a bead of silicone gasket and sealant to the keyway.



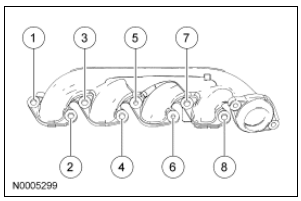
57. Using the special tool, install the crankshaft pulley.



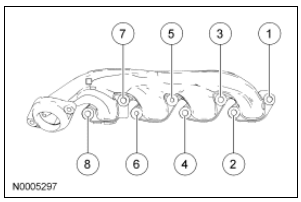
58. Install a new bolt and using the special tool to hold the pulley, tighten in 4 stages.
    - Stage 1: Tighten to 80 Nm (59 lb-ft).
    - Stage 2: Loosen the bolt 2 complete turns.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.



59. Install a new gasket, LH exhaust manifold, spacers and bolts.
    - Tighten the bolts to 25 Nm (18 lb-ft) in the sequence shown.



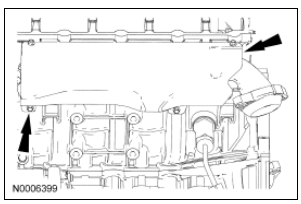
60. Install a new gasket, RH exhaust manifold, spacers and bolts.
    - Tighten the bolts to 25 Nm (18 lb-ft) in the sequence shown.



61. **NOTE:** LH shown, RH similar.

    Install the 2 exhaust manifold heat shields and 8 bolts.

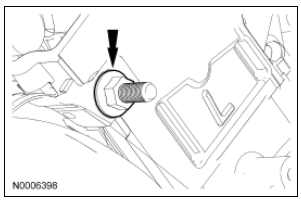
    - Tighten to 3 Nm (27 lb-in).



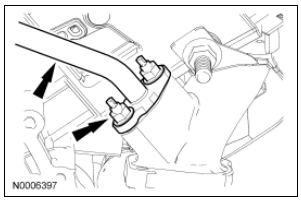
62. **NOTE:** LH shown, RH similar.

Install the 2 exhaust manifold heat shield stud bolts.

- Tighten to 50 Nm (37 lb-ft).

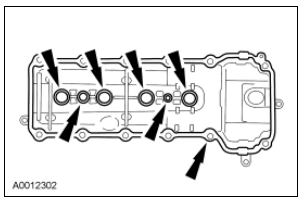


63. Install a new gasket, EGR tube and 2 nuts.
    - Tighten to 20 Nm (15 lb-ft).



64. **NOTE:** RH shown, LH similar.

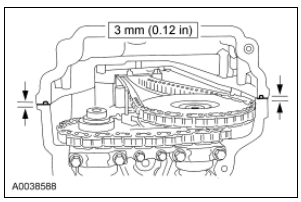
    Install new valve cover gaskets.



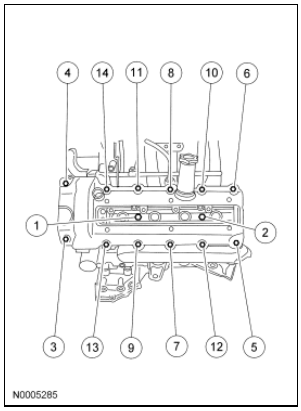
65. **NOTE:** RH shown, LH similar.

    NOTE: If the valve covers are not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

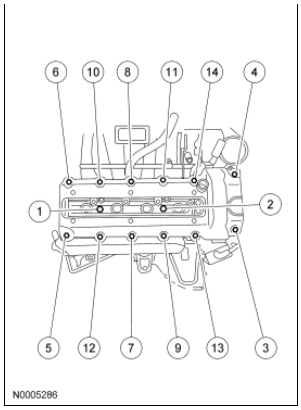
    Apply 4 beads of silicone gasket and sealant as shown.



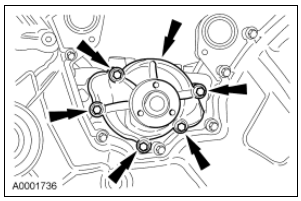
66. Install the LH valve cover.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).



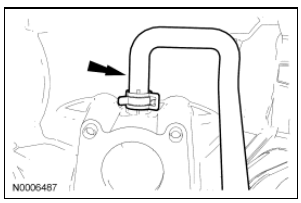
67. Install the RH valve cover.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).



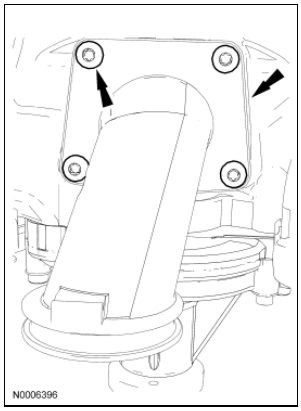
68. Install a new gasket and the coolant pump.
    - Install the 5 bolts and tighten in 2 stages.
        - ♦ Stage 1: Tighten to 8 Nm (71 lb-in).
        - ♦ Stage 2: Tighten an additional 90 degrees.



69. Install the throttle body coolant hose.

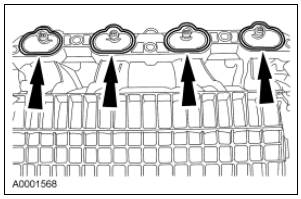


70. Install a new O-ring seal, the coolant inlet housing and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

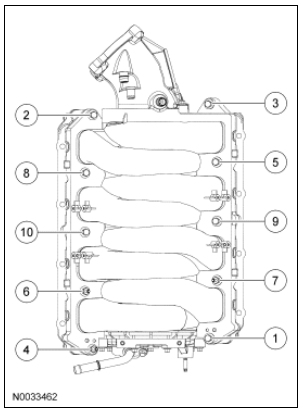


71. Install new O-ring seals, the coolant bypass housing and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

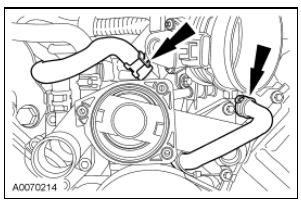
72. Install new intake manifold gaskets.



73. Install the intake manifold, the 7 bolts and the 3 studs.
    - Tighten the 7 bolts and the 3 studs in the sequence shown to 20 Nm (15 lb-ft).



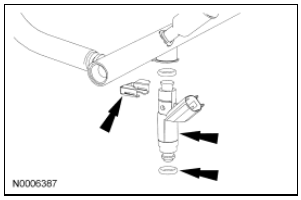
74. Connect the 2 throttle body coolant hoses.



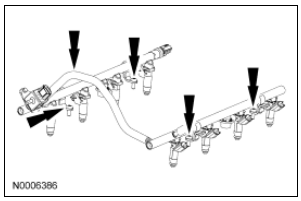
75. ⚠ **CAUTION: Use O-ring seals that are made of special fuel-resistant material. Use of ordinary O-rings can cause the fuel system to leak. Do not reuse the O-ring seals.**

    Install 16 new O-ring seals onto the fuel injectors.

    - Lubricate the O-ring seals with clean engine oil.
    - Install the fuel injectors and clips onto the fuel rail.



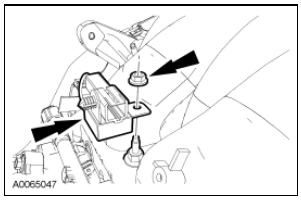
76. Install the fuel rail and injector assembly and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



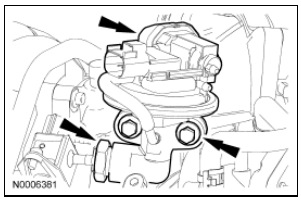
77. **NOTE:** RH shown, LH similar.

    Install the 2 radio interference ignition capacitors and nuts.

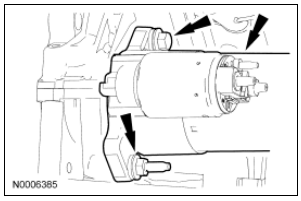
    - Tighten to 10 Nm (89 lb-in).



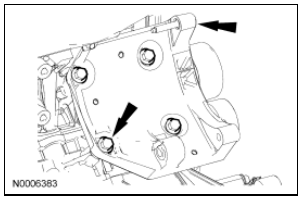
78. Install a new gasket, the exhaust gas recirculation (EGR) system module and bolts.
    - Tighten the bolts to 25 Nm (18 lb-ft).
    - Tighten the EGR tube nut to 40 Nm (30 lb-ft).



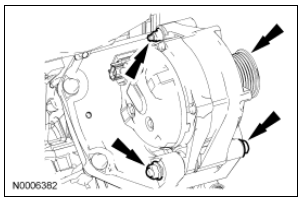
79. Install the starter motor and 2 bolts.
    - Tighten to 25 Nm (18 lb-ft).



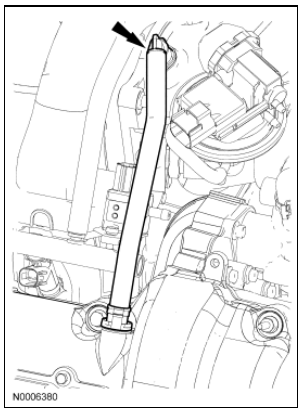
80. Install the generator bracket and 4 bolts.
    - Tighten to 42 Nm (31 lb-ft).



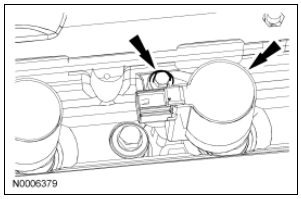
81. Install the generator, the bolt and the 2 nuts.
    - Tighten to 40 Nm (30 lb-ft).



82. Install the crankcase vent tube.



83. Install the 8 ignition coils and bolts.
    - Tighten to 5 Nm (44 lb-in).

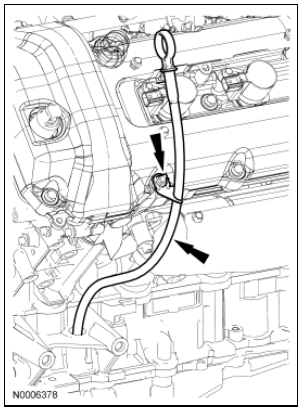


84. **⚠ CAUTION: Failure to lubricate the O-ring seal and the oil level indicator tube-to-engine block mating surface with clean engine oil can result in engine oil leaks.**

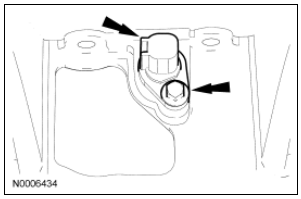
    ⚠ CAUTION: Make sure the O-ring seal remains in position and does not roll up the indicator tube during installation.

    Install a new O-ring seal, oil level indicator tube and nut.

    - Lubricate the new O-ring seal and engine mating surface with clean engine oil.
    - Tighten to 6 Nm (53 lb-in).

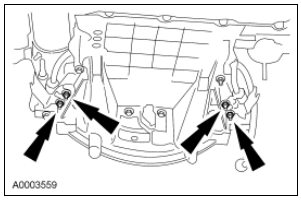


85. Install the crankshaft position (CKP) sensor and bolt.
    - Tighten to 10 Nm (89 lb-in).

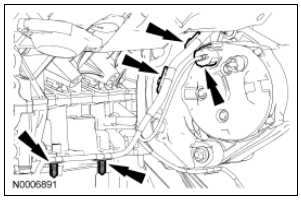


86. Position the engine wiring harness onto the engine.

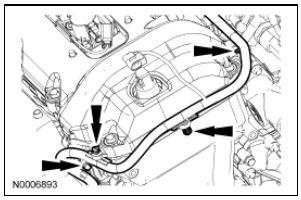
87. Attach the heated oxygen sensor (HO2S) electrical connectors onto the brackets.



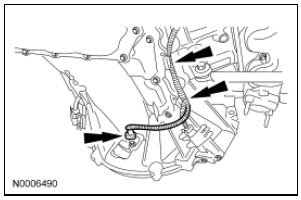
88. Connect the generator electrical connector and wiring harness retainers.



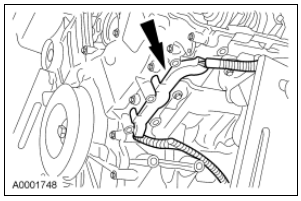
89. Connect the wiring harness retainers to the RH valve cover.



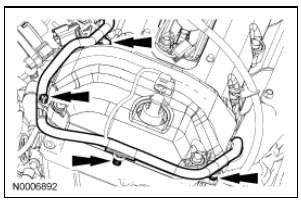
90. Connect the CKP sensor electrical connector and wiring harness retainers.



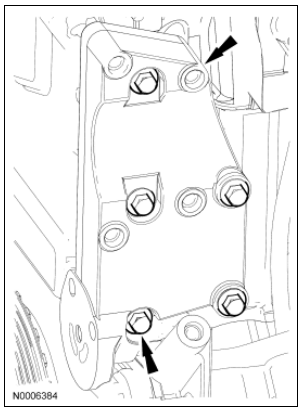
91. Attach the wiring harness onto the front cover.



92. Connect the wiring harness retainers to the LH valve cover.

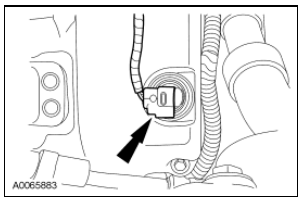


93. Install the power steering bracket and 5 bolts.
    - Tighten to 25 Nm (18 lb-ft).

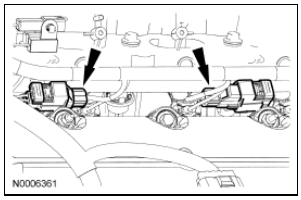


94. **NOTE:** RH shown, LH similar.

    Connect the 2 VCT sensor electrical connectors.

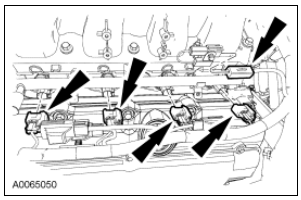


95. Connect the KS and CMP sensor electrical connectors.
    - Attach the pin-type retainers.



96. **NOTE:** LH shown, RH similar.

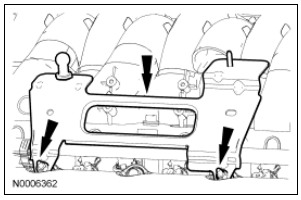
    Connect the 8 fuel injectors and the 2 radio interference capacitor electrical connectors.



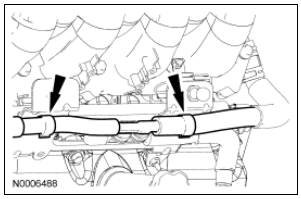
97. **NOTE:** RH shown, LH similar.

    Install the 2 engine appearance cover brackets and the 4 nuts.

    - Tighten to 6 Nm (53 lb-in).

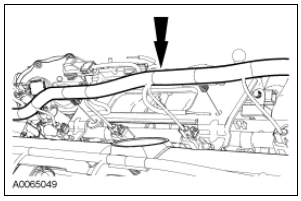


98. Attach the vacuum hose retainers onto the LH engine appearance cover support bracket.

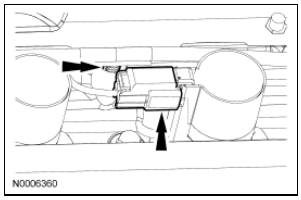


99. **NOTE:** LH shown, RH similar.

    Connect the engine wiring harness retainers to the engine appearance cover support brackets.

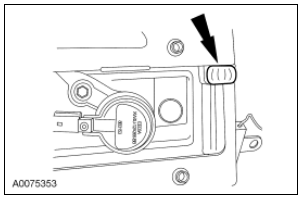


100. Connect the 8 ignition coil electrical connectors.

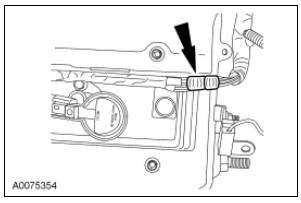


101. **NOTE:** Remove all dirt and moisture from the valve cover before applying silicone sealer.

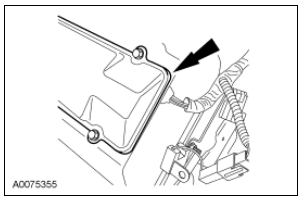
    Lift up the wire harness and apply a 12.7 mm (0.5 in) bead of silicone sealer in the notch of the valve cover.



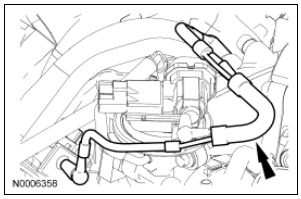
102. Set the ignition coil harness in the bead of silicone sealer and apply enough additional sealer to surround the wiring harness and notch.



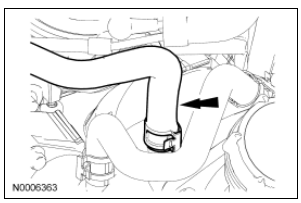
103. Install the ignition coil covers.
    - Tighten to 10 Nm (89 lb-in).



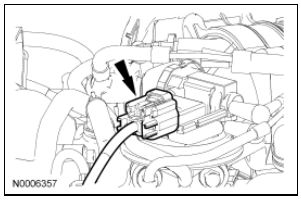
104. Install the vacuum harness.



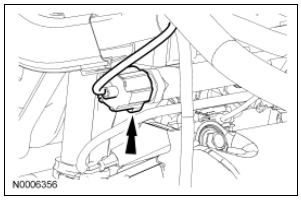
105. Connect the coolant vent hose to the coolant outlet.



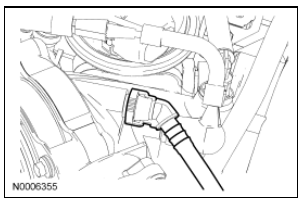
106. Connect the EGR system module electrical connector.



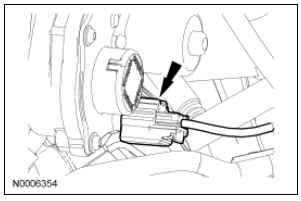
107. Connect the fuel rail temperature sensor electrical connector.



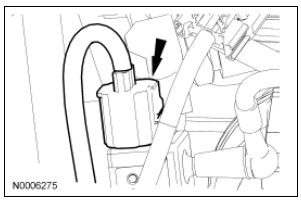
108. Connect the evaporative emissions (EVAP) tube.



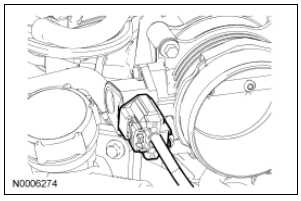
109. Connect the electronic throttle body electrical connector.



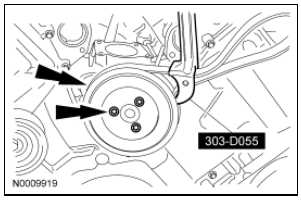
110. Connect the fuel pressure sensor electrical connector.



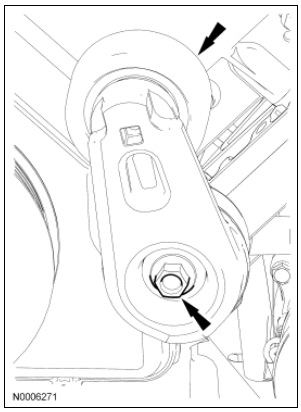
111. Connect the throttle position (TP) sensor electrical connector.



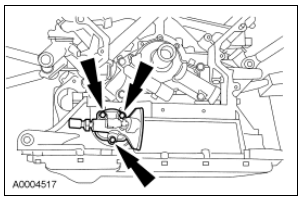
112. Using the special tool, install the coolant pump pulley and 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



113. Remove the bolt and the accessory drive belt tensioner.
    - Tighten to 25 Nm (18 lb-ft).



114. Install new O-ring seals, the oil filter adapter and 3 bolts.
    - Tighten to 25 Nm (18 lb-ft).

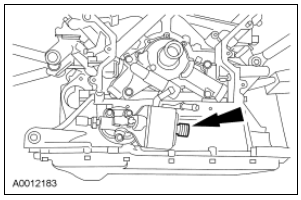


115. ⚠ **CAUTION: A new oil cooler must be installed or severe damage to the engine can occur.**

    NOTE: Lubricate the gasket with clean engine oil.

    Position the new oil cooler, new gasket and install the bolt.

    - Rotate the cooler clockwise until the locating pin hits the stop.
    - Tighten the bolt to 60 Nm (44 lb-ft).

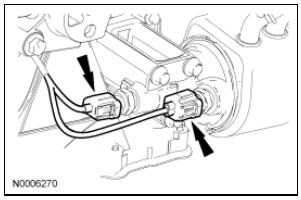


116. **NOTE:** Lubricate the gasket with clean engine oil.

    Install a new oil filter and gasket until the seal makes contact.

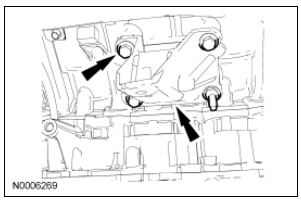
    - Using an oil filter strap wrench, tighten the filter an additional 270 degrees.

117. Connect the oil pressure and oil temperature sensor electrical connectors.

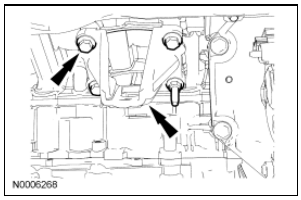


118. Install the engine block drain plug.
    - Tighten to 50 Nm (37 lb-ft).

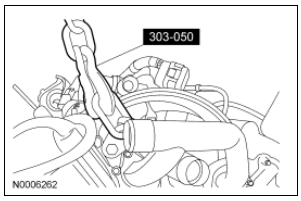
119. Install the LH engine mount bracket, stud bolt and 3 bolts.
    - Tighten to 40 Nm (30 lb-ft).



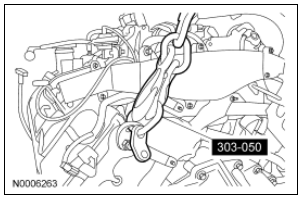
120. Install the RH engine mount bracket, stud bolt and 3 bolts.
    - Tighten to 40 Nm (30 lb-ft).



121. Install the special tool.



122. Install the special tool.



123. Install the engine lifting equipment and remove the engine from the stand.

Material

Item	Specification
Motorcraft Metal Surface Cleaner ZC-21	WSE-M5B392-A
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (in Canada Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12) or equivalent	WSS-M2C930-A

⚠ CAUTION: The gasket sealing surfaces on the cylinder head and cylinder block must be clean and dry.

⚠ CAUTION: The use of sealing aids (aviation cement, copper spray and glue) is not permitted. The gasket must be installed dry.

⚠ CAUTION: The new gasket has a film coating which is crucial to the gasket's ability to seal correctly. Do not scratch the gasket.

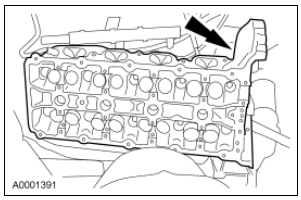
⚠ CAUTION: Cylinder head machining or milling is not authorized by Ford Motor Company. Cylinder head flatness must be within 0.0254 mm (0.001 in) across a 38.1 mm (1.5 in) square area.

⚠ CAUTION: Do not allow the dowels to scratch the sealing surface of the cylinder head during cylinder head installation.

RH side

1. Lightly oil the new cylinder head bolts and allow to drain for a few minutes before installing.

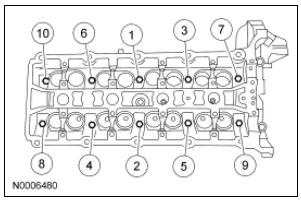
2. Install a new gasket and position the RH cylinder head on the engine.



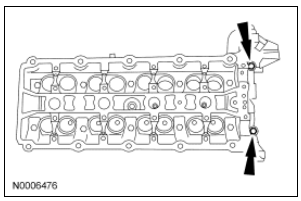
3. **NOTE:** The cylinder head bolts are a torque-to-yield design and must not be reused. Always use new bolts.

   Install and tighten the RH head bolts in 4 stages in the sequence shown.

   - Stage 1: Tighten bolts 1 through 10 to 20 Nm (15 lb-ft).
   - Stage 2: Tighten bolts 1 through 10 to 35 Nm (26 lb-ft).
   - Stage 3: Tighten bolts 1 through 10 to 45 Nm (33 lb-ft) and an additional 90 degrees.
   - Stage 4: Tighten bolts 1 through 10 an additional 90 degrees.



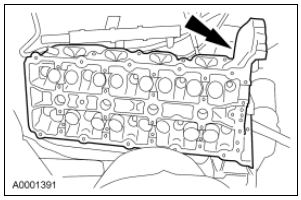
4. Install the 2 end bolts and tighten in 2 stages.
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



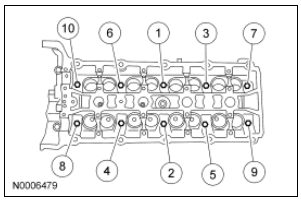
LH side

5. Lightly oil the new cylinder head bolts and allow to drain for a few minutes before installing.

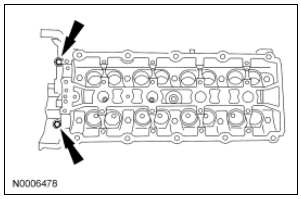
6. Install a new gasket and position the LH cylinder head on the engine.



7. Install and tighten the LH head bolts in 4 stages in the sequence shown.
   - Stage 1: Tighten bolts 1 through 10 to 20 Nm (15 lb-ft).
   - Stage 2: Tighten bolts 1 through 10 to 35 Nm (26 lb-ft).
   - Stage 3: Tighten bolts 1 through 10 to 45 Nm (33 lb-ft) and an additional 90 degrees.
   - Stage 4: Tighten bolts 1 through 10 an additional 90 degrees.



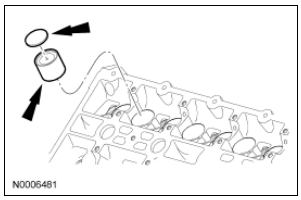
8. Install the 2 end bolts and tighten in 2 stages.
   - Stage 1: Tighten to 20 Nm (15 lb-ft).
   - Stage 2: Tighten an additional 90 degrees.



Both sides

9. **NOTE:** Coat the valve tappets with clean engine oil prior to installing.

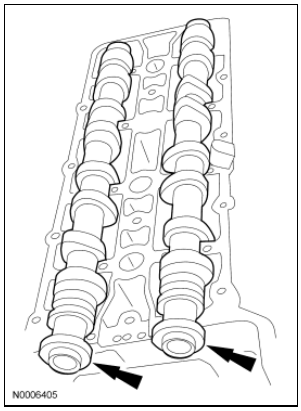
   Install the valve tappets and shims in their original locations.



RH side

10. **NOTE:** Apply clean engine oil to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

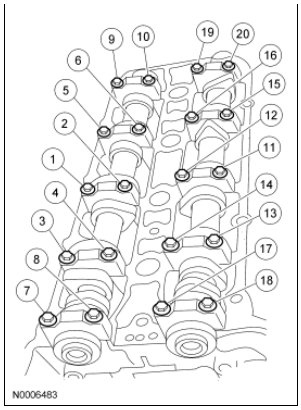
    Position the RH camshafts on the camshaft journals.



11. ⚠ **CAUTION: CAUTION: Install the camshaft bearing caps. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage can occur.**

    Install the RH camshaft bearing caps.

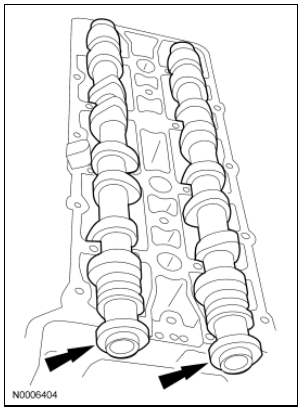
    - Position the bearing caps.
    - Install the bearing cap bolts. Tighten the bolts in 3 stages in the sequence shown.
        - ♦ Stage 1: Hand-tighten.
        - ♦ Stage 2: Tighten to 6 Nm (53 lb-in).
        - ♦ Stage 3: Tighten an additional 90 degrees.



LH side

12. **NOTE:** Apply clean engine oil to the camshaft journals, the camshaft caps and the camshaft lobes prior to installing the camshafts.

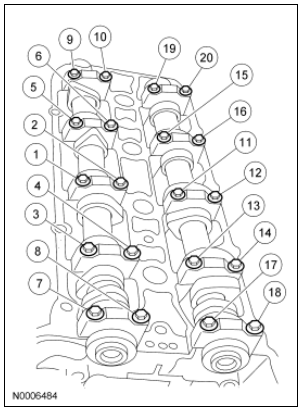
    Position the LH camshafts on the camshaft journals.



13. ⚠ **CAUTION: Install the camshaft bearing caps. The camshaft bearing caps are positional and must be installed in their original locations and orientation or engine damage can occur.**

    Install the LH camshaft bearing caps.

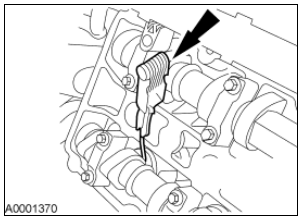
    - Position the bearing caps.
    - Install the bearing cap bolts. Tighten the bolts in 3 stages in the sequence shown.
        - ♦ Stage 1: Hand-tighten.
        - ♦ Stage 2: Tighten to 6 Nm (53 lb-in).
        - ♦ Stage 3: Tighten an additional 90 degrees.



Both sides

14. ⚠ **CAUTION: If any components are installed new, the engine must be reshimmed or engine damage can occur.**

    Using a feeler gauge, confirm that the tappet and shim clearances are within specification. For additional information, refer to Valve Clearance Check in this section.

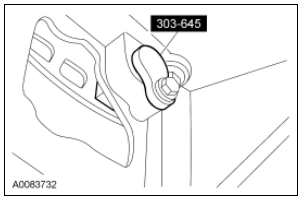


15. If tappet and shim clearances are not within specification, adjust the clearance. For additional information, refer to Valve Clearance Adjustment in this section.

16. **NOTE:** There is one window on the ignition pulse wheel that is unique to accept the special tool.

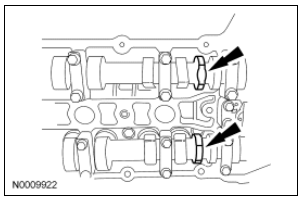
Install the special tool.

- Turn the crankshaft to 45 degrees ATDC. The crankshaft keyway will be in the 6 o'clock position.
- Install the special tool.



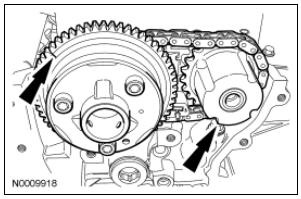
17. **NOTE:** LH shown, RH similar.

    Position all of the camshafts so the flats of the camshafts are facing upward.

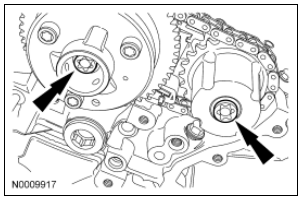


18. Install the LH secondary timing chain tensioner and 2 bolts.
    - Tighten to 11 Nm (8 lb-ft).

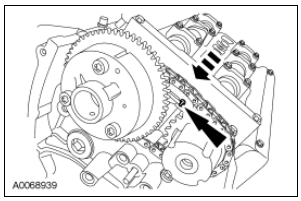
19. Install the LH variable cam timing (VCT) unit, exhaust camshaft sprocket and timing chain as an assembly.



20. Using new bolts, install the LH VCT unit and exhaust camshaft sprocket bolts finger-tight.

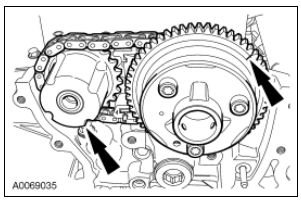


21. Remove the locking pin from the LH secondary timing chain tensioner.

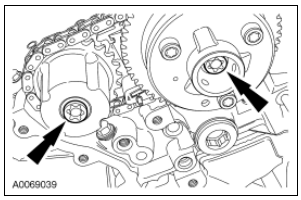


22. Install the RH secondary timing chain tensioner and 2 bolts.
    - Tighten to 11 Nm (8 lb-ft).

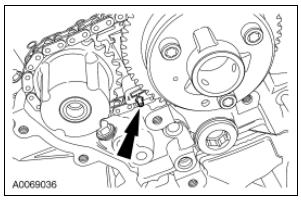
23. Install the RH VCT unit, exhaust camshaft sprocket and timing chain as an assembly.



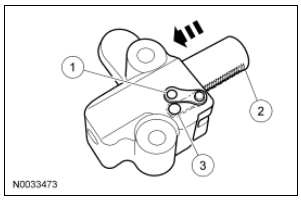
24. Using new bolts, install the RH VCT unit and exhaust camshaft sprocket bolts finger-tight.



25. Remove the locking pin from the RH secondary timing chain tensioner.

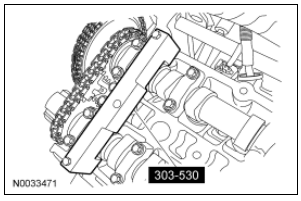


26. Reset the timing chain tensioners.
    1. Hold the lever toward the tensioner piston.
    2. Using finger pressure, compress the tensioner.
    3. Push the lever down and install a drill rod to lock the piston.

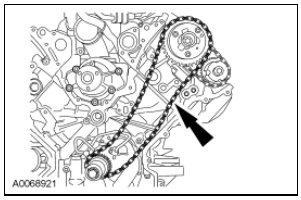


27. ⚠ **CAUTION: The flats on the camshaft must completely contact the special service tool or damage to the camshafts can occur. Slowly draw the special tool down evenly until it is fully seated on the camshaft flats.**

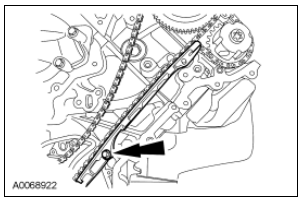
    Install the special tool on the LH head.



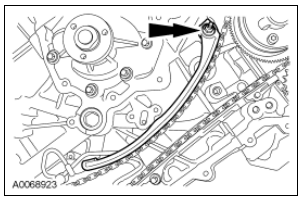
28. Position the LH timing chain and crankshaft gear.
    - Position the timing chain over the LH intake camshaft sprocket.
    - Position the crankshaft gear in the timing chain.



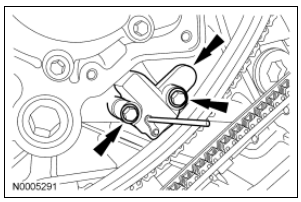
29. Install the LH timing chain guide and bolt.
    - Tighten to 11 Nm (8 lb-ft).



30. Install the LH timing chain tensioner arm and nut.
    - Tighten to 11 Nm (8 lb-ft).



31. Install the LH timing chain tensioner.
    - Install the timing chain tensioner and bolts, and remove the drill rod.

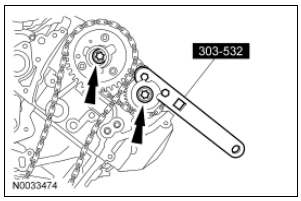


32. **⚠ CAUTION: The exhaust camshaft sprocket bolt must be fully tightened before tightening the intake camshaft sprocket bolt.**

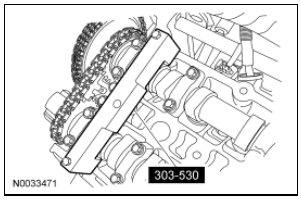
    ⚠ CAUTION: Using the special tool, apply 10 Nm (89 lb-in) counterclockwise to the LH exhaust camshaft sprocket.

    Tighten the LH exhaust camshaft sprocket and variable camshaft timing (VCT) unit bolts in 2 stages.

    - Stage 1: Tighten to 35 Nm (26 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.

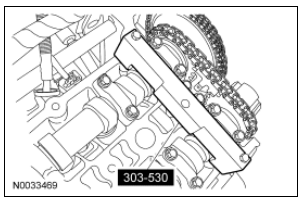


33. Remove the special tool.

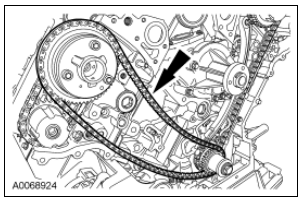


34. ⚠ **CAUTION: The flats on the camshaft must completely contact the special service tool or damage to the camshafts can occur. Slowly draw the special tool downward evenly until it is fully seated on the camshaft flats.**

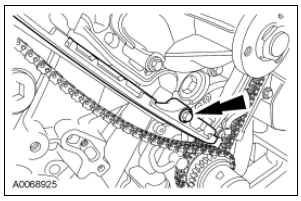
    Install the special tool on the right cylinder head.



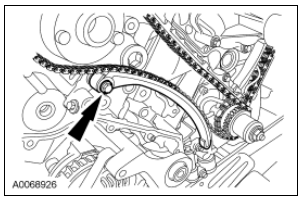
35. Position the RH timing chain over the RH intake camshaft sprocket and over the crankshaft gear.



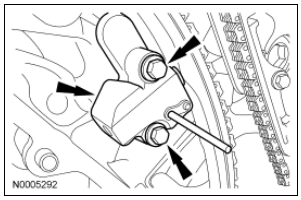
36. Install the RH timing chain guide and bolt.
    - Tighten to 11 Nm (8 lb-ft).



37. Install the RH timing chain tensioner arm.
    - Tighten to 11 Nm (8 lb-ft).



38. Install the RH timing chain tensioner.
    - Install the timing chain tensioner and bolts, and remove the drill rod.

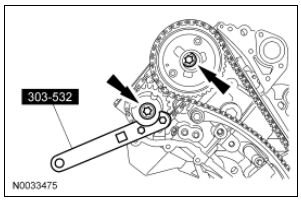


39. **⚠ CAUTION: The exhaust camshaft sprocket bolt must be fully tightened before tightening the intake camshaft sprocket bolt.**

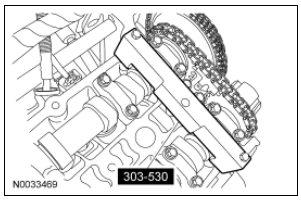
    ⚠ CAUTION: Using the special tool, apply 10 Nm (89 lb-in) counterclockwise to the RH exhaust camshaft sprocket.

    Tighten the RH exhaust camshaft sprocket and VCT unit bolts in 2 stages.

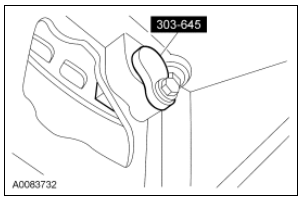
    - Stage 1: Tighten to 35 Nm (26 lb-ft).
    - Stage 2: Tighten an additional 90 degrees.



40. Remove the special tool.



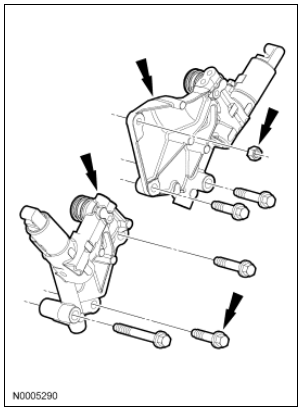
41. Remove the special tool.



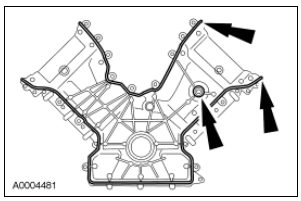
42. **NOTE:** Lubricate the VCT bush carrier seals with clean engine oil.

    Carefully insert the bush carrier into the VCT unit, compress ring seals with fingers as required. Fully seat the bush carrier by hand before fitting the bolts and nut.

    - Tighten the bolts to 20 Nm (15 lb-ft).
    - Tighten the nut to 10 Nm (89 lb-in).

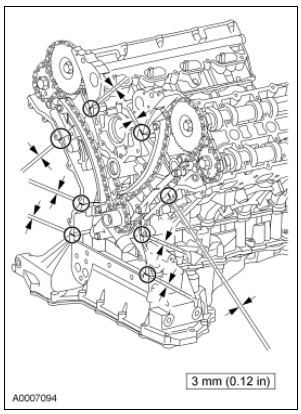


43. Install new engine front cover gaskets.

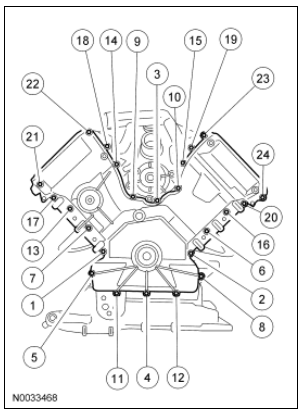


44. **NOTE:** If the front cover is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

    Apply silicone gasket and sealant in the 8 places shown.

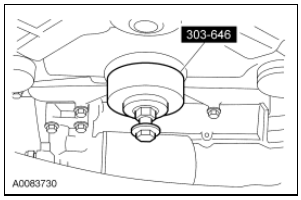


45. Install the engine front cover.
    - Position the engine front cover on the cylinder block.
    - Loosely install the bolts.
    - Tighten the bolts in 2 stages in the sequence shown.
        - Stage 1: Tighten to 5 Nm (44 lb-in).
        - Stage 2: Tighten to 10 Nm (89 lb-in).



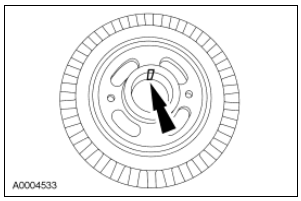
46. **NOTE:** Lubricate the front oil seal and the engine front cover mating surface with clean engine oil.

    Using the special tool, install a new front crankshaft seal.

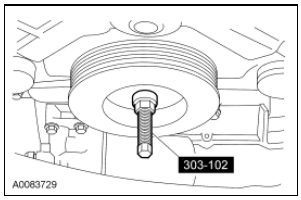


47. **NOTE:** If the crankshaft pulley is not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

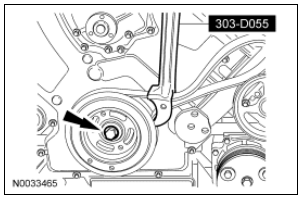
    Apply a bead of silicone gasket and sealant to the keyway.



48. Using the special tool, install the crankshaft pulley.

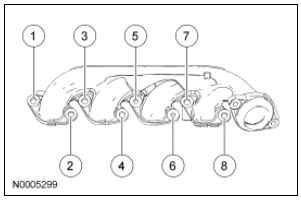


49. Install a new bolt and using the special tool to hold the pulley, tighten in 4 stages.
    - Stage 1: Tighten to 80 Nm (59 lb-ft).
    - Stage 2: Loosen the bolt 2 complete turns.
    - Stage 3: Tighten to 50 Nm (37 lb-ft).
    - Stage 4: Tighten an additional 90 degrees.

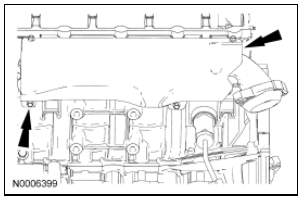


LH side

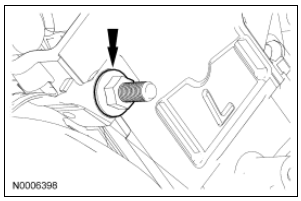
50. Install a new gasket, LH exhaust manifold, spacers and bolts.
    - Tighten the bolts to 25 Nm (18 lb-ft) in the sequence shown.



51. Install the LH exhaust manifold heat shield and 4 bolts.
    - Tighten to 3 Nm (27 lb-in).

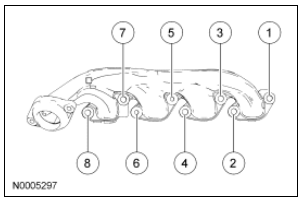


52. Install the LH exhaust manifold heat shield stud bolt.
    - Tighten to 50 Nm (37 lb-ft).

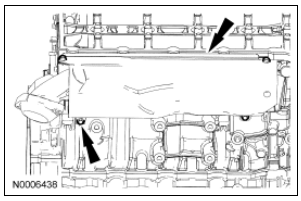


RH side

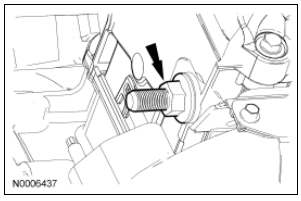
53. Install a new gasket, RH exhaust manifold, spacers and bolts.
    - Tighten the bolts to 25 Nm (18 lb-ft) in the sequence shown.



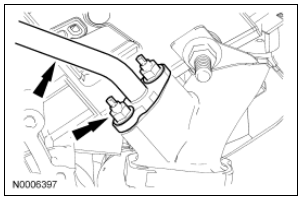
54. Install the RH exhaust manifold heat shield and 4 bolts.
    - Tighten to 3 Nm (27 lb-in).



55. Install the RH exhaust manifold heat shield stud bolt.
    - Tighten to 50 Nm (37 lb-ft).



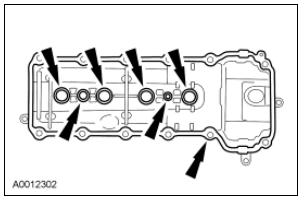
56. Install a new gasket, EGR tube and 2 nuts.
    - Tighten to 20 Nm (15 lb-ft).



Both sides

57. **NOTE:** RH shown, LH similar.

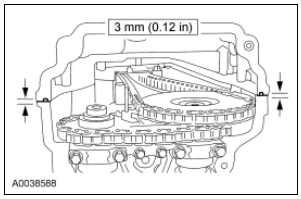
    Install new valve cover gaskets.



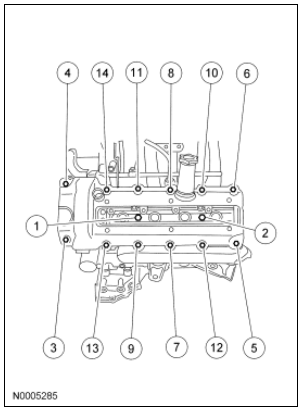
58. **NOTE:** RH shown, LH similar.

    NOTE: If the valve covers are not secured within 4 minutes of sealant application, the sealant must be removed and the sealing area cleaned with metal surface cleaner. Allow to dry until there is no sign of wetness, or 4 minutes, whichever is longer. Failure to follow this procedure can cause future oil leakage.

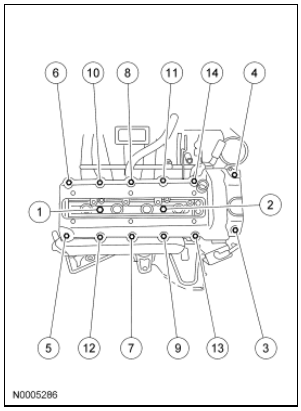
    Apply 4 beads of silicone gasket and sealant as shown.



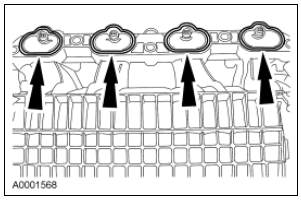
59. Install the LH valve cover.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).



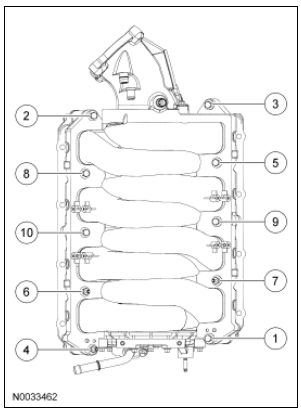
60. Install the RH valve cover.
    - Tighten the bolts in the sequence shown to 10 Nm (89 lb-in).



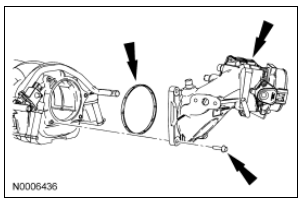
61. Install new intake manifold gaskets.



62. Install the intake manifold, the 7 bolts and the 3 studs.
    - Tighten the 7 bolts and the 3 studs in the sequence shown to 20 Nm (15 lb-ft).

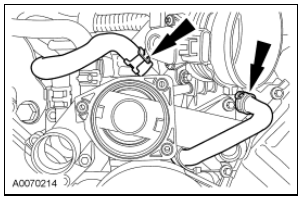


63. Install a new gasket, the throttle body adapter and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).



64. Install new O-ring seals, the coolant bypass housing and the 4 bolts.
    - Tighten to 10 Nm (89 lb-in).

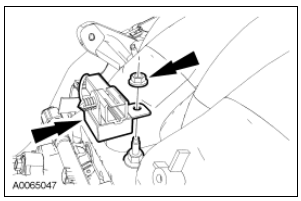
65. Connect the 2 throttle body coolant hoses.



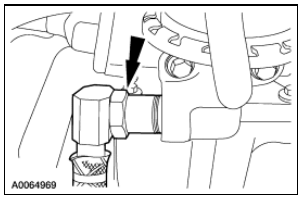
66. **NOTE:** RH shown, LH similar.

    Install the 2 radio interference ignition capacitors and the 2 nuts.

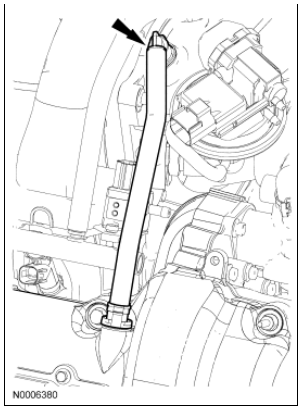
    - Tighten to 10 Nm (89 lb-in).



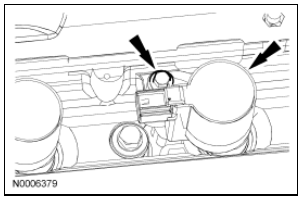
67. Connect the exhaust manifold tube to the exhaust gas recirculation (EGR) system module.
    - Tighten to 40 Nm (30 lb-ft).



68. Install the crankcase vent tube.



69. Install the 8 ignition coils and bolts.
    - Tighten to 5 Nm (44 lb-in).

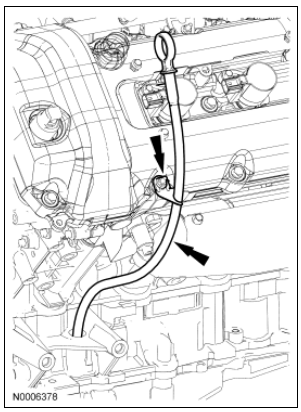


70. ⚠ **CAUTION: Failure to lubricate the O-ring seal and the oil level indicator tube-to-engine block mating surface with clean engine oil can result in engine oil leaks.**

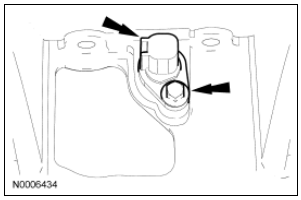
⚠ CAUTION: Make sure the O-ring seal remains in position and does not roll up the indicator tube during installation.

Install a new O-ring seal, oil level indicator tube and nut.

- Lubricate the new O-ring seal and engine mating surface with clean engine oil.
- Tighten to 6 Nm (53 lb-in).

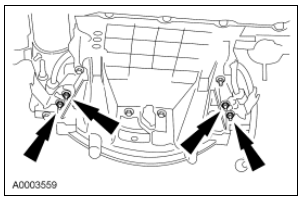


71. Install the crankshaft position (CKP) sensor and bolt.
    - Tighten to 10 Nm (89 lb-in).

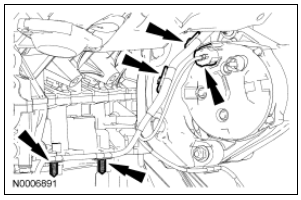


72. Position the engine wiring harness onto the engine.

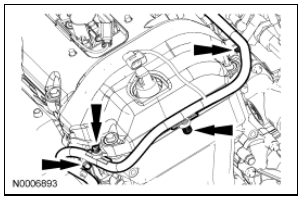
73. Attach the heated oxygen sensor (HO2S) electrical connectors onto the brackets.



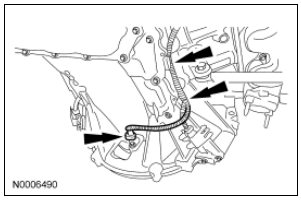
74. Connect the generator electrical connector and wiring harness retainers.



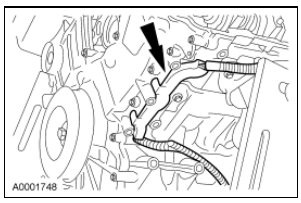
75. Connect the wiring harness retainers to the RH valve cover.



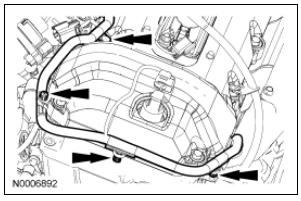
76. Connect the CKP sensor electrical connector and wiring harness retainers.



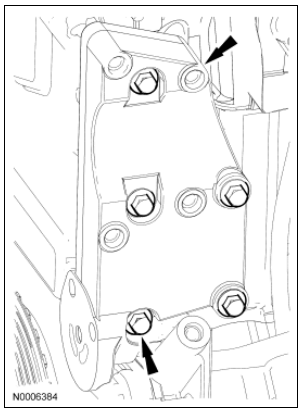
77. Attach the wiring harness onto the front cover.



78. Connect the wiring harness retainers to the LH valve cover.

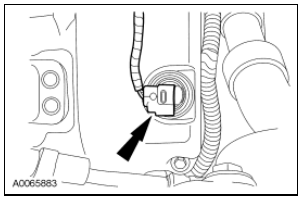


79. Install the power steering bracket and 5 bolts.
    - Tighten to 25 Nm (18 lb-ft).

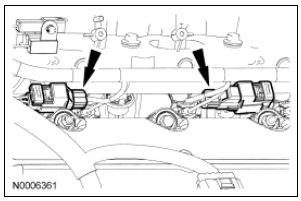


80. **NOTE:** RH shown, LH similar.

    Connect the VCT sensor electrical connectors.

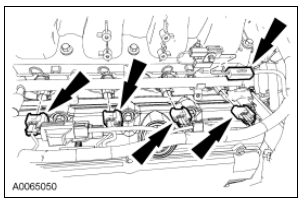


81. Connect the KS and CMP sensor electrical connectors.
    - Attach the pin-type retainers.



82. **NOTE:** LH shown, RH similar.

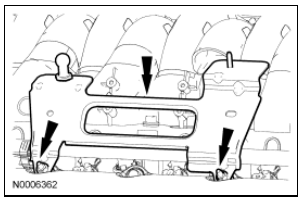
    Connect the 8 fuel injector and the 2 radio interference capacitor electrical connectors.



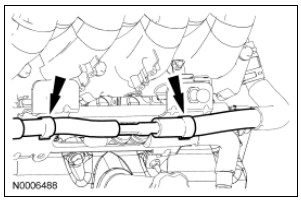
83. **NOTE:** RH shown, LH similar.

    Install the 2 engine appearance cover brackets and the 4 nuts.

    - Tighten to 6 Nm (53 lb-in).

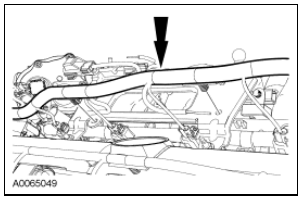


84. Attach the vacuum hose retainers onto the LH engine appearance cover support bracket.

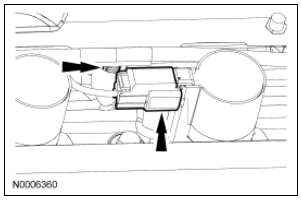


85. **NOTE:** LH shown, RH similar.

    Connect the engine wiring harness retainers to the engine appearance cover support brackets.

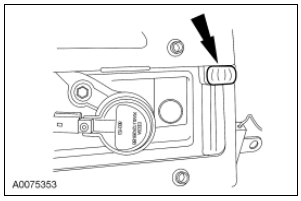


86. Connect the 8 ignition coil electrical connectors.

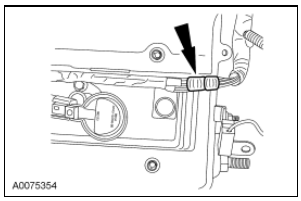


87. **NOTE:** Remove all dirt and moisture from the valve cover before applying silicone sealer.

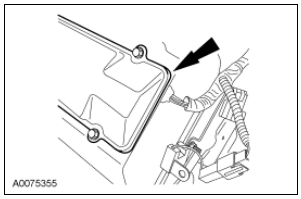
    Lift up the wiring harness and apply a 12.7 mm (0.5 in) bead of silicone sealer in the notch of the valve cover.



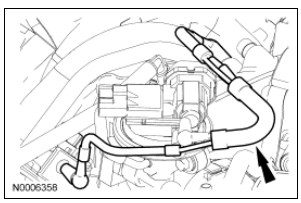
88. Set the ignition coil harness in the bead of silicone sealer and apply enough additional sealer to surround the wire harness and notch.



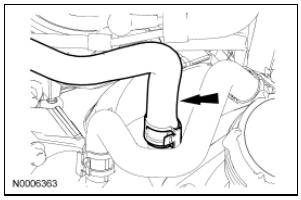
89. Install the ignition coil covers.
    - Tighten to 10 Nm (89 lb-in).



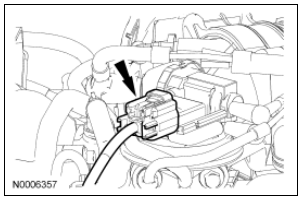
90. Install the vacuum harness.



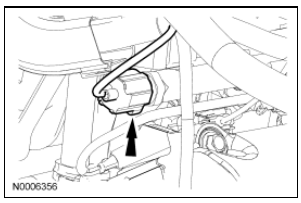
91. Connect the coolant vent hose to the coolant outlet.



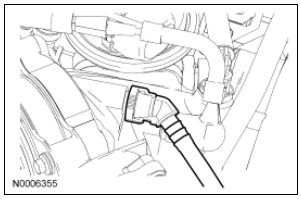
92. Connect the EGR system module electrical connector.



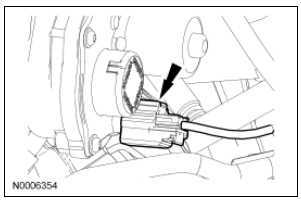
93. Connect the fuel rail temperature sensor electrical connector.



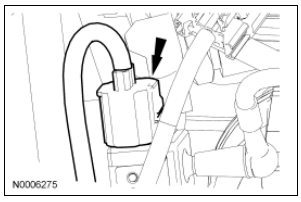
94. Connect the evaporative emissions (EVAP) tube.



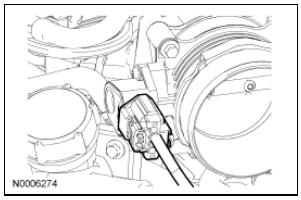
95. Connect the electronic throttle body electrical connector.



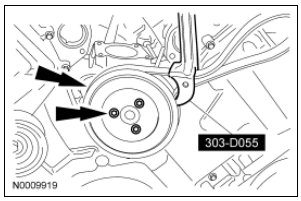
96. Connect the fuel pressure sensor electrical connector.



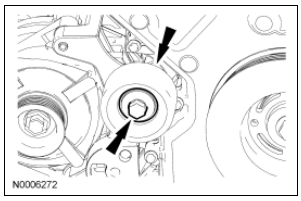
97. Connect the throttle position (TP) sensor electrical connector.



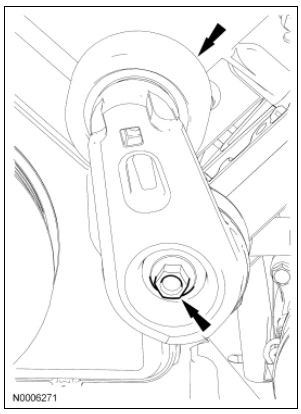
98. Using the special tool, install the coolant pump pulley and 3 bolts.
    - Tighten to 10 Nm (89 lb-in).



99. Install the accessory drive belt idler pulley and bolt.
    - Tighten to 25 Nm (18 lb-ft).



100. Remove the bolt and the accessory drive belt tensioner.
    - Tighten to 25 Nm (18 lb-ft).

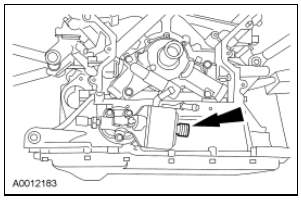


101. ⚠ **CAUTION: A new oil cooler must be installed or severe damage to the engine can occur.**

    NOTE: Lubricate the gasket with clean engine oil.

    Position the new oil cooler, the new gasket and install the bolt.

    - Rotate the cooler clockwise until the locating pin hits the stop.
    - Tighten the bolt to 60 Nm (44 lb-ft).

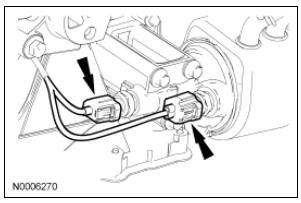


102. **NOTE:** Lubricate the gasket with clean engine oil.

    Install a new oil filter and tighten until the seal makes contact.

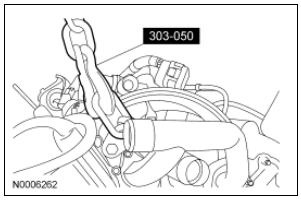
    - Using an oil filter strap wrench, tighten the filter an additional 270 degrees.

103. Connect the oil pressure and oil temperature sensor electrical connectors.

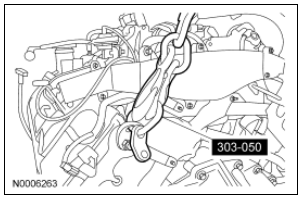


104. Install the engine block drain plug.
    - Tighten to 50 Nm (37 lb-ft).

105. Install the special tool.



106. Install the special tool.



107. Install the engine lifting equipment and remove the engine from the stand.

Engine

 ST1595-A	Lifting Brackets, Engine 303-050 (T70P-6000)
ST1602-A	Spreader Bar 303-D089 (D93P-6001-A3)
ST1293-A	Powertrain Lift With Tilting Plate 014-00765
 ST1702-A	Transmission Support Bracket 014-00341

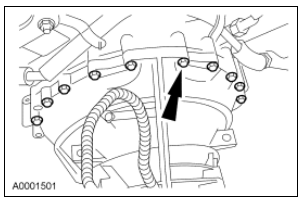
Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (in Canada Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12) or equivalent	WSS-M2C930-A

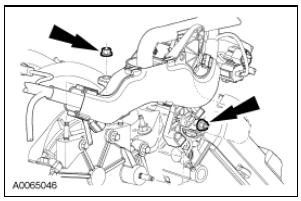
1. **NOTE:** Align the flexplate to converter marks made during engine removal.

   Install the engine to the transmission and install the bolts.

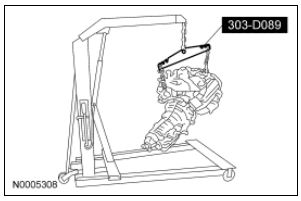
   - Tighten to 47 Nm (35 lb-ft).



2. Position the wiring harness and install the 2 nuts.
   - Tighten to 10 Nm (89 lb-in).



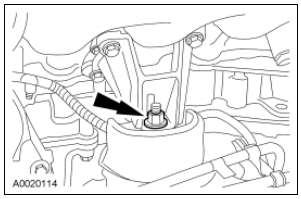
3. Using the special tool and an engine crane, move the engine and transmission onto the crossmember and cooling system assembly.



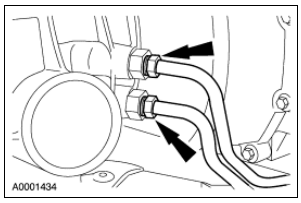
4. **NOTE:** LH shown, RH similar.

   Install the LH and the RH upper engine mount nuts.

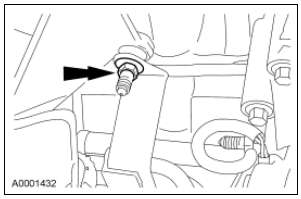
   - Tighten to 50 Nm (37 lb-ft).



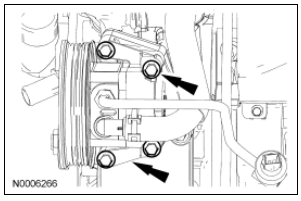
5. Connect the transmission cooler tubes.
   - Tighten to 35 Nm (26 lb-ft).



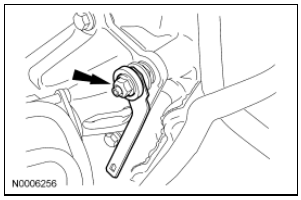
6. Install the transmission cooler tube bracket nut.
   - Tighten to 10 Nm (89 lb-in).



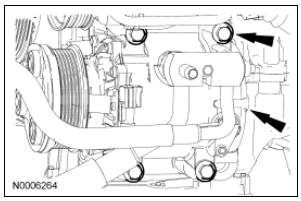
7. Install the power steering pump and 4 bolts.
   - Tighten to 25 Nm (18 lb-ft).



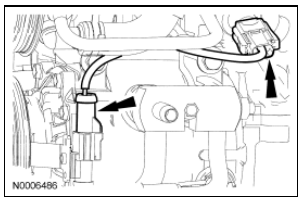
8. Install the power steering tube bracket nut.
   - Tighten to 18 Nm (13 lb-ft).



9. Install the A/C compressor and 4 bolts.
   - Tighten to 25 Nm (18 lb-ft).

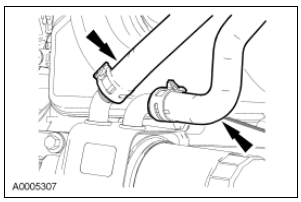


10. Connect the A/C compressor and power steering pressure (PSP) switch electrical connectors.

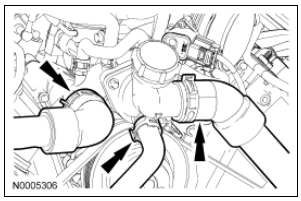


11. Install the accessory drive belt.

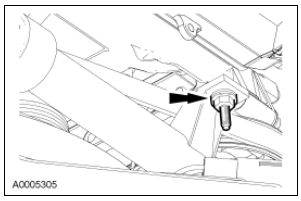
12. Connect the 2 oil cooler hoses, if equipped.



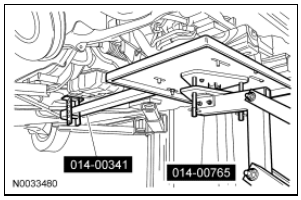
13. Connect the lower radiator, upper radiator and heater hose.



14. Install the lower radiator hose bracket nut.
   - Tighten to 10 Nm (89 lb-in).



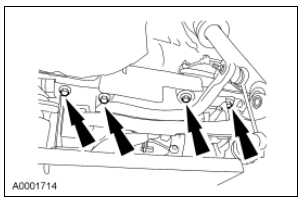
15. Using the powertrain lift and the transmission support bracket, carefully raise the entire assembly into the vehicle.



16. **NOTE:** LH shown, RH similar.

    Install the 4 front crossmember and the 4 center crossmember bolts.

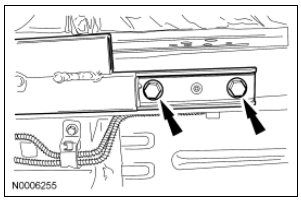
    - Tighten to 103 Nm (76 lb-ft).



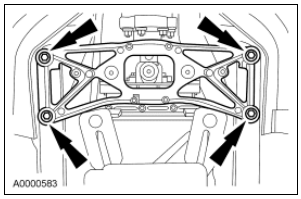
17. **NOTE:** RH shown, LH similar.

    Install the 4 RH and LH center crossmember I-brace bolts.

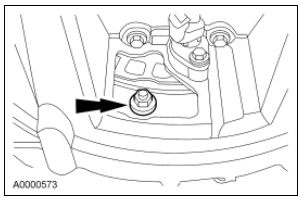
    - Tighten to 103 Nm (76 lb-ft).



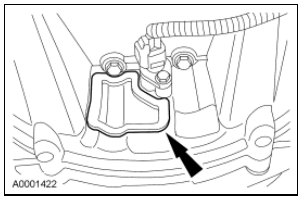
18. Install the 4 transmission support bolts.
    - Tighten to 40 Nm (30 lb-ft).



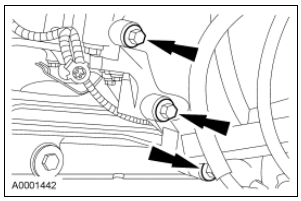
19. Install the 4 torque converter nuts.
    - Tighten to 38 Nm (28 lb-ft).



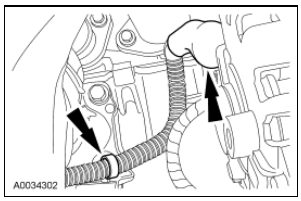
20. Install the cover.



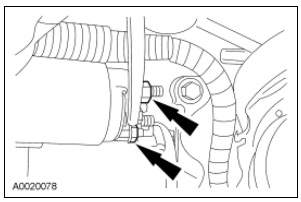
21. Install the 6 lower transmission to engine bolts.
    - Tighten to 47 Nm (35 lb-ft).



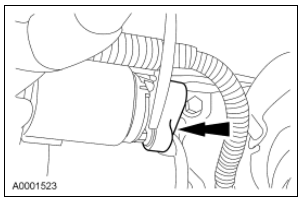
22. Connect the generator electrical connector and pin-type retainer.



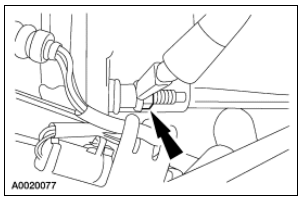
23. Connect the starter motor wiring and install the nuts.
    - Tighten the large nut to 12 Nm (9 lb-ft).
    - Tighten the small nut to 6 Nm (53 lb-in).



24. Install the cover.



25. Install the starter motor ground cable and nut.
    - Tighten the large nut to 25 Nm (18 lb-ft).

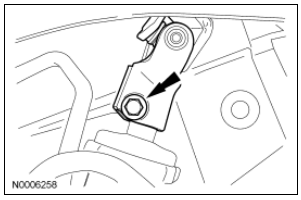


26. ⚠ **CAUTION: Do not allow the steering wheel to rotate while the steering column intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the wheel**

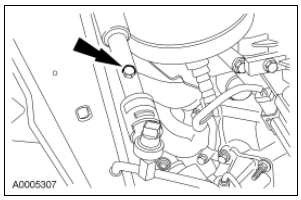
has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .

Connect the steering coupling and install the bolt.

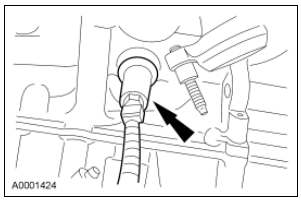
- Tighten to 35 Nm (26 lb-ft).



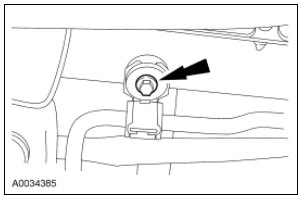
27. Install the steering shaft bolt.
    - Tighten to 30 Nm (22 lb-ft).



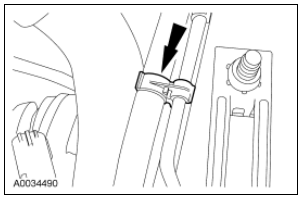
28. Connect the block heater electrical connector, if equipped.



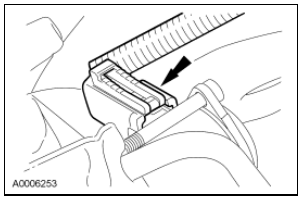
29. Install the retaining bolt for the high pressure power steering hose bracket.
    - Tighten to 10 Nm (89 lb-in).



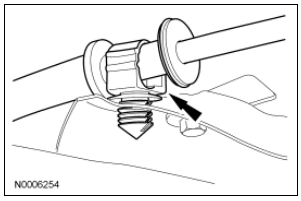
30. Attach the power steering return hose to the pressure hose clip.



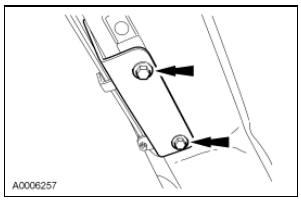
31. Connect the variable assist power steering (VAPS) actuator electrical connector.



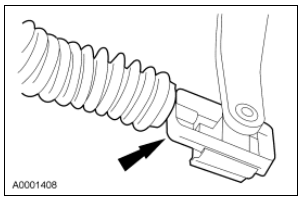
32. Attach the shift cable pin-type retainer to the exhaust heat shield.



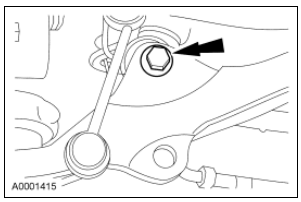
33. Install the shift cable bracket and 2 bolts.
    - Tighten to 10 Nm (89 lb-in).



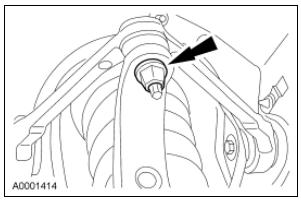
34. Connect the shift cable to the shifter.



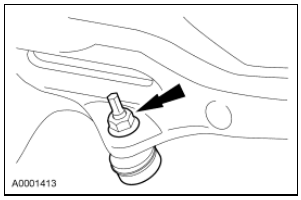
35. Install the 2 strut-to-control arm bolts and nuts.
    - Tighten to 175 Nm (129 lb-ft).



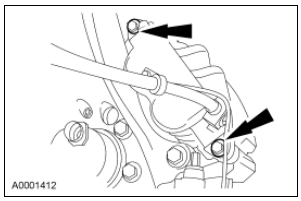
36. Position the upper ball joints into the wheel knuckles and install the 2 nuts.
    - Tighten to 90 Nm (66 lb-ft).



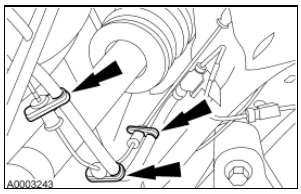
37. Position the stabilizer bar links into the lower control arms and install the 2 nuts.
    - Tighten to 55 Nm (41 lb-ft).



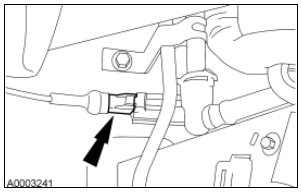
38. Install the front brake calipers and the 4 bolts.
    - Tighten to 35 Nm (26 lb-ft).



39. Attach the RH and LH anti-lock brake sensor harnesses to the brake hose clips.

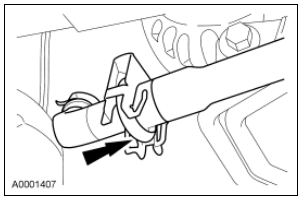


40. Connect the RH and LH anti-lock brake sensor electrical connectors.

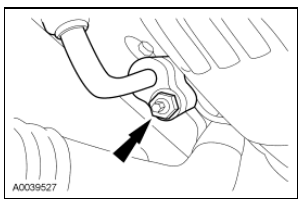


41. Install the RH and LH inner splash shields and pin-type retainers.

42. Connect the low pressure A/C hose.



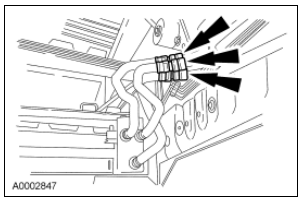
43. Connect the A/C high pressure hose and install the nut.
    - Tighten to 8 Nm (71 lb-in).



44. **NOTE:** The top heater hose has a green identifying mark to match the hose on the dual coolant flow valve. This will aid in the correct installation of the hose assemblies.

NOTE: Hose assemblies shown with components removed for clarity.

Connect the 3 heater hose quick release couplings. For additional information, refer to Section 412-00 .

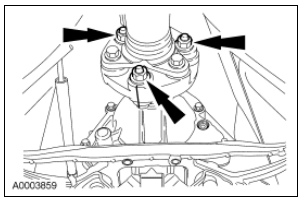


45. ⚠ **CAUTION: Install the bolts, washers and nuts in their original positions or driveshaft NVH can occur. Install the driveshaft flex coupling bolts with the head of the bolt seated against the flange and the nuts seated against the flex coupling.**

    NOTE: The bolt heads are serrated. Hold the bolt and tighten the nut.

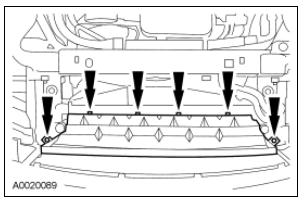
    Install the bolts, washers and nuts.

    - Coat the nut and bolt threads with sealer.
    - Tighten to 81 Nm (60 lb-ft).

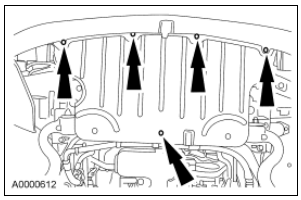


46. Install the catalytic converters. For additional information, refer to Section 309-00 .

47. Install the inner air deflector.

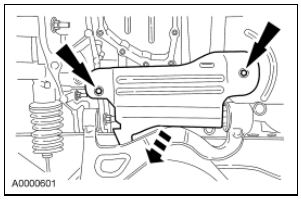


48. Install the center splash shield.

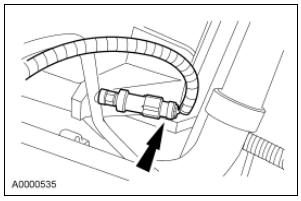


49. **NOTE:** LH shown, RH similar.

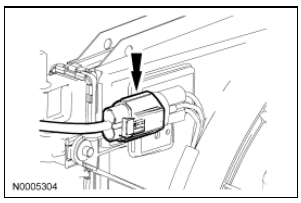
    Install the LH and the RH splash shields.



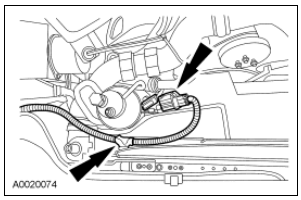
50. Connect the A/C pressure switch electrical connector.



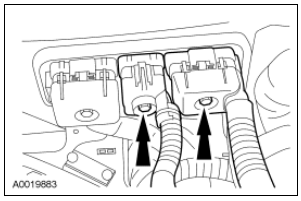
51. Connect the cooling fan electrical connector.



52. Connect the coolant valve electrical connector and attach the wiring harness clip to the radiator support.

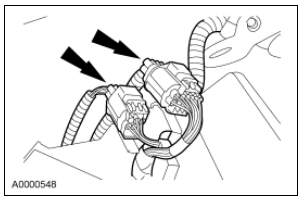


53. Connect the bulkhead electrical connectors.
    - Tighten to 6 Nm (53 lb-in).

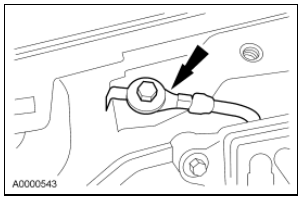


54. **NOTE:** The connectors are located on the backside of the RH strut tower.

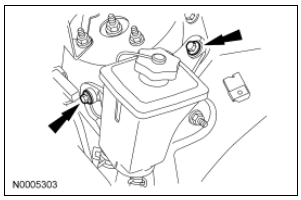
    Connect the engine wiring harness electrical connectors.



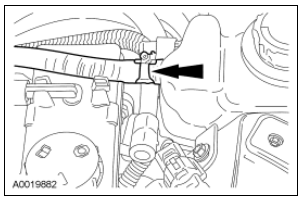
55. Position the ground strap and install the bolt.
    - Tighten to 10 Nm (89 lb-in).



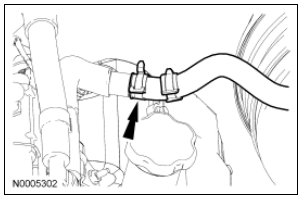
56. Install the power steering reservoir and 2 bolts.
    - Tighten the top bolt to 6 Nm (53 lb-in).
    - Tighten the bottom bolt to 12 Nm (9 lb-ft).



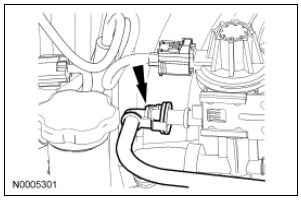
57. Connect the degas bottle hose.



58. Connect the vacuum hose.



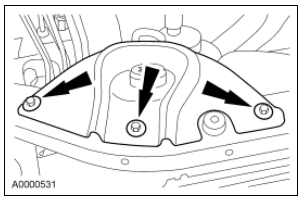
59. Connect the evaporative emissions (EVAP) hose to the EVAP canister purge valve.



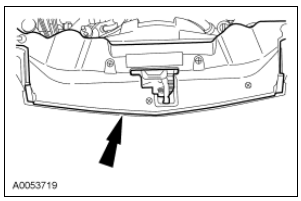
60. **NOTE:** RH shown, LH similar.

    Install the 2 upper radiator support brackets and the 6 bolts.

    - Tighten to 10 Nm (89 lb-in).



61. Install the upper radiator sight shield.



62. Connect the fuel supply tube. For additional information, refer to Section 310-00 .

63. Install the fresh air inlet duct. For additional information, refer to Section 412-01 .

64. Install the air cleaner assembly and outlet pipe. For additional information, refer to Section 303-12 .

65. Connect the battery ground cable. For additional information, refer to Section 414-01 .

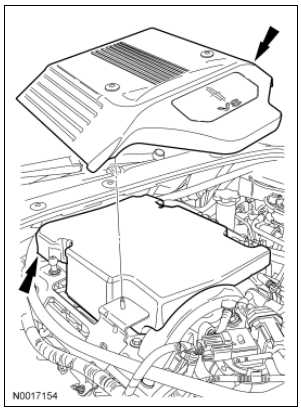
66. Fill the engine with clean engine oil.

67. ⚠ **CAUTION: The coolant fill procedure must be followed exactly or damage to the engine can occur.**

    Fill and bleed the engine cooling system. For additional information, refer to Section 303-03 .

68. ⚠ **CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

    Install the noise suppressor (if detached) and the engine appearance cover.



69. Evacuate and recharge the A/C system. For additional information, refer to Section 412-00 .

General Specifications

Item	Specification
Cooling System Capacity	
3.0L	10.6L (2.8 gallons)
3.9L	11.3L (3.0 gallons)
Coolant Type	
Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada, VC-7-C) or equivalent [a]	WSS-M97B51-A1 (Yellow color)
Other Chemicals	
Motorcraft Premium Cooling System Flush VC-1	ESR-M14P7-A
Premium Long Life Grease XG-1-C	ESA-M1C75-B
Motorcraft Cooling System Stop Leak Pellets VC-6	WSS-M99B37-B6
Cooling System Pressure Test Specifications	
Thermostat Opening Temperatures (3.0L)	
Starts to open	88-92°C (190-198°F)
Fully open	103°C (217°F)
Thermostat Opening Temperatures (3.9L)	
Starts to open	86-90°C (197-194°F)
Fully open	104°C (219°F)

[a] The addition of Motorcraft Cooling System Stop Leak Pellets, VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.

Torque Specifications

Description	Nm	lb-ft	lb-in
Thermostat housing bolts (3.0L)	11	8	
Thermostat housing bolts (3.9L)	10		89
Upper radiator hose retaining bracket bolts (3.9L)	10		89
Coolant pump bolts (3.0L)	25	18	
Intake manifold support bracket (3.0L)	10		89
Coolant pump bolts (3.9L) [a]			
Engine fill cap (3.9L) [a]			
Coolant pump pulley bolts (3.9L) [a]			
Coolant inlet pipe bolts (3.0L)	25	18	
Coolant outlet pipe bolts (3.0L)	10		89
Coolant outlet pipe bolts (3.9L)	10		89
Receiver/drier bracket bolt	11	8	
Coolant control valve bracket bolt	6		53
Auxiliary coolant pump bolts (3.9L)	9		80

Upper radiator support bracket bolts	10		89
Fan shroud bolts	10		89
Condenser-to-radiator bolts	10		89
Condenser support bracket bolts	10		89
Transmission oil cooler bolts	10		89
Degas bottle bolts	6		53
Cross vehicle support bolts	20	15

Engine Cooling

Printable View (288 KB)

⚠ CAUTION: Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada, VC-7-C) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

The cooling system components include the following:

- Block heater (optional)
- Cylinder head temperature sensor
- Fan blade, fan motor and fan shroud assembly
- Radiator
- Pressure relief cap
- Degas bottle
- Radiator draincock
- Coolant pump
- Oil cooler (optional)
- Thermostat

The thermostat:

- controls the engine coolant temperature.
- allows quicker engine warm-up.

The degas bottle:

- provides a location for system fill.
- contains coolant expansion and system pressurization.
- provides air separation during operation.
- replenishes the engine coolant to the system.

The fan blade draws air through the radiator to help cool the engine coolant.

The fan motor:

- operates only when the engine is running.

The engine coolant flows:

- from the lower radiator hose to the coolant pump.
- from the coolant pump to the engine block and the cylinder heads.

A closed thermostat returns the engine coolant to the coolant pump. An open thermostat allows the engine coolant to flow to the radiator.

Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and clean, distilled water.

To maintain the integrity of the cooling system:

- Add Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada, VC-7-C) or equivalent meeting Ford specification WSS-97B51-A1 (yellow color). Do not mix coolant types.
- Do not add/mix Motorcraft Speciality Orange Engine Coolant VC-2 or equivalent meeting Ford specification WSS-M97B44-D (orange color). Mixing coolants can degrade the coolant's corrosion protection.
- Do not add alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.

The cylinder head temperature sensor provides a signal to the temperature gauge and will invoke fail-safe cooling.

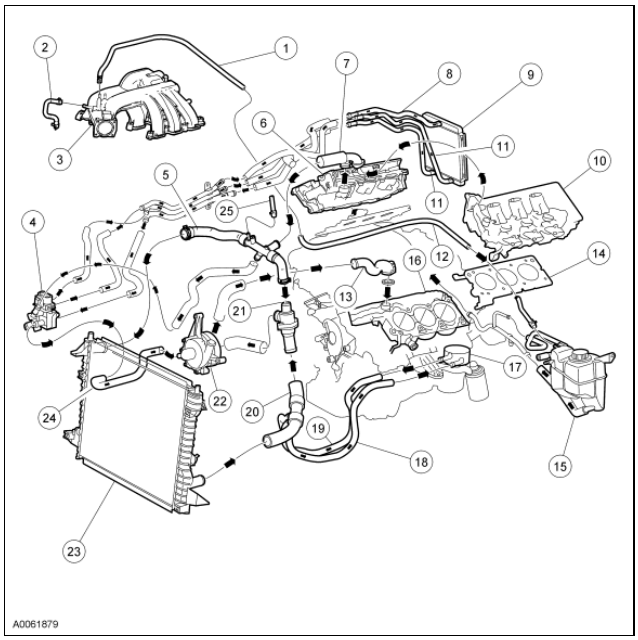
The optional block heater:

- electrical heating element is installed in the block cooling jacket.
    - ♦ uses a standard 110V (220V in Europe) electrical supply.
- keeps the engine coolant warm during cold weather.

The auxiliary coolant pump (3.9L only):

- provides heater coolant flow boost.
- has a secondary function of providing engine-off cooling.

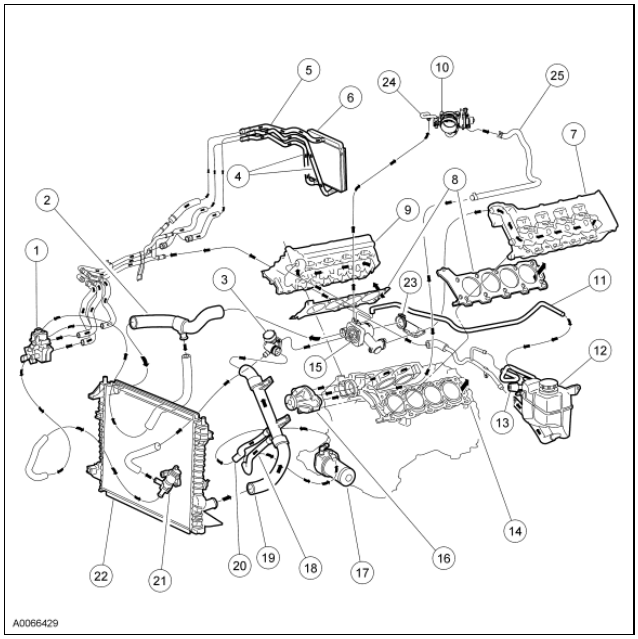
Coolant Flow 3.0L



Item	Part Number	Description
1	8276	From degas vent
2	8B274	Coolant crossover-to-upper intake manifold
3	9424	Upper intake manifold
4	18495	Coolant control valve

5	8260	Upper radiator hose
6	6090	Cylinder head (RH)
7	8548	Coolant outlet pipe
8	18472	Heater outlet hose
9	18476	Heater core
10	6049	Cylinder head (LH)
11	18472	Heater inlet hoses (2 required)
12	9F813	Engine vent hose (to upper intake manifold)
13	8A560	Coolant inlet pipe
14	6051	Cylinder head gasket (2 required)
15	8A080	Degas bottle
16	6009	Cylinder block
17	6A642	Oil cooler
18		Oil cooler inlet hose
19		Oil cooler outlet hose
20	8B273	Lower radiator hose
21	8A856	Thermostat housing
22	8501	Coolant pump
23	8005	Radiator
24		Coolant pump inlet hose
25		From coolant crossover tube

Coolant Flow 3.9L



Item	Part Number	Description
1	18495	Coolant control valve
2	8260	Upper radiator hose
3	8A520	Thermostat housing

4	18472	Heater inlet hoses (2 required)
5	18472	Heater outlet hose
6	18476	Heater core
7	6049	Cylinder head (LH)
8	6051	Cylinder head gasket (2 required)
9	6049	Cylinder head (RH)
10	9E926	Throttle body

Inspection and Verification

⚠ WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).

⚠ CAUTION: Check the coolant level and engine oil, top off the coolant if needed. If there is engine coolant in the engine oil, the cause must be corrected and oil changed or major component damage can occur.

⚠ CAUTION: Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada, VC-7-C) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

1. **NOTE:** The addition of Motorcraft Cooling System Stop Leak Pellets VC-6, darkens Motorcraft Premium Gold Engine Coolant from yellow to golden tan.

   Verify the customer concern by operating the engine to duplicate the condition.

2. Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
• Leaks • Restricted airflow through the condenser/radiator • Damaged hoses • Loose/damaged hose clamps • Damaged coolant gasket • Damaged head gaskets • Damaged coolant pump • Damaged radiator • Damaged degas bottle • Damaged heater core • Damaged or obstructed electric cooling fan	• Damaged cylinder head temperature sensor • Damaged wiring • Fuse • Damaged circuitry

⚠ CAUTION: The cylinder head temperature sensor is not reusable after removal. For electrical concern testing, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

3. If the inspection reveals an obvious concern that can be readily identified, repair it as necessary.

4. Inspect the coolant condition:
    1. Inspect the coolant color.
        - ♦ If Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada VC-7-C) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color) has a clear or pale yellow color, this indicates higher water content than required.
        - ♦ Dark brown could indicate unauthorized stop leak may have been used. Use Motorcraft Cooling System Stop Leak Pellets VC-6 or equivalent meeting Ford specification ESE-M99B37-B5 except as noted in ES-F6SE-19A511-AA.
        - ♦ A light or reddish brown color indicates that rust may be present in the cooling system. Flush the system and refill with the correct mixture of water and Premium Gold Engine Coolant.
        - ♦ An iridescent sheen on the surface of the coolant could indicate a trace of oil is entering the system. For additional information on engine diagnosis, refer to Section 303-00 .
        - ♦ A milky brown color may indicate that engine oil is entering the cooling system. If oil is suspected, the cause of the leak may be internal to the engine. For additional information on engine diagnosis, refer to Section 303-00 .
        - ♦ A milky brown color in the engine oil may indicate that coolant is entering the oil. If coolant is suspected, the cause of the leak may be internal to the engine. For additional information on engine diagnosis, refer to Section 303-00 .
    2. If the engine coolant appearance is acceptable, test the engine coolant freezing point range with the Battery/Antifreeze tester. The freezing point should be in the range -50°F to -10°F. If the vehicle is driven in cold climates less than -34°F, it may be necessary to increase the coolant concentration to get adequate freeze protection.
        - ♦ Maximum coolant concentration is 60/40.
        - ♦ Minimum coolant concentration is 40/60.

3. Adjust coolant range and level if necessary:
    - ♦ If the coolant is low, add specified coolant mixture only.
    - ♦ If the coolant tests weak, add straight engine coolant until the readings are within acceptable levels.
    - ♦ If the coolant tests strong, remove some of the engine coolant and add water until the readings are within acceptable levels.

5. If the concern remains after the inspection, determine the symptom(s). GO to Symptom Chart .

6. Verify the cooling system is correctly filled and bled. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Symptom Chart

Symptom Chart

Pinpoint Tests

PINPOINT TEST A: LOSS OF COOLANT

Test Step	Result / Action to Take
A1 CHECK THE ENGINE COOLANT LEVEL	
NOTE: Allow the engine to cool before checking the engine coolant level. • Key in OFF position. • Visually check the engine coolant level at the degas bottle. • **Is the engine coolant level within specification?**	**Yes** GO to A2 . **No** FILL the engine coolant as necessary. GO to A6 .
A2 CHECK THE DEGAS BOTTLE PRESSURE RELIEF CAP	
⚠ **WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly.** • Inspect the pressure relief cap for foreign material between the sealing gasket and the diaphragm. • **Is the pressure relief cap OK?**	**Yes** GO to A5 . **No** CLEAN or INSTALL a new pressure relief cap. TEST the system for normal operation. GO to A3 .
A3 CHECK THE ENGINE COOLANT FOR INTERNAL LEAK	
⚠ **WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly.**	**Yes** If engine oil is evident, REFER to Section 303-00 . **No** GO to A4 .

• Key in OFF position. • Inspect the engine coolant in the degas bottle for signs of engine oil. • **Is oil evident in the coolant?**	
A4 CHECK THE ENGINE OIL FOR COOLANT	
• Remove the oil level indicator from the engine. • **Is coolant evident in the oil?**	**Yes** If coolant is in the engine, REFER to Section 303-00 . **No** GO to A5 .
A5 PRESSURE TEST THE ENGINE COOLING SYSTEM	
• Pressure test the engine cooling system. Refer to the Component Tests in this section. • **Does the engine cooling system leak?**	**Yes** REPAIR or INSTALL new components. TEST the system for normal operation. **No** The cooling system is operational. GO to Symptom Chart .
A6 CHECK THE DEGAS BOTTLE	
• ⚠ **WARNING: To avoid personal injury, do not unscrew the coolant pressure relief cap while the engine is operating or hot. The cooling system is under pressure; steam and hot liquid can come out forcefully when the cap is loosened slightly.** • **NOTE:** The engine must be cool when coolant is added to the degas bottle. • Add coolant to the degas bottle until fluid is between the coolant fill level marks. • **Does the degas bottle leak?**	**Yes** INSTALL a new degas bottle. REFER to Degas Bottle in this section. TEST the system for normal operation. **No** CARRY OUT the cooling system pressure test. REFER to the Component Tests in this section. REPAIR as necessary. TEST the system for normal operation.

PINPOINT TEST B: THE ENGINE OVERHEATS

Test Step	Result / Action to Take
B1 CHECK THE ENGINE COOLANT LEVEL	
⚠ **WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).** • Key in OFF position. • Check the engine coolant level at the degas bottle.	**Yes** GO to B2 . **No** FILL the engine coolant at the degas bottle. Go To Pinpoint Test A .

• **Is the engine coolant OK?**	
B2 CHECK THE COOLANT CONDITION	
• Check the coolant for contaminants such as rust, corrosion, or discoloration. • **Is the coolant condition OK?**	**Yes** GO to B3 . **No** FLUSH the engine cooling system. REFER to Engine and Radiator Flushing in this section. TEST the system for normal operation.
B3 CHECK FOR AN AIRFLOW OBSTRUCTION	
• Inspect the A/C condenser core and radiator for obstructions such as leaves or dirt. • **Is there an obstruction?**	**Yes** REMOVE the obstruction. CLEAN the A/C condenser core and radiator. TEST the system for normal operation. **No** GO to B4 .
B4 CHECK THE THERMOSTAT OPERATION	
• Key in START position. • Start the engine and allow the engine to run for 10 minutes. • Key in OFF position. • Feel the upper and lower radiator hoses. • **Are the upper and lower radiator hoses cold?**	**Yes** INSTALL a new thermostat. REFER to Thermostat and Thermostat Housing - Exploded View, 3.0L (4V) and Thermostat - 3.0L (4V) or Thermostat - 3.9L in this section. TEST the system for normal operation. **No** GO to B5 .
B5 CHECK THE COOLING FAN OPERATION	
• Carry out the cooling fan diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to diagnose the cooling fan system. • **Is the cooling fan operation OK?**	**Yes** GO to B6 . **No** REPAIR the cooling fan system. REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. TEST the system for normal operation.
B6 CHECK COOLANT PUMP OPERATION	
• Visually inspect coolant pump for rotation and damage.	**Yes** REFER to Section 303-00

• **Is coolant pump OK?**	for diagnosis and testing of the engine. **No** INSTALL a new coolant pump. REFER to Coolant Pump - 3.0L (4V) or Coolant Pump - 3.9L in this section.

PINPOINT TEST C: THE ENGINE DOES NOT REACH NORMAL OPERATING TEMPERATURE

Test Step	Result / Action to Take
C1 CHECK THE ENGINE TEMPERATURE	
• Key in START position. • Start the engine and allow the engine to idle for 10 minutes. • Key in OFF position. • Feel the upper and lower radiator hoses. • **Are the upper and lower radiator hoses cold?**	**Yes** INSTALL a new thermostat. REFER to Thermostat and Thermostat Housing - Exploded View, 3.0L (4V) and Thermostat - 3.0L (4V) or Thermostat - 3.9L in this section. TEST the system for normal operation. **No** REFER to Section 413-01 for diagnosis and testing of the engine coolant temperature gauge.

Component Tests

Pressure Test

1. Turn the engine OFF.

2. Remove the cowl panel grille. Refer to Section 501-02 .

3. ⚠ **WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, never remove the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).**

   Check the engine coolant level. Refer to Cooling System Draining, Filling and Bleeding in this section.

4. Connect the Radiator/Heater Core Pressure Tester to the degas bottle nipple and overflow hose. Install a pressure test pump to the quick-connect fitting of the test adapter.

5. **NOTE:** If the plunger of the pump is depressed too fast, an erroneous pressure reading will result.

Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained.

6. If the pressure relief cap does not hold pressure, remove and wash the pressure relief cap in clean water to dislodge all foreign particles from the gaskets. Check the sealing surface in the filler neck.

7. If 8-9 kPa (13 psi) cannot be reached, carry out the pressure relief cap component test. If more than 12 kPa (18 psi) shows on the gauge, install a new pressure relief cap.

8. ⚠ **CAUTION: If the pressure drops, check for leaks at the engine to heater core hoses, engine-to-radiator hoses, coolant valve hose (if applicable), oil cooler return tube gasket, radiator and heater core or other system components and connections. Any leaks which are found must be corrected and the system rechecked.**

   Pressurize the engine cooling system as described in Step 4 (using a pressure relief cap that operates within the specified upper and lower pressure limits). Observe the gauge reading for approximately 2 minutes; refer to General Specifications. Pressure should not drop during this time.

9. Release the system pressure by loosening the pressure relief cap. Check the engine coolant level and replenish, if necessary, with the correct engine coolant mixture. Refer to Cooling System Draining, Filling and Bleeding in this section.

Cap

⚠ **WARNING: Never remove the pressure relief cap under any conditions while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine and/or personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, remove the pressure relief cap (still with a cloth).**

1. Remove the pressure relief cap from the degas bottle.

2. Immerse the pressure relief cap in water and install it on the shallow filler neck of the Radiator/Heater Core Pressure Tester and the Radiator Cap Adapter, part of the Radiator/Heater Core Pressure Tester.

3. Immerse the filler neck seal in water and install it in the filler neck adapter.

4. Install the filler neck adapter with the filler neck seal to the Radiator Cap Adapter.

5. Connect the female quick-connect fitting of the pressure test pump to the male quick-connect fitting of the filler neck adapter.

6. **NOTE:** If the plunger of the pump is depressed too fast, an erroneous pressure reading will result.

   Slowly depress the plunger of the pressure test pump until the pressure gauge reading stops increasing and note the highest pressure reading obtained.

7. Release the pressure by turning the relief screw counterclockwise. Then tighten the pressure relief screw and repeat Step 6 (at least twice) to make sure the reading is repeatable within the specifications of the pressure relief cap.

8. If the pressure test gauge readings are not within specifications, install a new pressure relief cap. If the pressure test gauge readings are within specifications, carry out the cooling system Pressure Test.

Thermostat

A new thermostat should be installed only after the following electrical and mechanical tests have been carried out.

Thermostat Electrical Test

NOTE: The electrical thermostat test is most accurate if carried out indoors at less than 37.8°C (100°F) ambient air. This test can be carried out with or without the hood open and with the engine warm or cold.

1. Check the engine coolant level. Fill as needed.

2. With the ignition OFF, attach the Rotunda 73 Digital Multimeter to the cylinder head temperature (CHT) sensor. It may be used to monitor sensor voltage values between 0-5 volts.

3. **NOTE:** Running this test with the vehicle in gear or with the A/C compressor clutch engaged (running) will cause incorrect diagnosis.

   Place the transmission in PARK (P) or NEUTRAL (N).

4. Start the engine and allow the engine to idle throughout this test. Allow the engine to run for 2 minutes, then record the CHT voltage. Record the CHT voltage every 60 seconds. When the CHT voltage trend changes direction or only changes slightly (0.03 volt or less) from the previous reading, record this as the thermostat opening voltage. Use the voltage and corresponding coolant temperature chart listed below.

Coolant Temp °C (°F)	CHT Min (Volts)	CHT Nom (Volts)	CHT Max (Volts)
0 (32)	4.7714	4.8032	4.8723
25 (77)	4.3428	4.4148	4.4727
50 (122)	3.5354	3.6495	3.7473
80 (176)	2.3049	2.4201	2.5260
110 (230)	1.3021	1.3808	1.4562
140 (284)	0.6960	0.7414	0.7857
170 (338)	0.3784	0.4024	0.4261

5. If the thermostat opening temperatures are not between 89°C (192°F) and 104°C (219°F) or the corresponding voltages shown on the chart, install a new thermostat.

6. If the thermostat opening temperatures and voltages are within the specified range, the thermostat is good and a new thermostat is not required. GO to the Sympton Chart.

Thermostat Mechanical Test

1. Remove the thermostat housing.

2. Immerse the thermostat housing and thermostat in a boiling antifreeze and water mixture.

3. See the General Specifications chart for thermostat opening temperatures.

Radiator Leak Test, Removed From the Vehicle

⚠ CAUTION: Never leak test an aluminum radiator in the same water that copper/brass radiators are tested in. Flux and caustic cleaners can be present in the cleaning tank and they will damage aluminum radiators.

NOTE: Always install plugs in the oil cooler fittings before leak testing or cleaning any radiator.

NOTE: Clean the radiator before leak testing to avoid contamination of tank.

1. Leak test the radiator in clean water with 138 kPa (20 psi) air pressure.

Cooling Fan Motor and Shroud

1. Inspect the fan blade and shroud for any foreign materials. Clear the obstruction and continue the test procedure.

2. Rotate the fan to see if any contact between the shroud and blade exists. If contact is observed, install a new fan shroud assembly.

3. Rotate the fan by hand. The fan should rotate freely (no resistance should be felt, the fan will free-wheel with minimum effort). If any resistance is present, install a new fan assembly.

Cooling System Draining, Filling and Bleeding

Printable View (192 KB)

Special Tool(s)

ST2618-A	RADKITPLUS 078-00497

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon, VC-7 B, in Canada, VC-7-C) or equivalent	WSS-M97B51-A1

Draining

⚠ WARNING: Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are sure all the pressure has been released, (still with a cloth) turn and remove the pressure relief cap.

⚠ CAUTION: The coolant must be recovered in a suitable, clean container for reuse. If the coolant is contaminated it must be recycled or disposed of correctly.

⚠ CAUTION: Care must be taken to make sure the accessory drive belt does not become contaminated with engine coolant.

⚠ CAUTION: Vehicle cooling systems are filled with Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada, VC-7-C) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Always fill the cooling system with the same coolant that is present in the system. Do not mix coolant types.

1. Wrap a thick cloth around the coolant pressure relief cap on the degas bottle. Slowly turn the cap counterclockwise (left) until the pressure begins to release. When the pressure is released, remove the pressure relief cap.

2. **NOTE:** Less than 80% of coolant can be recovered with the engine in the vehicle. Dirty, rusty or contaminated coolant requires replacement.

   Place a suitable container below the radiator draincock. If equipped, disconnect the coolant return hose at the oil cooler.

- Close the radiator draincock when finished.

Filling and Bleeding With RADKITPLUS

1. Using the special tool, install the RADKITPLUS and follow the RADKITPLUS manufacturer's instructions to fill and bleed the cooling system.

Filling and Bleeding Without RADKITPLUS

⚠ WARNING: Do not open the cooling system while it is hot or the engine is running. Failure to follow these instructions can result in personal injury.

⚠ CAUTION: Engine coolant provides freeze protection, boil protection, cooling efficiency and corrosion protection to the engine and cooling components. In order to obtain these protections, the engine coolant must be maintained at the correct concentration and fluid level in the degas bottle.

When adding engine coolant, use a 50/50 mixture of engine coolant and clean, drinkable water.

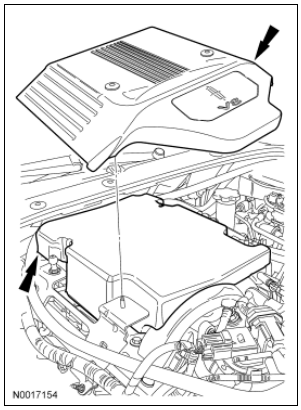
To maintain the integrity of the coolant and the cooling system:

- Add Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon VC-7-B, in Canada, VC-7-C) or equivalent meeting Ford specification WSS-M97B51-A1 (yellow color). Use the same coolant that was drained from the cooling system. Do not mix coolant types.
- Do not add Motorcraft Speciality Orange Engine Coolant VC-2 meeting Ford specification WSS-M97B44-D (orange color). Mixing coolants can degrade the coolant's corrosion protection.
- Do not add alcohol, methanol, brine or any engine coolants mixed with alcohol or methanol antifreeze. These can cause engine damage from overheating or freezing.
- Ford Motor Company does NOT recommend the use of recycled engine coolant in vehicles originally equipped with Motorcraft Premium Gold Engine Coolant since a Ford-approved recycling process is not yet available.

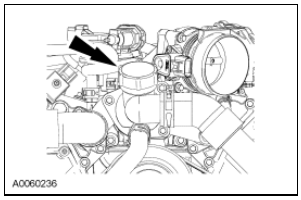
3.9L engines

1. **⚠ CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

   Remove the engine appearance cover and the noise suppressor (if detached).

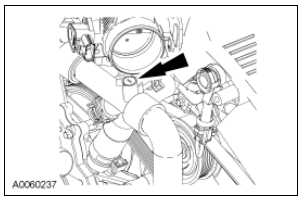


2. Remove the engine fill cap.



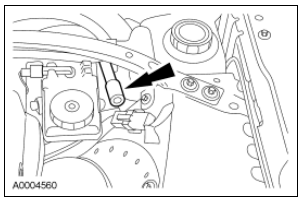
3.0L engines

3. Open the engine air bleed.



All engines

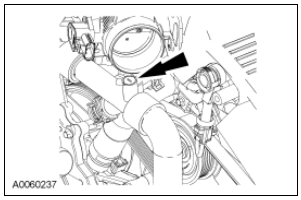
4. Open the heater air bleed.



5. Add coolant to the degas bottle allowing the system to equalize until no more coolant can be added.

3.0L engines

6. Close the engine air bleed when coolant begins to escape.



All engines

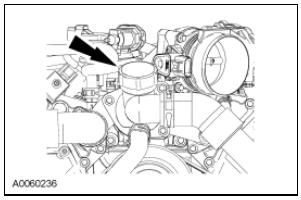
7. Install the degas bottle cap.

3.9L engines

⚠ CAUTION: Care must be taken to make sure the accessory drive belt does not become contaminated with engine coolant.

8. Add as much coolant as possible to the engine fill. The heater air bleed will remain open.

9. Install the engine fill cap.
   - Install the engine fill cap until contact is made, then tighten an additional 45 degrees (1/8 turn).

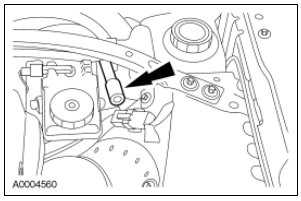


All engines

10. **NOTE:** The heater air bleed remains open.

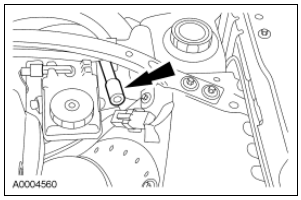
    Start the engine and turn the heater to the MAX position.

11. Close the heater air bleed when a steady stream of coolant escapes during engine idle.



12. Allow the engine to idle for 5 minutes. Add coolant to the degas bottle as needed to maintain the coolant level at the cold fill MAX mark.

13. Open the heater air bleed to release any trapped air and close again.



3.9L engines

14. Maintain engine speed of 2,000 rpm for 3-5 minutes or until hot air comes from the heater.

15. Return to idle and verify hot air is still coming from the heater.

3.0L engines

16. Maintain engine speed of 1,500 rpm for 3-5 minutes or until hot air comes from the heater.

17. Return to idle and verify hot air is still coming from the heater.

All engines

18. Set the heater temperature setting to 24°C (75°F) and allow the vehicle to idle for 2 minutes.

19. Shut the engine off and allow to cool.

20. After the engine has cooled, add coolant to the degas bottle to bring the level to the cold fill MAX mark.

3.9L engines

21. ⚠ **CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

    Install the noise suppressor (if detached) and the engine appearance cover.

Motorcraft Premium Cooling System Flush VC-1	ESR-M14P7-A

1. ⚠ **WARNING: Never remove the pressure relief cap while the engine is operating or when the cooling system is hot. Failure to follow these instructions can result in damage to the cooling system or engine or personal injury. To avoid having scalding hot coolant or steam blow out of the degas bottle when removing the pressure relief cap, wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly. Step back while the pressure is released from the cooling system. When you are sure all the pressure has been released, (still with a cloth) turn and remove the pressure relief cap.**

   Once pressure is released, remove the pressure relief cap.

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Remove the thermostat. For additional information, refer to Thermostat and Thermostat Housing - Exploded View, 3.0L (4V) and Thermostat - 3.0L (4V) or Thermostat - 3.9L in this section.

4. Install the hose connection without the thermostat.

5. **NOTE:** Refer to the cooling system Pro Flush and Fill operating instructions for specific vehicle hook-up.

   Use cooling system Pro Flush and Fill, Coolant Flush Kit and Drain Kit to flush the engine and radiator.

6. Install the thermostat. For additional information, refer to Thermostat and Thermostat Housing - Exploded View, 3.0L (4V) and Thermostat - 3.0L (4V) or Thermostat - 3.9L in this section.

7. Backflush the heater core. For additional information, refer to Heater Core Backflushing in this section.

8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat 3.0L (4V) Printable View (8 KB)

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

3. Remove the 2 thermostat housing retaining bolts and separate the upper and lower thermostat housing.
   - To install, tighten to 11 Nm (8 lb-ft).

4. Remove the thermostat and the thermostat O-ring.
   - Inspect the thermostat O-ring and install a new O-ring if necessary.

5. To install, reverse the removal procedure.

6. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat Housing 3.0L (4V) Printable View (8 KB)

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Disconnect the upper radiator hose from the thermostat housing and position aside.
4. Disconnect the coolant pump-to-thermostat housing hose and position aside.
5. Disconnect the lower radiator hose from the thermostat housing and remove the thermostat housing.
6. To install, reverse the removal procedure.
7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2		Thermostat spring (part of 8575)
3		Thermostat main spring (part of 8575)
4		Thermostat element (part of 8575)

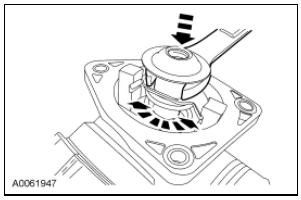
Removal

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the thermostat housing. For additional information, refer to Thermostat Housing 3.9L in this section.

3. **NOTE:** Thermostat can be rotated in either direction to release it from the thermostat housing.

   Using a 18 mm (0.7 in) open end wrench, simultaneously push down and turn the thermostat retainer to release it from the housing.



4. Remove the thermostat spring, thermostat main spring and the thermostat element.

Installation

1. **⚠ CAUTION: When installing the thermostat into the thermostat housing, make sure to align the thermostat pin with the hole in the housing.**

   Position the thermostat into the thermostat housing.

   - Be sure to install the small end of the thermostat spring toward the thermostat housing.

2. ⚠ **CAUTION: After installing the thermostat into the thermostat housing, make sure that the tabs on the thermostat retainer are locked into the tabs on the thermostat housing.**

   NOTE: The thermostat can be rotated in either direction to install it in the thermostat housing.

   Using an 18 mm (0.7 in) open end wrench, simultaneously push down and turn the thermostat retainer to install the thermostat in the housing.

3. Install the thermostat housing. For additional information, refer to Thermostat Housing 3.9L in this section.

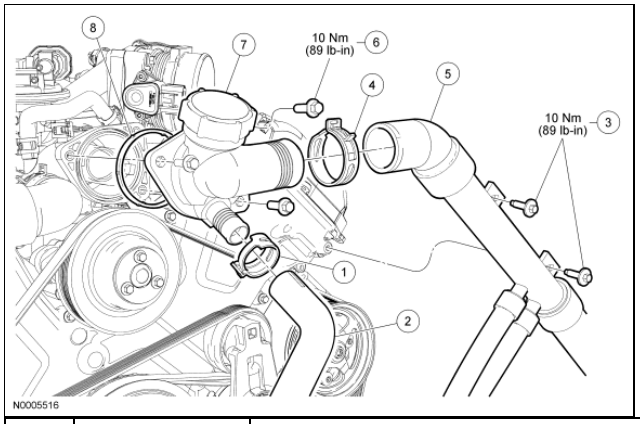
4. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Thermostat Housing 3.9L

Printable View (161 KB)

Material

Item	Specification
Motorcraft Premium Gold Engine Coolant VC-7-A (in California and Oregon, VC-7-B, in Canada, VC-7-C) or equivalent	WSS-M97B51-A1



Item	Part Number	Description
1	15161	Auxiliary coolant pump-to-thermostat housing hose clamp
2	18K580	Auxiliary coolant pump-to-thermostat housing hose
3	W503925	Lower radiator hose support bracket bolts (2 required)
4	15161	Lower radiator-to-thermostat housing hose clamp
5	8B273	Lower radiator-to-thermostat housing hose
6	W500014	Thermostat housing bolts (3 required)
7	8594	Thermostat housing
8	8A571	Thermostat housing O-ring seal

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

3. Disconnect the auxiliary coolant pump-to-thermostat housing hose and position aside.

4. Remove the 2 lower radiator hose support bracket bolts.
   - To install, tighten to 10 Nm (89 lb-in).

5. Disconnect the lower radiator-to-thermostat housing hose and position aside.

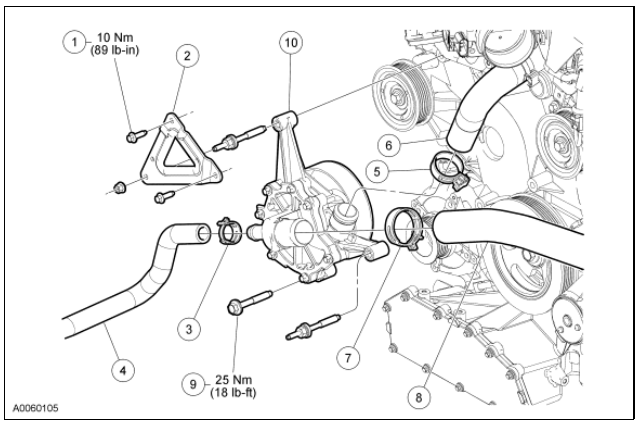
6. Remove the 3 bolts and the thermostat housing.
    - Discard the thermostat housing O-ring seal.
    - To install, tighten to 10 Nm (89 lb-in).

7. To install, reverse the removal procedure.
    - Install a new thermostat housing O-ring seal and lubricate with clean engine coolant.

8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump 3.0L (4V)

Printable View (124 KB)



Item	Part Number	Description
1	701542	Intake manifold support bracket bolt (3 required)
2	9J444	Intake manifold support bracket
3	8287	Coolant pump-to-radiator hose clamp
4	18K579	Coolant pump-to-radiator hose
5	15161	Coolant pump-to-coolant inlet pipe hose clamp
6	8A520	Coolant pump-to-coolant inlet pipe hose
7	15161	Coolant pump-to-thermostat housing hose clamp
8	9894569-3	Coolant pump-to-thermostat housing hose
9	704919	Coolant pump bolts (3 required)
10	8501	Coolant pump

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the cooling fan motor and shroud. For additional information, refer to Cooling System Components - Exploded View, Radiator, Cooling Fan Motor and Shroud and Cooling Fan Motor and Shroud in this section.

3. Remove the accessory drive belt. For additional information, refer to Section 303-05 .

4. Remove the 3 bolts and the intake manifold support bracket.
   - To install, tighten to 10 Nm (89 lb-in).

5. Disconnect the coolant pump-to-radiator hose and position aside.

6. Disconnect the coolant pump-to-coolant inlet pipe hose and position aside.

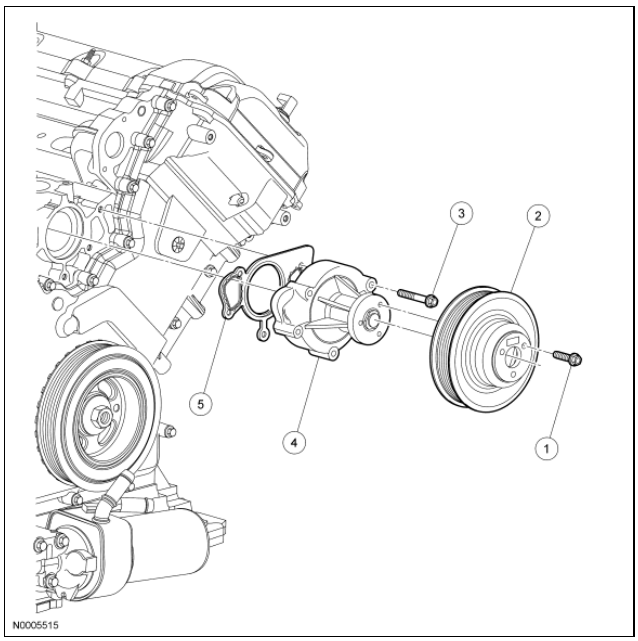
7. Disconnect the coolant pump-to-thermostat housing hose and position aside.

8. Remove the 3 bolts and the coolant pump.
   - To install, tighten to 25 Nm (18 lb-ft).

9. To install, reverse the removal procedure.
10. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Pump 3.9L

Printable View (148 KB)



Item	Part Number	Description
1	W705629	Coolant pump pulley bolts (3 required)
2	8509	Coolant pump pulley
3	W500304	Coolant pump bolt (5 required)
4	8501	Coolant pump
5	8507	Coolant pump gasket

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the thermostat housing. For additional information, refer to Thermostat Housing 3.9L in this section.

3. Loosen the coolant pump pulley bolts.
   - Do not remove at this time.

4. Remove the accessory drive belt. For additional information, refer to Section 303-12 .

5. Remove the 3 bolts and the coolant pump pulley.
   - To install, tighten to 10 Nm (89 lb-in), then rotate an additional 45 degrees.

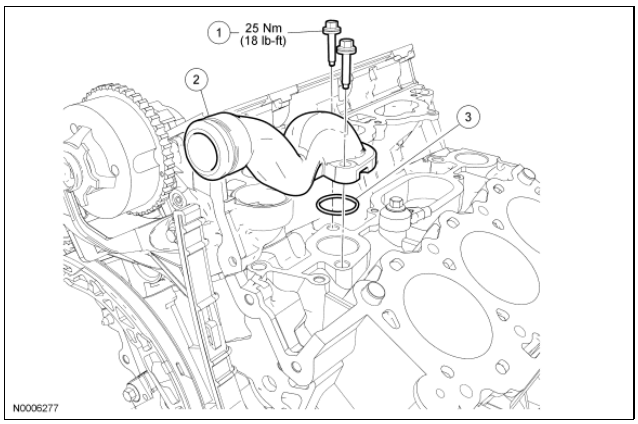
6. Remove the 5 bolts and the coolant pump.
   - Remove and discard the coolant pump gasket.
   - To install, tighten to 8 Nm (71 lb-in), then rotate an additional 90 degrees.

7. To install, reverse the removal procedure.
   - Install a new coolant pump gasket.

8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Inlet Pipe 3.0L (4V)

Printable View (134 KB)



Item	Part Number	Description
1	701663	Coolant inlet pipe bolts (2 required)
2	8A560	Coolant inlet pipe
3		Coolant inlet pipe O-ring seal

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the LH cylinder head. For additional information, refer to Section 303-01A .

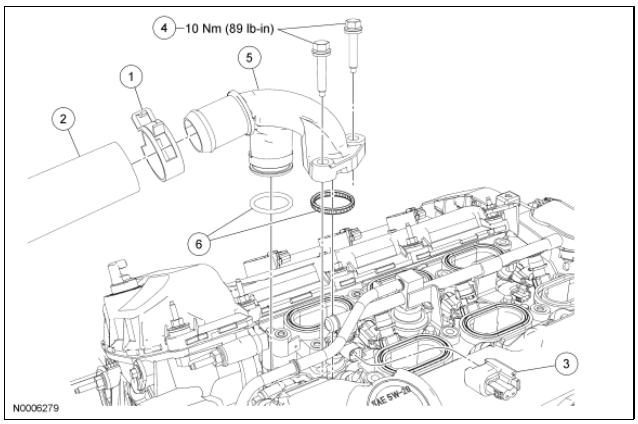
3. Remove the 2 bolts and the coolant inlet pipe.
   - Inspect the coolant inlet pipe O-ring and install a new O-ring if necessary.
   - To install, tighten to 25 Nm (18 lb-ft).

4. To install, reverse the removal procedure.

5. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Outlet Pipe 3.0L (4V)

Printable View (133 KB)



Item	Part Number	Description
1	15161	Upper coolant bypass hose clamp
2	8548	Upper coolant bypass hose
3	14A464	Fuel injector electrical connector
4	701669	Coolant outlet pipe bolt (2 required)
5	8548	Coolant outlet pipe
6		Coolant outlet pipe O-ring seal (2 required)

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

3. Disconnect the upper coolant bypass hose from the coolant outlet pipe and position aside.

4. Disconnect the fuel injector electrical connector from the front fuel injector.

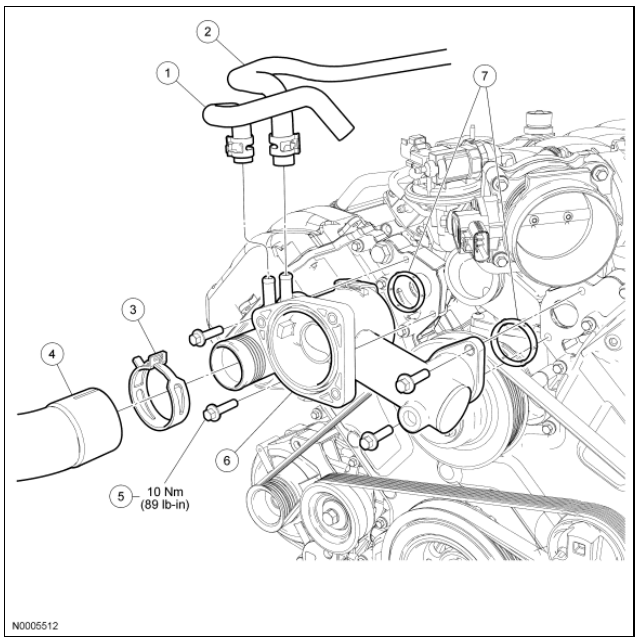
5. Remove the 2 bolts and the coolant outlet pipe.
   - Inspect the 2 coolant outlet pipe O-ring seals and install new seals if necessary.
   - To install, tighten to 10 Nm (89 lb-in).

6. To install, reverse the removal procedure.

7. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Coolant Outlet Pipe 3.9L

Printable View (209 KB)



Item	Part Number	Description
1	9F813	Throttle body heater hose
2	8276	Degas bottle hose
3	15161	Upper radiator hose clamp
4	3W43	Upper radiator hose
5	W500015	Coolant outlet pipe bolts (4 required)
6	8A504	Coolant outlet pipe
7	W707299	Coolant outlet pipe seals (2 required)

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the thermostat housing. For additional information, refer to Thermostat Housing 3.9L in this section.

3. Disconnect the throttle body heater hose from the coolant outlet pipe and position aside.

4. Disconnect the degas bottle hose from the coolant outlet pipe and position aside.

5. Disconnect the upper radiator hose from the coolant outlet pipe and position aside.

6. Remove the 4 bolts and the coolant outlet pipe.
   - Inspect the 2 coolant outlet pipe seals and install new seals if necessary.
   - To install, tighten to 10 Nm (89 lb-in).

7. To install, reverse the removal procedure.

8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Cooling System Components Exploded View, Radiator, Cooling Fan Motor and Shroud

1. For additional information, refer to the procedures in this section.

Radiator

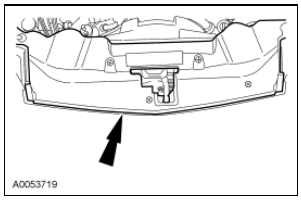
Printable View (70 KB)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

3. Remove the cooling fan motor and shroud. For additional information, refer to Cooling Fan Motor and Shroud in this section.

4. Remove the upper radiator sight shield.



5. Disconnect the upper radiator hose from the radiator and position aside.

6. Disconnect the lower radiator hose from the radiator and position aside.

7. Remove the 6 bolts and the 2 upper radiator support brackets.
   - To install, tighten to 10 Nm (89 lb-in).

8. **NOTE:** Lower the A/C condenser to gain access to the A/C condenser-to-radiator bolts.

   Remove the 2 A/C condenser retaining bolts and position the A/C condenser aside.

   - To install, tighten to 10 Nm (89 lb-in).

9. Remove the 2 A/C condenser upper bracket bolts and the 2 upper brackets.
   - To install, tighten to 10 Nm (89 lb-in).

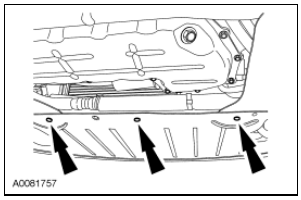
10. **NOTE:** It may be necessary to lean the radiator forward to gain access to the combination cooler bolts.

    NOTE: Lift the combination cooler up and forward to release it from the radiator retaining clips.

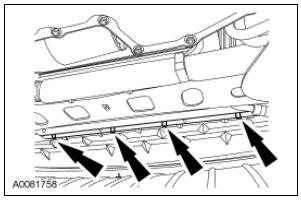
    Remove the 2 bolts and position the combination cooler aside.

    - To install, tighten to 10 Nm (89 lb-in).

11. Remove the 3 bolts and position the shield down.



12. Release the clips and position the radiator shield down and remove the radiator.



13. To install, reverse the removal procedure.
    - Make sure that the combination cooler is seated in the radiator retaining clips.

14. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Cooling Fan Motor and Shroud

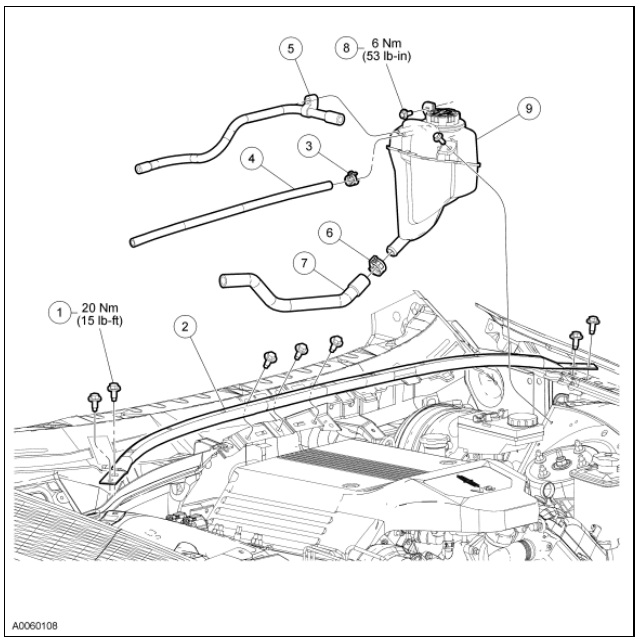
Printable View (8 KB)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .
3. Disconnect the 2 cooling fan motor and shroud electrical connectors.
4. Disconnect the coolant control valve jumper harness electrical connector.
5. Remove the bolt and the receiver/drier and bracket and position it aside.
   - To install, tighten to 11 Nm (8 lb-ft).
6. Disconnect the coolant control valve electrical connector.
7. Remove the bolt and the coolant control valve and position it aside.
   - To install, tighten to 6 Nm (53 lb-in).
8. If equipped, remove the 2 bolts and the auxiliary coolant pump.
   - To install, tighten to 9 Nm (79 lb-ft).
9. Remove the 2 bolts and the cooling fan motor and shroud.
   - To install, tighten to 10 Nm (89 lb-in).
10. To install, reverse the removal procedure.

Degas Bottle

Printable View (151 KB)



Item	Part Number	Description

2	3B328	Cross vehicle support
3	15161	Engine vent hose clamp
4	8276	Engine vent hose
5	8C289	Air bleed hose
6	15161	Degas bottle return hose clamp
7		Degas bottle return hose
8	W705968	Degas bottle bolts (2 required)
9	8A080	Degas bottle

Removal and Installation

1. Drain the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

2. Remove the cowl panel grille. For additional information, refer to Section 501-02 .

3. Remove the 7 bolts and the cross vehicle support.
   - To install, tighten to 20 Nm (15 lb-ft).

4. Disconnect the engine vent hose and air bleed hose from the degas bottle and position aside.

5. Disconnect the degas bottle return hose from the degas bottle and position aside.

6. Remove the 2 bolts and the degas bottle.
   - To install, tighten to 6 Nm (53 lb-in).

7. To install, reverse the removal procedure.

8. Fill and bleed the cooling system. For additional information, refer to Cooling System Draining, Filling and Bleeding in this section.

Fuel Charging and Controls

Printable View (58 KB)

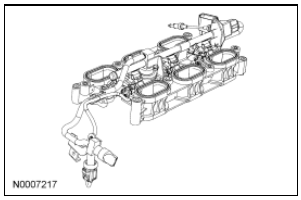
The fuel charging and controls system consists of the:

- electronic throttle body.
- fuel injectors.
- fuel charging wiring.
- fuel supply manifold.
- fuel pressure and temperature sensor

The fuel charging and controls system is:

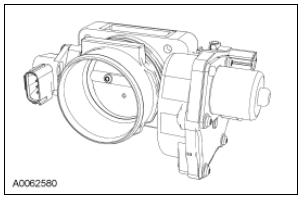
- a sequential multiport fuel injection (SFI) system.
- pulse-width modulated.
- mass airflow-controlled.

The powertrain control module (PCM) controls the fuel injection system. Injector pulse-width is varied to control the amount of fuel flow. Varying fuel pump output controls fuel pressure. The PCM commands the fuel pump driver module, which directly controls the fuel pump. The throttle body is electronically controlled by the engine management system (EMS). Throttle plate angle is changed electronically in response to throttle pedal movements initiated by the driver.



The fuel supply manifold:

- delivers fuel to the individual fuel injectors.
- receives fuel from the fuel supply tube.
- is serviced as a lower intake manifold assembly only. For additional information, refer to Section 303-01A .



The electronic throttle body:

- controls air supply to the upper intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- must not be cleaned.

The fuel injectors:

- are electronically controlled by the powertrain control module (PCM).

- atomize the fuel as the fuel is delivered.
- are deposit resistant.
- have an internal solenoid that opens a needle valve to inject fuel into the lower intake manifold.

The fuel pressure sensor:

- maintains constant fuel pressure to the fuel injectors and throughout the fuel system.
- is spring-loaded and operated by intake manifold vacuum.

Fuel Charging and Controls

Printable View (7 KB)

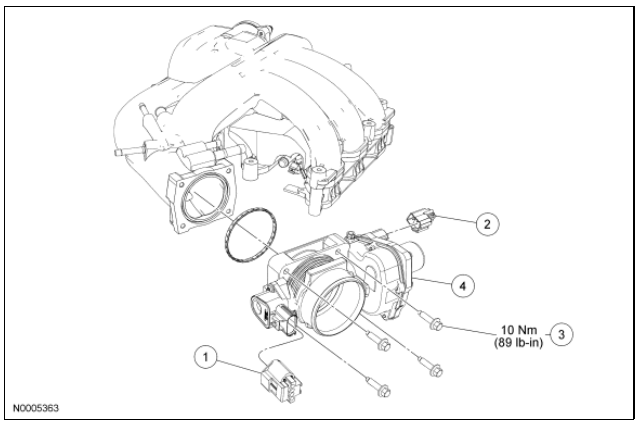
Throttle Body

Printable View (82 KB)



Item	Part Number	Description
1		Throttle position (TP) sensor electrical connector (part of 14A464)
2		Electronic throttle body motor electrical connector (part of 14A464)
3	W701242	Electronic throttle body bolts
4	9F991	Electronic throttle body

Removal and Installation

⚠ CAUTION: Throttle body bore and plate area have a special coating and cannot be cleaned, or possible damage to the throttle body can occur.

1. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

2. Disconnect the throttle position sensor electrical connector.

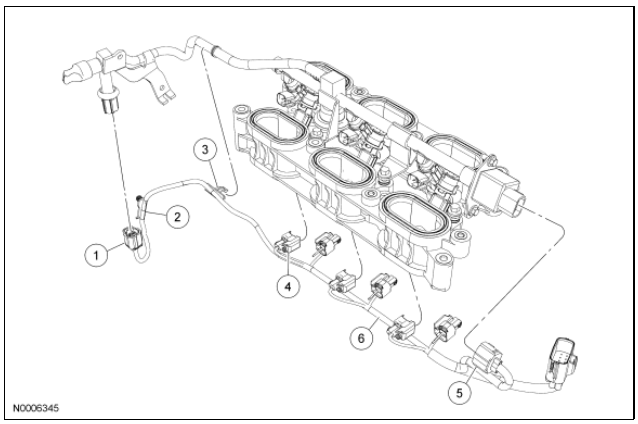
3. Disconnect the electronic throttle body motor electrical connector.

4. Remove the 4 bolts and the electronic throttle body.
   - Remove and discard the gasket.
   - To install, tighten to 10 Nm (89 lb-in).

5. To install, reverse the removal procedure.
   - Install a new intake manifold-to-electronic throttle body gasket.

Fuel Charging Wiring Harness

Printable View (105 KB)



Item	Part Number	Description
1	14A464	Fuel temperature sensor electrical connector
2	14A163	Fuel charging wiring harness retaining pin

4	98AG	Fuel injector electrical connector (6 required)
5	14A464	Fuel pressure sensor electrical connector
6	9D930	Fuel charging wiring harness

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components the fuel system pressure must be relieved. Failure to do so can result in personal injury.

1. Disconnect the battery ground cable. For additional information, refer to Section 100-02 .
2. Remove the lower intake manifold. For additional information, refer to Section 303-01A .
3. Disconnect the fuel temperature and pressure sensor electrical connector.
4. Disconnect the fuel charging wiring harness retaining pin and clip from the lower intake manifold assembly.
5. Disconnect the 6 fuel injector electrical connectors.
6. Disconnect the fuel pressure and temperature sensor electrical connector and remove the fuel charging wiring harness.
7. To install, reverse the removal procedure.

Fuel Charging and Controls

Printable View (61 KB)

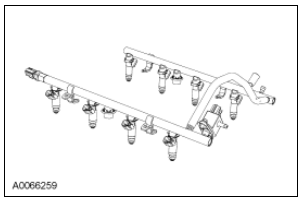
The fuel charging and controls system consists of the following:

- Electronic throttle body
- Fuel injectors
- Fuel charging wiring harness
- Fuel rail

The fuel charging and controls system is:

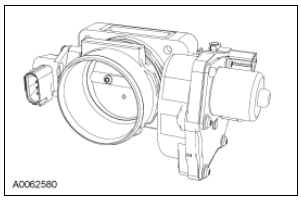
- a sequential multiport fuel injection (SFI) system.
- pulse-width modulated.
- mass airflow controlled.

The powertrain control module (PCM) controls the fuel injection system. Injector pulse-width is varied to control the amount of fuel flow. Varying fuel pump output controls fuel pressure. The PCM commands the fuel pump driver module, which directly controls the fuel pump. The throttle body is electronically controlled by the engine management system (EMS). Throttle plate angle is changed electronically in response to throttle pedal movements initiated by the driver.



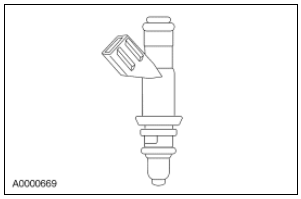
The fuel rail:

- delivers fuel to the individual fuel injectors.
- receives fuel from the fuel supply tube.



The electronic throttle body:

- controls air supply to the intake manifold by electronically positioning the throttle plate.
- is not adjustable.
- must not be cleaned.



The fuel injectors:

- are electronically operated by the powertrain control module (PCM).
- atomize the fuel as the fuel is delivered.
- each have an internal solenoid which opens a needle valve to inject fuel into the lower intake manifold.
- are deposit-resistant.

The fuel pressure sensor:

- maintains constant fuel pressure to the fuel injectors and throughout the fuel system.
- is spring-loaded and operated by intake manifold vacuum.

The engine wiring harness:

- connects the fuel injectors and other electronic engine controls, such as the throttle position (TP) sensor, to the PCM.
- receives fuel injector signals from the PCM and transfers the signals to the fuel injectors.

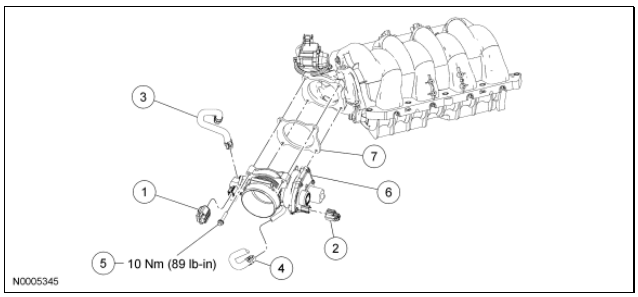
Fuel Charging and Controls

Printable View (7 KB)

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Throttle Body

Printable View (134 KB)



Item	Part Number	Description
1		Throttle position (TP) sensor electrical connector (part of 14A464)
2		Electronic throttle body motor electrical connector (part of 14A464)
3	9F813	Throttle body heater inlet hose and clamp assembly
4	9F914	Throttle body heater outlet hose and clamp assembly
5	W503280	Throttle body bolt (4 required)
6	9F991	Electronic throttle body
7	9F809	Electronic throttle body gasket

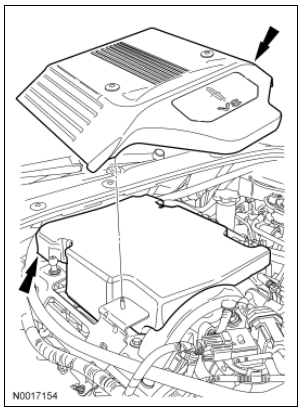
Removal and Installation

⚠ CAUTION: Throttle body bore and plate area have a special coating and cannot be cleaned, or possible damage to the throttle body can occur.

NOTE: Only a small amount of coolant may be lost when disconnecting the throttle body heater inlet and outlet hose.

1. **⚠ CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

   Remove the engine appearance cover and the noise suppressor (if detached).



2. Remove the air cleaner outlet pipe. For additional information, refer to Section 303-12 .

3. Disconnect the throttle position (TP) sensor electrical connector from the TP sensor.

4. Disconnect the electronic throttle body motor electrical connector from the electronic throttle body.

5. Disconnect the throttle body heater inlet hose and clamp assembly from the electronic throttle body and position it aside.

6. Disconnect the throttle body heater outlet hose and clamp assembly from the electronic throttle body and position it aside.

7. Remove the 4 bolts and the electronic throttle body.
    - Remove and discard the intake manifold-to-electronic throttle body gasket.
    - To install, tighten to 10 Nm (89 lb-in).

8. To install, reverse the removal procedure.
    - Install a new intake manifold-to-electronic throttle body gasket.

Material

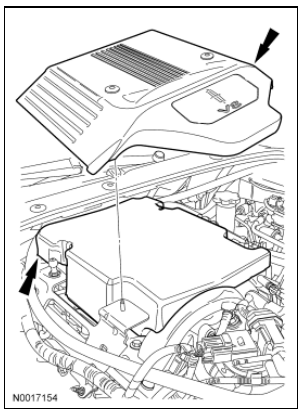
Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP (in Canada Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12) or equivalent	WSS-M2C930-A

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved. Failure to do so can result in personal injury.

1. Release the fuel system pressure. For additional information, refer to Section 310-00 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. **⚠ CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

   Remove the engine appearance cover and the noise suppressor (if detached).



4. Remove the 4 engine appearance cover mounting bracket nuts and the brackets.
   - To install, tighten to 6 Nm (53 lb-in).
5. Disconnect the fuel pressure sensor electrical connector from the fuel pressure sensor.
6. Disconnect the fuel pressure sensor vacuum connector from the fuel pressure sensor.

7. Disconnect the 8 fuel injector electrical connectors from the fuel injectors.

8. Disconnect the fuel temperature sensor electrical connector from the fuel temperature sensor.

9. Disconnect the fuel supply tube spring lock coupling. For additional information, refer to Section 310-00 .

10. Remove the 4 bolts and the fuel rail and fuel injectors as an assembly.
    - To install, tighten to 9 Nm (80 lb-in).

11. Remove the 8 fuel injectors from the fuel rail.

12. ⚠ **CAUTION: Use O-ring seals that are made of special fuel-resistant material. The use of ordinary O-ring seals can cause the fuel system to leak. Do not reuse the O-ring seals.**

    Remove and discard the 16 O-ring seals from the fuel injectors.

13. To install, reverse the removal procedure.
    - Lubricate the new fuel injector O-ring seals with clean engine oil before installing.
    - Align the fuel tube fittings and press together until an audible click is heard. Then, pull on the fittings to make sure they are fully engaged.

Inspection and Verification

⚠ CAUTION: Under no circumstances should the accessory drive belt, tensioner or pulleys be lubricated as potential damage to the belt material and tensioner damping mechanism will occur. Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

1. Verify the customer concern by operating the system.

2. Visually inspect for obvious signs of mechanical damage.

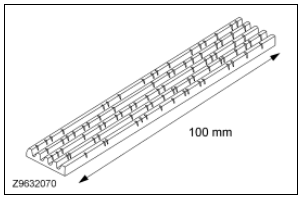
Visual Inspection Chart

Mechanical
• Drive belt cracking/chunking/wear • Belt/pulley contamination • Incorrectly routed belt • Pulley misalignment or excessive pulley runout • Loose or mislocated hardware • Incorrectly routed power steering tubes (rubbing)

3. Eliminate all other non-belt related noises that could cause belt misdiagnosis, such as A/C compressor engagement chirp, power steering cavitations at low temperatures, variable camshaft timing (VCT) tick or generator whine.

4. If a concern is found, correct the condition before proceeding to the next step.

V-Ribbed Serpentine Drive Belt With Cracks Across Ribs

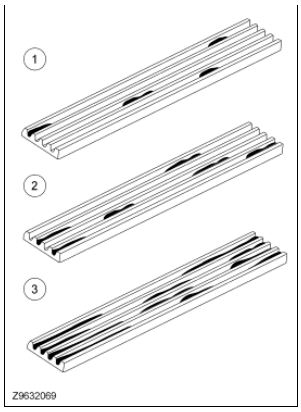


5. **NOTE:** Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If damage exceeds the acceptable limit or any chunks are found to be missing from the ribs, a new belt must be installed.

   Check the belt for cracks. Up to 15 cracks in a rib over a distance of 100 mm (4.0 in) can be considered acceptable. If cracks exceed this standard, install a new belt.

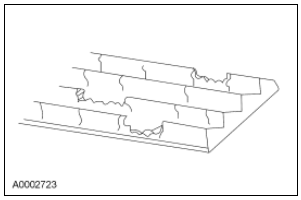
V- Ribbed Serpentine Belt With Piling

NOTE: Piling is an excessive buildup in the V-grooves of the belt.



6. The condition of the V-ribbed drive belt should be compared against the illustration and appropriate action taken.
    1. Small scattered deposits of rubber material. This is not a concern, therefore, installation of a new belt is not required.
    2. Longer deposit areas building up to 50 percent of the rib height. This is not considered a concern but it can result in excessive noise. If noise is apparent, install a new belt.
    3. Heavy deposits building up along the grooves resulting in a possible noise and belt stability concern. If heavy deposits are apparent, install a new belt.

V-Ribbed Serpentine Belt With Chunks of Rib Missing



7. There should be no chunks missing from the belt ribs. If the belt shows any evidence of this, install a new accessory drive belt.

8. If the concern is not visually evident, verify the symptom and GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Drive Belt Noise/Flutter

Drive belt chirp occurs due to pulley misalignment or excessive pulley runout. It can be the result of a damaged or an incorrectly aligned grooved pulley.

To correct, determine the area where the noise comes from. Check each of the pulleys in that area with a straightedge to the crankshaft pulley. Look for accessory pulleys out of position in the fore/aft direction or at

an angle to the straightedge.

⚠ CAUTION: Do not apply any fluids or belt dressing to the accessory drive belt or pulleys.

Drive belt squeal may be an intermittent or constant noise that occurs when the drive belt slips on an accessory pulley under certain conditions.

A short intermittent squeal may occur during engine start-up and shut down or during very rapid engine acceleration and decelerations, such as:

- wide open throttle 1-2 and 2-3 shifts or 2-3 and 3-4 back out shifts on automatic transmissions.
- wide open throttle 1-2 and 2-3 shifts and any combination of rapid downshifting on manual transmissions.

These special short-term transient events are expected, and are due to the higher system inertias required to meet the electrical and cooling demands on today's vehicle systems. Constant or re-occurring drive belt squeal can occur under these conditions:

- if the A/C discharge pressure goes above specifications:
  - ♦ the A/C system is overcharged.
  - ♦ the A/C condenser core airflow is blocked.
- if the A/C OFF equalized pressure (the common discharged and suction pressure that occurs after several minutes) exceeds specifications.
- if any of the accessories are damaged or have a worn or damaged bearing. All accessories should be rotatable by hand in the unloaded condition, if not, inspect the accessory.
- if there is evidence of fluid contamination on the accessory drive belt. When the drive belt has been exposed to fluid contamination during vehicle operation, such as leaks from the power steering system, A/C system or cooling system, clean all pulleys with soap and water, rinse with clean water and install a new accessory drive belt. If the drive belt has been exposed to fluids in a localized area during routine vehicle service, such as replacement of hoses or fluids, the drive belt and pulleys should be washed with soap and water immediately (prior to starting the engine), and rinsed with clean water.
- if the accessory drive belt is too long. A drive belt that is too long will allow the accessory drive belt tensioner arm to go all the way to the arm travel stop under certain load conditions, which will release tension to the drive belt. If the accessory drive belt tensioner indicator is outside the normal installation wear range window, install a new accessory drive belt.
- **NOTE:** The accessory drive belt tensioner arm should rotate freely without binding.

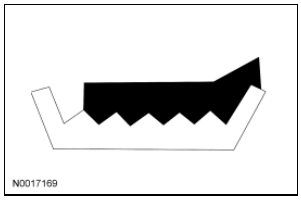
  Install a new accessory drive belt tensioner if the drive belt tensioner is worn or damaged.

Incorrect Drive Belt Installation

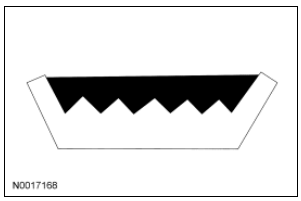
⚠ CAUTION: Incorrect accessory drive belt installation will cause excessive drive belt wear and can cause the drive belt to come off the pulleys.

Non-standard accessory drive belts can track differently or incorrectly. If an accessory drive belt tracks incorrectly, install a new accessory drive belt to avoid performance failure or loss of the drive belt.

Incorrect Installation



Correct Installation



With the engine running, check accessory drive belt tracking on all pulleys. If the edge of the accessory drive belt rides beyond the edge of the pulleys, noise and premature wear will occur. Make sure the accessory drive belt rides correctly on the pulley. If an accessory drive belt tracking condition exists, proceed with the following:

- Visually check the accessory drive belt tensioner for damage, especially the mounting pad surface. If the accessory drive belt tensioner is not installed correctly, the mounting surface pad will be out of position. This will result in chirp and squeal noises.
- With the engine running, visually observe the grooves in the pulleys (not the pulley flanges or the pulley forward faces) for excessive wobble. Install new components as necessary.
- Check all accessories, mounting brackets and the accessory drive belt tensioner for any interference that would prevent the component from mounting correctly. Correct any interference condition and recheck the accessory drive belt tracking.
- Tighten all accessories, mounting brackets and accessory drive belt tensioner retaining hardware to specification. Recheck the accessory drive belt tracking.

Belt Tensioner Mechanical

The only mechanical check that needs to be made is a check for tensioner stick, grab or bind.

1. With the engine OFF, check routing of the accessory drive belt. For additional information, refer to the illustrations under Description and Operation in this section.

2. **NOTE:** The accessory drive belt tensioner spring is very strong and requires substantial force to release.

   Using a suitable, commercially available serpentine belt tensioner release tool, release the tension on the belt and detach the accessory drive belt in the area of the tensioner.

3. Using the suitable, commercially available serpentine belt tensioner release tool, move the tensioner from its relaxed position, through its full stroke and back to the relaxed position to make sure there is no stick, grab or bind, and to make sure that there is tension on the tensioner spring.

4. Rotate the tensioner pulley by hand and check for a binding, contaminated or seized condition. Install a new accessory drive belt tensioner if necessary.

5. Inspect the area surrounding the accessory drive belt tensioner for oil leaks or contamination and repair any leaks. Install a new accessory drive belt tensioner as necessary.

6. If the accessory drive belt tensioner meets the above criteria, proceed to testing the tensioner dynamically. If the accessory drive belt tensioner does not meet the above criteria, install a new tensioner.

Belt Tensioner Dynamics

The accessory drive belt tensioner can be checked dynamically as follows:

1. With the engine running, observe the accessory drive belt tensioner movement. The accessory drive tensioner should move (respond) when the air conditioning clutch cycles (if equipped), or when the engine is accelerated rapidly. If the accessory drive belt tensioner movement is excessive without air conditioning clutch cycling or engine acceleration, check belt rideout. Excessive belt rideout (uneven depth of grooves in the belt) can cause excessive accessory drive belt tensioner movement. Check rideout condition by installing a new belt. If excessive accessory drive belt tensioner movement still exists, install a new accessory drive belt tensioner.

Starting System

Printable View (7 KB)

The starting system consists of the following components:

- Starter motor
- Ignition switch
- Digital transmission range (TR) sensor
- Starter relay
- Battery

The function of the starting system is to crank the engine at a speed fast enough to permit the engine to start.

Starting System

Printable View (251 KB)

Refer to Wiring Diagrams Cell 20 , Starting System for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Principles of Operation

Anti-Theft Intervention

The starting system is electronically controlled by the passive anti-theft system (PATS). The PATS recognizes the correct electronically coded ignition key and signals the instrument cluster to provide a ground for the starter relay. The energized relay provides voltage to the starter solenoid, thereby allowing the starter motor to activate.

Inspection and Verification

⚠ WARNING: When carrying out underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. A protective cap or boot is provided over the terminal of this lead and must be installed after the repair procedure is completed. Failure to follow these instructions may result in personal injury.

⚠ WARNING: When working in the area of the starter motor, be careful to avoid touching hot exhaust components. Failure to follow these instructions can result in personal injury.

NOTE: When working on the starter system, make sure the anti-theft system is deactivated.

1. Verify the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Starter motor • Brackets	• Battery • Auxiliary junction box (AJB) fuse 121 (30A) • Battery junction box (BJB) fuse 22 (20A)

	• Central junction box (CJB) fuse 201 (5A) • Starter relay • Loose or corroded connectors • Damaged wiring

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the concern remains after the inspection, determine the symptom(s). GO to Symptom Chart .

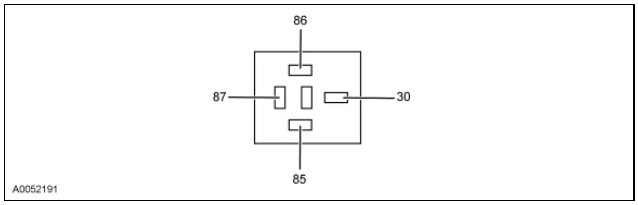
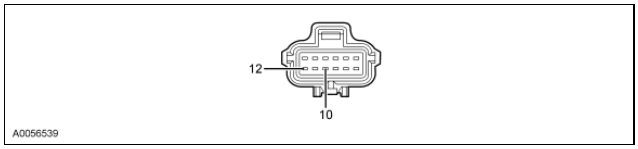
Starter Motor Relay



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
85	CKT 31S-BB12 (BK/YE) starter motor relay to instrument cluster	10,000 ohms or greater to chassis ground and 0 volts.
87	CKT 50-BB10 (GY/BK) starter motor relay to starter motor S-terminal	Greater than 10 volts with ignition in the START position.
86	CKT 50S-BB12 (GY) starter motor relay to transmission range (TR) sensor	Greater than 10 volts with ignition in START position.
30	CKT 30-BB13 (RD) starter motor relay to power distribution box (PDB).	Greater than 10 volts with ignition in START position.

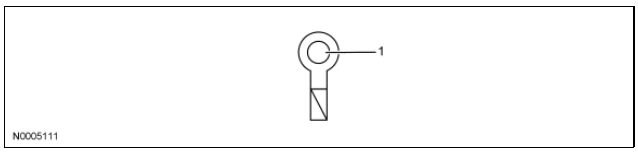
Transmission Range (TR) Sensor



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

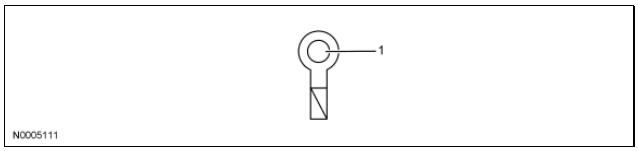
12	CKT 50S-BB12 (GY) TR sensor to starter relay pin 86	10 volts or greater in START position.
10	CKT 50-BB15 (GY/OG) TR sensor to CJB fuse 201 (5A)	10 volts or greater in START position.

Starter Motor S-Terminal C197a



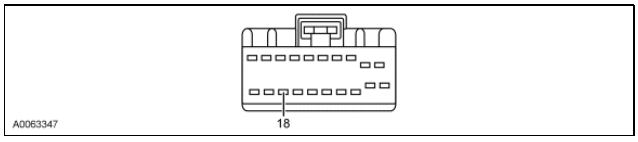
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 50-BB10 (GY/BK) starter motor relay to starter motor S-terminal	Greater than 10 volts with ignition in the START position.

Starter Motor B-Terminal C197c



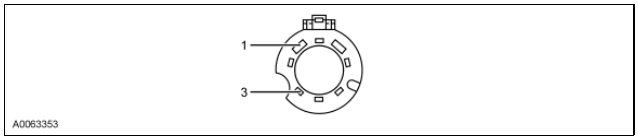
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 30-BB10 (RD) battery voltage to starter motor B-terminal	Greater than 10 volts with ignition in the START position.

Instrument Cluster



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
18	CKT 31S-BB12 (BK/YE) instrument cluster to starter motor relay	10,000 ohms or greater to chassis ground and 0 volts.

Ignition Switch



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 30-BB9 (RD) ignition switch to PDB fuse 22 (20A)	10 volts or greater at all times.
3	CKT 50-DD5 (GY/BK) ignition switch to CJB fuse 201 (5A)	10 volts or greater in START position.

Pinpoint Tests

Pinpoint Test A: The Engine Does Not Crank

Normal Operation

Under normal operation the power distribution box (PDB) supplies constant power to the starter relay on circuit 30-BB13 (RD) through fuse 121 (30A). When the key is placed in the START position, with the vehicle in PARK or NEUTRAL, the TR sensor provides power on circuit 50S-BB12 (GY) and the instrument cluster provides ground on circuit 31S-BB12 (BK/YE). The coil of the relay is energized and sends power to the starter motor on circuit 50-BB10 (GY/BK).

Possible Causes

An engine that does not crank can be caused by the following:

- battery.
- central junction box (CJB) fuse 201 (5A).
- auxiliary junction box (AJB) fuse 121 (30A).
- battery junction box (BJB) fuse 22 (20A).
- ignition switch.
- starter relay.
- anti-theft system.
- circuitry.

PINPOINT TEST A: THE ENGINE DOES NOT CRANK

Test Step	Result / Action to Take
A1 CHECK FOR INSTRUMENT CLUSTER DIAGNOSTIC TEST CODES	
• **NOTE:** The instrument cluster PATS DTCs are the only DTCs of concern in this step. Only repair retrieved	**Yes** REFER to Section 419-01B to diagnose the PATS DTCs.

non-PATS DTCs if a customer concern is reported. • Carry out the instrument cluster self-test. Refer to Section 413-00 . • **Were any PATS DTCs retrieved from the instrument cluster?**	**No** GO to A2 .
A2 CHECK THE BATTERY	
• Check the battery condition and charge if necessary. Refer to Section 414-01 . • **Is the battery OK?**	**Yes** GO to A3 . **No** CHARGE or INSTALL a new battery as necessary. REFER to Section 414-01 . TEST the system for normal operation.
A3 CHECK THE BATTERY GROUND CABLE	
• Measure the voltage between the positive battery post and the battery ground cable connection on the engine.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A4 . **No** INSTALL a new battery ground cable. REFER to Section 414-01 . TEST the system for normal operation.
A4 CHECK THE STARTER MOTOR GROUND	
• Measure the voltage between the battery positive post and the starter motor case.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A5 . **No** CLEAN the starter motor mounting flange and make sure the starter motor is correctly mounted. TEST the system for normal operation.
A5 CHECK THE POWER SUPPLY TO THE STARTER MOTOR	
• Measure the voltage between the starter motor B-terminal and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A6 . **No** REPAIR circuit 30-BB10 (RD). TEST the system for normal operation.

A6 CHECK THE STARTER MOTOR B-TERMINAL	
• Connect a fused jumper wire to the B-terminal of the starter motor. Momentarily connect the other lead of the jumper wire to the starter motor S-terminal.  A0002699 • **Did the starter motor engage and the engine crank?**	**Yes** GO to A7 . **No** INSTALL a new starter motor. REFER to Starter Motor 3.0L (4V) or Starter Motor 3.9L in this section. TEST the system for normal operation.
A7 CHECK THE START INPUT TO THE STARTER MOTOR	
• Disconnect: Starter Motor C197. • Measure the voltage between starter motor C197a, circuit 50 BB10 (GY/BK), harness side and ground while holding the ignition switch in the START position.  A0002700 • Key in START position. • **Is the voltage greater than 10 volts in START?**	**Yes** CLEAN the starter motor S-terminal and connector. CHECK the wiring and the starter motor for a loose or intermittent connection. TEST the system for normal operation. **No** GO to A8 .
A8 CHECK THE START INPUT TO THE STARTER RELAY	
• Disconnect: Starter Relay. • Make sure the vehicle is in PARK or NEUTRAL. • Turn the ignition switch to START and hold. • Measure the voltage between starter relay pin 86, circuit 50S-BB12 (GY), harness side and ground.  A0003577 • **Is the voltage greater than 10 volts?**	**Yes** GO to A9 . **No** GO to A14 .

A9 CHECK THE GROUND SUPPLY TO THE STARTER RELAY	
• Make sure the vehicle is in PARK or NEUTRAL. • Turn the ignition switch to START and hold. • Measure the resistance between the starter relay pin 85, circuit 31S-BB12 (BK/YE), harness side and ground.  A0002728 • **Is the resistance less than 5 ohms?**	**Yes** GO to A11 . **No** GO to A10 .
A10 CHECK CIRCUIT 31S-BB12 (BK/YE) FOR AN OPEN	
• Disconnect: Instrument Cluster C220b. • Measure the resistance between starter relay pin 85, circuit 31S-BB12 (BK/YE), harness side and instrument cluster C220b pin 18, circuit 31S-BB12 (BK/YE), harness side.  A0003472 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . **No** REPAIR the circuit. TEST the system for normal operation.
A11 CHECK THE BATTERY SUPPLY TO THE STARTER RELAY	
• Measure the voltage between starter relay pin 30, circuit 30-BB13 (RD), harness side and ground.	**Yes** GO to A12 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0003474 • **Is the voltage greater than 10 volts?**	
A12 CHECK CIRCUITS 50-BB10 (GY/BK) AND 50S-BB12 (GY) FOR AN OPEN	
• Disconnect the eyelet from the starter S-terminal. • Measure the resistance between starter relay pin 87, circuit 50-BB10 (GY/BK), harness side and the S-terminal eyelet C197a, circuit 50-BB10 (GY/BK), harness side.  A0000706 • **Is the resistance less than 5 ohms?**	**Yes** GO to A13 . **No** REPAIR the circuit(s). TEST the system for normal operation.
A13 CHECK CIRCUITS 50-BB10 (GY/BK) AND 50S-BB12 (GY) FOR A SHORT TO GROUND	
• Measure the resistance between starter relay pin 87, circuit 50-BB10 (GY/BK), harness side and S-terminal eyelet C197a, circuit 50-BB10 (GY/BK), harness side.	**Yes** INSTALL a new starter relay. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 A0000706 • **Is the resistance greater than 10,000 ohms?**	
A14 CHECK FUSE 201 (5A)	
• Check fuse: CJB Fuse 201 (5A). • **Is CJB fuse 201 (5A) open?**	**Yes** GO to A21 . **No** GO to A15 .
A15 CHECK THE START INPUT TO FUSE 201 (5A)	
• Disconnect: CJB Fuse 201 (5A). • Turn the ignition switch to the START position and hold. • Measure the voltage between CJB fuse 201 (5A) input terminal and ground.  A0000670 • **Is the voltage greater than 10 volts?**	**Yes** GO to A19 . **No** GO to A16 .
A16 CHECK THE BATTERY INPUT TO THE IGNITION SWITCH	
• Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250 pin 1, circuit 30-BB9 (RD), harness side and ground.  A0000685 • **Is the voltage greater than 10 volts?**	**Yes** GO to A17 . **No** REPAIR the circuit. TEST the system for normal operation.

A17 CHECK CIRCUIT 50-DD5 (GY/BK) FOR AN OPEN	
• Measure the resistance between ignition switch C250 pin 3, circuit 50-DD5 (GY/BK), harness side and CJB fuse 201 (5A) input terminal, circuit 50-DD5 (GY/BK), harness side.  A0004195 • **Is the resistance less than 5 ohms?**	**Yes** GO to A18 . **No** REPAIR the circuit. TEST the system for normal operation.
A18 CHECK CIRCUIT 50-DD5 (GY/BK) FOR A SHORT TO GROUND	
• Measure the resistance between ignition switch C250 pin 3, circuit 50-DD5 (GY/BK), harness side and CJB fuse 201 (5A) input terminal, circuit 50-DD5 (GY/BK), harness side.  A0002692 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ignition switch. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.
A19 CHECK CIRCUIT 50-BB15 (GY/OG) FOR AN OPEN	
• Connect: CJB Fuse 201 (5A). • Disconnect: Digital TR Sensor C167. • Turn the ignition switch to the START position and hold. • Measure the voltage between digital TR sensor C167 pin 10, circuit 50-BB15 (GY/OG), harness side and ground.	**Yes** GO to A20 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0002693 • **Is the voltage greater than 10 volts?**	
A20 CHECK CIRCUIT 50S-BB12 (GY) FOR AN OPEN	
• Measure the resistance between digital TR sensor C167 pin 12, circuit 50S-BB12 (GY), harness side and starter relay pin 86, circuit 50S-BB12 (GY), harness side.  A0002694 • **Is the resistance less than 5 ohms?**	**Yes** ADJUST the digital TR sensor. REFER to Section 307-01 . **No** REPAIR the circuit. TEST the system for normal operation.
A21 CHECK CIRCUIT 50-BB15 (GY/OG) FOR A SHORT TO GROUND	
• Measure the resistance between digital TR sensor C167 pin 10, circuit 50-BB15 (GY/OG), harness side and CJB fuse 201 (5A) output terminal C270b pin 3, circuit 50-BB15 (GY/OG), harness side.  A0009036 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A22 . **No** REPAIR the circuit. TEST the system for normal operation.
A22 CHECK CIRCUIT 50S-BB12 (GY) FOR A SHORT TO GROUND	

• Measure the resistance between digital TR sensor C167 pin 12, circuit 50S-BB12 (GY), harness side and starter relay pin 86, circuit 50S-BB12 (GY), harness side.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A23 . **No** REPAIR the circuit. TEST the system for normal operation.
A23 INSTALL A NEW FUSE 201 (5A)	
• Connect: Digital TR Sensor Switch C167. • Install a new CJB fuse 201 (5A). Retest the system. • **Does the fuse open?**	**Yes** ADJUST the digital TR sensor. REFER to Section 307-01 . **No** TEST the system for normal operation. VERIFY the symptom.

Pinpoint Test B: Unusual Starter Noise

Normal Operation

Under normal operation the power distribution box (PDB) supplies constant power to the starter relay on circuit 30-BB13 (RD) through fuse 121 (30A). When the key is placed in the START position, with the vehicle in PARK or NEUTRAL, the TR sensor provides power on circuit 50S-BB12 (GY) and the instrument cluster provides ground on circuit 31S-BB12 (BK/YE). The coil of the relay is energized and sends power to the starter motor on circuit 50-BB10 (GY/BK).

Possible Causes

Unusual starter noise can be caused by the following:

- loose starter motor mounting bolts or brackets.
- worn or damaged flywheel ring gear.
- worn or damaged starter motor drive gear.

PINPOINT TEST B: UNUSUAL STARTER NOISE

Test Step	Result / Action to Take
B1 CHECK THE STARTER MOUNTING	
• Inspect the starter motor mounting bolts and brackets for looseness.	**Yes** GO to B2 .

• **Is the starter motor mounted correctly?**	**No** INSTALL the starter motor correctly. REFER to Starter Motor 3.0L (4V) or Starter Motor 3.9L in this section. TEST the system for normal operation.
B2 CHECK FOR ENGINE NOISE	
• Turn the ignition switch to the OFF position. • Connect a fused jumper wire from the B-terminal to the S-terminal of the starter motor. Engage the starter motor and verify the noise is due to the starter operation. • **Is the noise due to the starter motor engagement?**	**Yes** GO to B3 . **No** REFER to Section 303-01A or Section 303-01B to continue the diagnosis.
B3 CHECK FOR UNUSUAL WEAR	
• Remove the starter motor. Refer to Starter Motor 3.0L (4V) or Starter Motor 3.9L in this section. • Inspect the ring gear for damaged or worn teeth. • **Is the noise due to flywheel ring gear tooth damage?**	**Yes** INSTALL a new flywheel ring gear. EXAMINE the starter pinion teeth. If damaged, INSTALL a new starter motor. REFER to Starter Motor 3.0L (4V) or Starter Motor 3.9L in this section. TEST the system for normal operation. **No** INSTALL a new starter motor. REFER to Starter Motor 3.0L (4V) or Starter Motor 3.9L in this section. TEST the system for normal operation.

Component Tests

⚠ WARNING: When repairing the starter motor or carrying out other underhood work in the vicinity of the starter motor, be aware that the heavy gauge battery input lead at the starter solenoid is "electrically hot" at all times. Failure to follow these instructions can result in personal injury.

⚠ CAUTION: A protective cap or boot is provided over the battery input terminal on all vehicle lines and must be installed after repairing. Be sure to disconnect the battery ground cable before repairing the starter motor.

Connect the 73III Automotive Meter at the component terminal rather than at the wiring end connector. Making a connection at the wiring end connector could result in false readings because the meter will not pick up a high resistance between the wiring connector and the component.

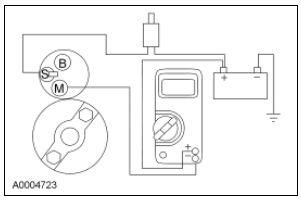
Starter Motor Motor Feed Circuit

1. Make sure the battery is fully charged. Carry out a battery load test. For additional information, refer to Section 414-01 .

2. Disconnect the inertia fuel shutoff (IFS) switch (9341).

3. Connect a remote starter switch between the starter solenoid S-terminal and the battery positive (+) terminal.

4. Connect the 73III Automotive Meter positive lead to the battery positive (+) post. Connect negative lead to the M-terminal.



5. Engage the remote starter switch. Read and record the voltage. The voltage reading should be 0.8 volt or less.

6. If the voltage reading is 0.8 volt or less, go to the Starter Motor Ground Circuit Component Test.

7. If the voltage reading is greater than 0.8 volt, this is an indication of excessive resistance in the connections, the positive battery cable or in the starter solenoid. Move the 73III Automotive Meter negative lead to the starter solenoid B-terminal and repeat the test. If the voltage reading at the B-terminal is lower than 0.8 volt, the concern is either in the connections at the starter solenoid or in the solenoid contacts.

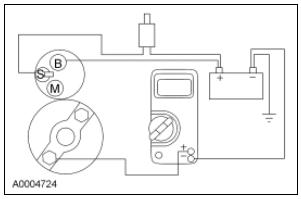
8. Remove the cables from solenoid B-, S- and M-terminals. Clean the cables and connections and reinstall the cables to the correct terminals. Repeat Steps 3 through 6. If the voltage drop reading is still greater than 0.8 volt when checked at the M-terminal and less than 0.8 volt when checked at the B-terminal, the concern is in the solenoid contacts. Install a new starter motor.

9. If the voltage reading taken at the solenoid B-terminal is still greater than 0.8 volt after cleaning the cables and the connections at the solenoid, the concern is either in the positive (+) battery cable connection or in the positive battery cable itself. Clean the positive (+) battery cable connection. If this does not solve the problem, install a new positive battery cable. For additional information, refer to Section 414-01 .

Starter Motor Ground Circuit

A slow cranking condition can be caused by resistance in the ground or return portion of the cranking circuit. Check the voltage drop in the ground circuit as follows:

1. Connect the 73III Automotive Meter positive lead to the starter motor housing (the connection must be clean and free of rust or grease). Connect the negative lead to the negative (-) battery terminal.

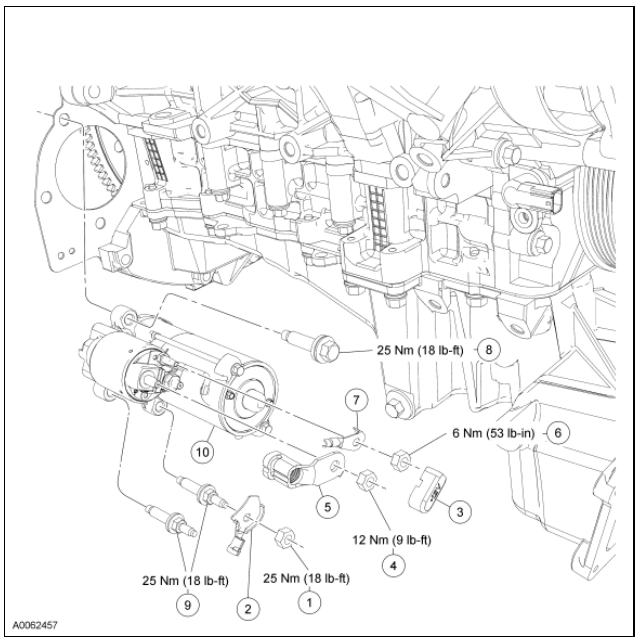


2. Engage the remote starter switch and crank the engine. Read and record the voltage reading. The reading should be 0.5 volt or less.

3. If the voltage is more than 0.5 volt, clean the negative cable connections at the battery, the body ground connections, and the starter ground connections. Retest.

4. If the voltage is more than 0.5 volt, install a new cable. If the voltage reading is less than 0.5 volt and the engine still cranks slowly, install a new starter motor.

Starter Motor 3.0L (4V) Printable View (176 KB)



Item	Part Number	Description
1	N500617	Ground strap nut
2	14463	Ground strap
3	11N087	Starter motor solenoid terminal cover
4	N800136	Starter solenoid battery cable nut
5	14463	Starter solenoid battery cable
6	N800156	Starter solenoid wire nut
7	14463	Starter solenoid wire
8	W704666	Starter motor bolt
9	W705359	Starter motor stud bolts (2 required)
10	11000	Starter motor

Removal and Installation

⚠ WARNING: When carrying out maintenance on the starting system be aware that the heavy gauge leads are connected directly to the battery. Make sure the protective caps are in place when maintenance is completed.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Remove the ground strap nut and position the ground strap aside.
   - To install, tighten to 25 Nm (18 lb-ft).

4. Remove the starter motor solenoid terminal cover.

5. Remove the starter solenoid battery cable nut and position the starter solenoid battery cable aside.

- To install, tighten to 12 Nm (9 lb-ft).

6. Remove the starter solenoid wire nut and position the starter solenoid wire aside.
   - To install, tighten to 6 Nm (53 lb-in).

7. Remove the 2 starter motor stud bolts, bolt and the starter motor.
   - Install the starter motor upper bolt and lower stud bolts hand-tight. Tighten the upper bolt to 25 Nm (18 lb-ft), followed by the lower stud bolts to 25 Nm (18 lb-ft).

8. To install, reverse the removal procedure.

Engine Ignition

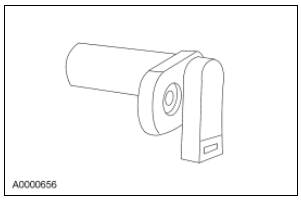
Printable View (31 KB)

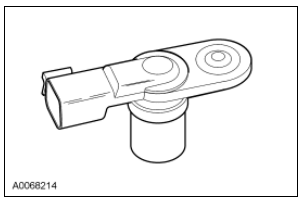
The electronic ignition (EI) system is a coil-on-plug (COP) ignition system. The COP ignition system consists of the following components:

- crankshaft position (CKP) sensor.
- camshaft position (CMP) sensor.
- ignition coils.
- spark plugs.



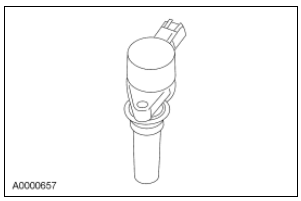
The crankshaft position sensor:

- is a variable reluctance sensor.
- is triggered by a 36-minus-1 tooth trigger wheel mounted on the crankshaft.
- provides base timing and crankshaft speed (rpm) to the powertrain control module (PCM).



The camshaft position sensor:

- sends the powertrain control module (PCM) a signal indicating camshaft position used for fuel and spark synchronization.



The 6 separate ignition coils:

- convert low voltage signals from the powertrain control module to high voltage pulses.
- produce the high voltage pulses for the spark plugs.
- are connected directly to each spark plug.

The spark plugs:

- convert a high voltage pulse into a spark which ignites the fuel and air mixture.
- originally equipped on the vehicle have a platinum-enhanced active electrode for long life.

Engine Emission Control

Printable View (17 KB)

⚠ CAUTION: Do not remove any part of the engine emission control system. Operating the engine without the engine emission control system will reduce fuel economy and engine ventilation. This will weaken engine performance and shorten engine life.

The engine emission control consists of the:

- positive crankcase ventilation (PCV) system.
- exhaust gas recirculation (EGR) system module.

The Vehicle Emission Control Information (VECI) decal shows:

- the components of the emission control system.
- the correct vacuum hose routing.

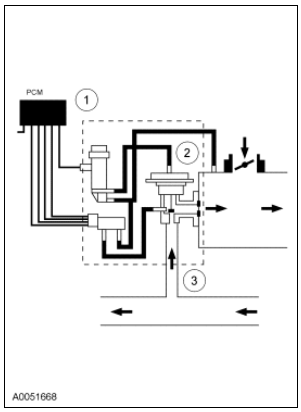
For additional information, refer to Section 100-02 .

The PCV system uses intake manifold vacuum to ventilate the crankcase and return the fumes to the intake manifold for combustion.

The PCV valve (3.0L only):

- controls the amount of ventilating air and blow-by gases going to the intake manifold.
- prevents a backfire from reaching the crankcase.

EGR System Components



Item	Part Number	Description
1	12A650	Powertrain control module
2	9J459	EGR system module
3	9D475	EGR valve-to-exhaust manifold tube

The EGR system returns a portion of the exhaust gas to the intake manifold to reduce the combustion temperature. This results in lower nitrous oxide formation.

The powertrain control module (PCM) controls the EGR vacuum regulator solenoid. The EGR vacuum regulator solenoid controls the vacuum to the EGR system module. When the EGR valve opens, exhaust gas flows to the intake manifold. The differential pressure feedback sensor measures the flow through the EGR

valve from the exhaust manifold tube and sends a signal to the PCM. A metering orifice in the EGR valve-to-exhaust manifold tube restricts the flow rate when the EGR valve is open.

Engine Emission Control

Evaporative Emissions

Printable View (13 KB)

The evaporative emission (EVAP) system:

- is equipped with an on-board refueling vapor recovery (ORVR) system.
- prevents hydrocarbon emissions from reaching the atmosphere.
- stores fuel vapors in the EVAP canister that are generated during vehicle refueling, vehicle operation or hot soak until they can be consumed by the engine.
- routes the stored fuel vapors to the engine during engine operation.
- is controlled by the powertrain control module (PCM) which uses various sensor inputs to calculate the desired amount of purge flow. The PCM regulates the purge flow, induced by the application of intake manifold vacuum, by varying the duty cycle applied to the EVAP canister purge valve.
- has an EVAP test port for test purposes.

The fuel vapors are routed:

- from the fuel tank through the fuel vapor control valve and fuel vapor vent valve.
- to the EVAP canister through a vapor line.
- to the engine when the EVAP canister purge valve is opened by the PCM.

The fuel tank pressure (FTP) sensor:

- monitors the pressure levels in the fuel tank.
- communicates the pressure reading to the PCM during the OBD II leak test.
- is permanently attached to the fuel vapor control valve tube assembly.

The evaporative emission canister assembly:

- is located above the rear subframe.
- contains activated carbon.
- stores fuel vapors.

The fuel tank filler cap:

- relieves system pressure above 17 kPa (68.24 inches H_2O).
- relieves system vacuum below 5.65 kPa (22.68 inches H_2O).

The canister vent solenoid:

- is normally open.
- seals the EVAP system for the inspection and maintenance (I/M 240) test and OBDII leak and pressure tests.
- is mounted on the EVAP canister bracket assembly.
- is repaired as a separate item.

The evaporative emission (EVAP) canister purge valve:

- is normally closed.
- regulates purging of the EVAP canister.
- is controlled by the PCM.
- is located in the engine compartment on the LH strut tower.

The fuel vapor vent (FVV) valve:

- is permanently mounted to the fuel tank.
- prevents suspended liquid fuel from being drawn into the EVAP canister along with the fuel vapors.

The fuel vapor control valve:

- is permanently mounted to the fuel tank.
- controls fuel tank refueling fill level.
- prevents suspended liquid fuel from being drawn into the EVAP canister along with the fuel vapors.
- relieves system pressure above 14 kPa (56.21 inches H_2O).

The underbody fuel supply and vapor tube assembly:

- is located under the LH rocker panel.
- includes both the fuel supply line and the EVAP canister purge outlet tube.
- supplies fuel from the fuel pump to the fuel filter.
- routes fuel vapors from the fuel vapor control valve tube assembly to the engine compartment fuel supply and vapor tube.
- is repaired as an assembly.

The engine compartment fuel supply and vapor tube assembly:

- is located on the LH side of the engine compartment.
- supplies fuel from the fuel filter to the fuel injection supply manifold.
- routes fuel vapors from the underbody fuel supply and vapor tube assembly to the EVAP canister purge valve.
- is repaired as an assembly.

The evaporative emission (EVAP) system monitor:

- is a self-test strategy within the PCM, which tests the integrity of the EVAP system.
- monitors the EVAP system for leaks.
- monitors electronic EVAP components for irrationally high or low voltages.
- monitors for correct EVAP system operation.
- uses negative leak test method to test and activate the EVAP system.

The evaporative emission (EVAP) test port:

- is used to connect the Evaporative Emission System Leak Tester to the EVAP system.
- is located on the EVAP canister purge valve.

The EVAP Running Loss System Leak Test:

- utilizes intake manifold vacuum to test the EVAP system and involves several stages.

Evaporative Emissions

Printable View (7 KB)

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Evaporative Emission System Leak Test

Printable View (15 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool

Phase 1 Leak Verification

1. Connect the Rotunda Smoke Machine Leak Tester to the evaporative emission (EVAP) test port. For additional information, refer to the manufacturer's instructions.
2. Close the canister vent solenoid. For additional information, refer to Canister Vent Solenoid Closing Procedure in this section.
3. Using the Rotunda Smoke Machine, pressurize the EVAP system.
4. Monitor the indicator flag on the Smoke Machine Tester. If the measurement is below the indicator flag, the system has passed the leak test and the test procedure is complete. If the measurement is above the indicator flag, the system has failed the leak test. Proceed to Phase 2.

Phase 2 System Leak Check

1. Introduce smoke from the Rotunda Smoke Machine into the EVAP system. For additional information, refer to the manufacturer's instructions.
2. Use the halogen light provided with the Smoke Machine to look for smoke coming from the EVAP system. This would indicate a leak point.
3. Repair any leaks as necessary.
4. Repeat the leak test until the system passes.

Evaporative Emission Repair Verification Drive Cycle

Printable View (21 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool

Drive Cycle Recommendations

NOTE: The following procedure is designed to execute and complete the evaporative emission repair verification drive cycle and to clear the Ford P1000, inspection and maintenance (I/M) readiness code. When the ambient air temperature is below 4.4°C (40°F) or above 37.8°C (100°F), or the altitude is above 2,438 meters (8,000 feet), the EVAP monitor will not run. If the P1000 must be cleared in these conditions, the powertrain control module (PCM) must detect them once (twice on some applications) before the EVAP monitor can be bypassed and the P1000 cleared. The EVAP bypassing procedure is described in the following drive cycle.

1. Most OBD II monitors will complete more readily using a steady foot driving style during cruise or acceleration modes. Operating the throttle in a smooth fashion will minimize the time necessary for monitor completion.

2. Fuel tank level should be between one-half and three-quarters full with three-quarters full being the most desirable.

3. The evaporative monitor can only operate during the first 30 minutes of engine operation. When executing the procedure for this monitor, stay in part throttle mode and drive in a smooth fashion to minimize fuel slosh.

Drive Cycle Preparation

NOTE: For best results, follow each of the following steps as accurately as possible.

4. **NOTE:** This step bypasses the engine soak timer and resets OBD II monitor status.

   Install the diagnostic tool. Turn the key ON with the engine OFF. Cycle the key off, then on. Select the appropriate vehicle and engine qualifier. Clear all diagnostic trouble codes (DTCs) and carry out a PCM reset.

5. Begin to monitor the following PIDs: ECT, EVAPDC, FLI (if available) and TP MODE. Press Diagnostic Data Link, PCM, PID/Data monitor and record, press trigger to select each PID, then start.

6. Start the engine without returning the key to the OFF position.

Preparation for Monitor Entry

⚠ WARNING: Strict observance of posted speed limits and attention to driving conditions are mandatory when proceeding through the following drive cycle.

7. **NOTE:** This step allows engine warm-up and provides intake air temperature (IAT) input to the PCM.

   Idle the vehicle for 15 seconds. Drive at 64 km/h (40 mph) until the ECT is at least 76.7°C (170°F).

8. Is IAT above 4.4°C (40°F) and below 37.8°C (100°F)? If not, continue with the following steps but note that the EVAP Monitor Bypass portion of the drive cycle (Step 13) will be required to bypass the EVAP monitor and clear the P1000.

9. **NOTE:** This step executes the heated oxygen sensor (HO2S) monitor.

   Cruise at 64 km/h (40 mph) for 60 seconds.

10. **NOTE:** This executes the EVAP monitor if IAT is above 4.4°C (40°F) and below 37.8°C (100°F).

    NOTE: To initiate the monitor, TP MODE should equal PT, EVAPDC must be greater than 75%, and FLI must be between 15 and 85%.

    NOTE: Avoid sharp turns and hills.

    Cruise at 72 to 104 km/h (45 to 65 mph) for 10 minutes.

11. **NOTE:** This step executes the ISC portion of the Secondary Air/CCM.

    Bring the vehicle to a stop. Idle with the transmission in DRIVE (for automatic transmission) or NEUTRAL (for manual transmission) for 2 minutes.

Pending Code and EVAP Monitor Bypass Check

12. **NOTE:** This determines if a pending code is preventing the clearing of P1000.

    NOTE: If the EVAP monitor is not complete and IAT was below 4.4°C (40°F) or above 37.8°C (100°F) temperature range in Step 8, or the altitude is above 2,438 meters (8,000 feet), the EVAP Monitor Bypass (Step 13) must be carried out.

    Using the diagnostic tool, check for pending codes. Conduct normal repair procedures for any pending code concerns. Rerun any incomplete monitor.

EVAP Monitor Bypass

13. **NOTE:** This allows the bypass counter to increment to 2.

    NOTE: Do not repeat Step 4.

    Park the vehicle for a minimum of 8 hours. Repeat Steps 5 through 12.

Canister Vent Solenoid Closing Procedure

Printable View (16 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool

⚠ CAUTION: The canister vent solenoid must not be energized for more than 9 minutes at one time. Once the canister vent solenoid is energized and de-energized, adequate time must be allowed for the component to cool adequately. Failure to allow the component to cool may create a false failure in the diagnostics, causing unnecessary repairs.

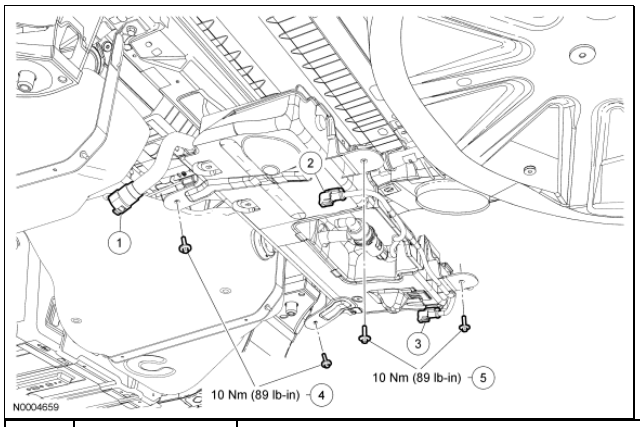
1. Connect the diagnostic tool and select the output test mode.
2. If PID monitors are not active, select PIDs.
3. Select the fuel tank pressure (FTP) and the volts (V) parameter identification (PID) for monitoring.
4. Select the ALL OFF mode.
5. Close the canister vent solenoid by pushing the START button on the diagnostic tool.

Evaporative Emission Canister

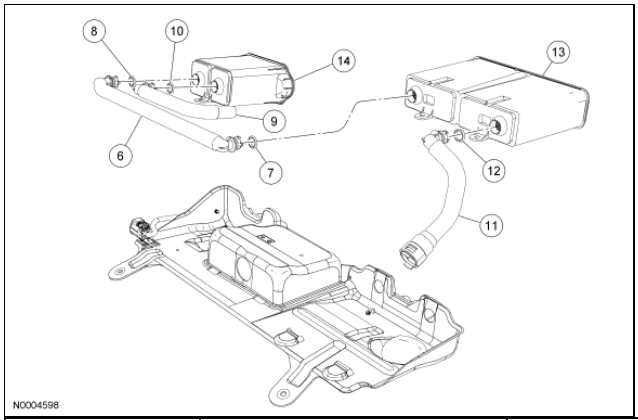
Printable View (236 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A



Item	Part Number	Description
1	9J274	Fuel vapor tube quick-connect fitting (part of 9D667)
2	14A464	Evaporative emissions (EVAP) canister electrical connector (part of 9F759)
3	14A464	EVAP canister electrical connector (part of 9F759)
4	W503925	EVAP canister bracket assembly bolts (2 required)
5	W503925	EVAP canister bracket assembly bolts (2 required)



Item	Part Number	Description
6	9E616	Fuel vapor return tube
7	N811263	O-ring seal
8	N811263	O-ring seal

9	9E616	Fuel vapor tube
10	N811263	O-ring seal
11	9D667	Fuel vapor tube
12	N811263	O-ring seal
13	9D653	EVAP canister
14	9D653	EVAP canister

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions can result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Remove the rear subframe. For additional information, refer to Section 502-00 .
4. Disconnect the vapor tube.
5. Disconnect the 2 evaporative emissions (EVAP) canister electrical connectors.
6. Remove the 4 EVAP canister bracket assembly bolts and the EVAP canister and bracket assembly.
   - To install, tighten to 10 Nm (89 lb-in).
7. Remove the 3 fuel vapor tubes from the EVAP canisters.
   - Inspect and install new O-ring seals as necessary.
8. Remove the rivet and the EVAP canisters.
9. **NOTE:** Lubricate the O-ring seals with clean engine oil.

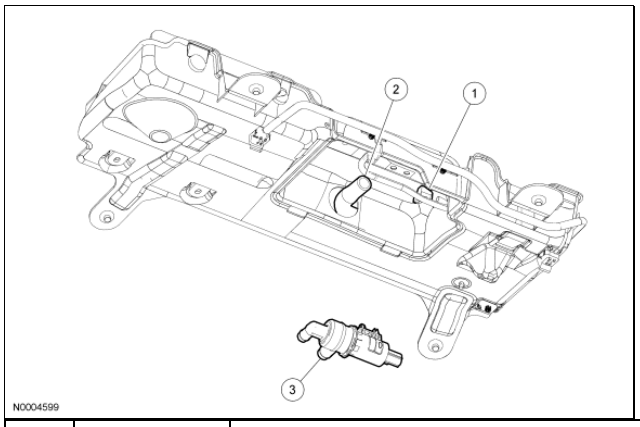
   To install, reverse the removal procedure.
10. Carry out a leak test. For additional information, refer to Evaporative Emission System Leak Test in this section.
11. Carry out the evaporative emission repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Evaporative Emission Canister Vent Solenoid

Printable View (94 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A



Item	Part Number	Description
1	14A464	Evaporative emissions (EVAP) canister vent solenoid electrical connector (part of 9F759)
2	9E616	Fuel vapor tube
3	9F945	EVAP canister vent solenoid

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions can result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

1. Disconnect the battery ground cable. For additional information, refer to Section 100-02 .
2. Disconnect the evaporative emissions (EVAP) canister vent solenoid electrical connector.
3. Disconnect the EVAP hose and remove the EVAP canister vent solenoid.
4. **NOTE:** Make sure the electrical connector harness is correctly routed.

   NOTE: To ease installation, lubricate the inside of the EVAP hose with clean engine oil.

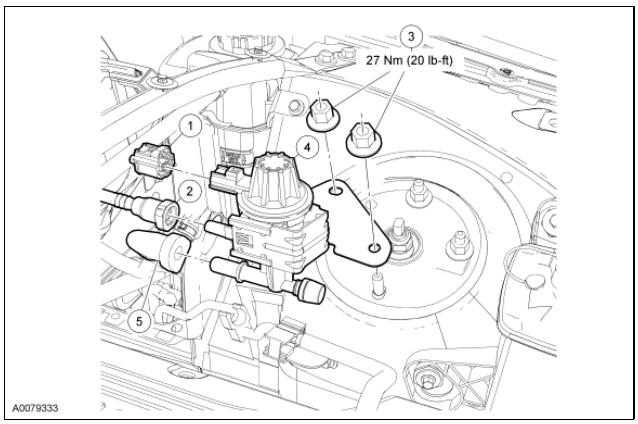
To install, reverse the removal procedure.

5. Carry out the evaporative emission system leak test. For additional information, refer to Evaporative Emission System Leak Test in this section.

6. Carry out the evaporative emission repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Evaporative Emission Canister Purge Valve

Printable View (131 KB)



Item	Part Number	Description
1	14A464	Evaporative emissions (EVAP) canister purge valve electrical connector
2		Vapor tube quick-release fitting (part of 9B049)
3	W704790	EVAP canister purge valve mounting nuts
4	9B593	EVAP canister purge valve
5		Vapor tube quick-release fitting (part of 9D677)

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions can result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

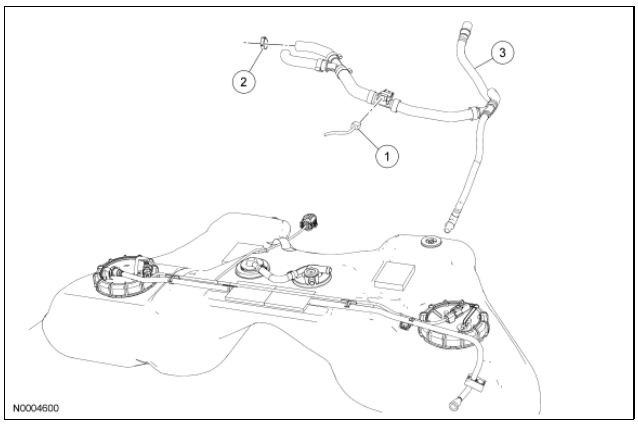
1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the evaporative emissions (EVAP) canister purge valve electrical connector.
3. Disconnect the upper fuel vapor tube from the EVAP purge valve.
4. Remove the 2 EVAP canister purge valve bracket nuts.
   - To install, tighten to 27 Nm (20 lb-ft).
5. Detach the EVAP canister purge valve bracket from the studs, disconnect the lower fuel vapor tube and remove the EVAP canister purge valve.
6. To install, reverse the removal procedure.

7. Carry out a leak test. For additional information, refer to Evaporative Emission System Leak Test in this section.

8. Carry out the evaporative emission repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

Fuel Vapor Control Tube Assembly Valve

Printable View (65 KB)



Item	Part Number	Description
1	14A464	Fuel tank pressure sensor electrical connector (part of 9F759)
2	3C750	Fuel vapor hose clamp
3	9C047	Fuel vapor control tube assembly valve

Removal and Installation

⚠ WARNING: The evaporative emission system contains fuel vapor and condensed fuel vapor. Although not present in large quantities, it still presents the danger of explosion or fire. Disconnect the battery ground cable from the battery to minimize the possibility of an electrical spark occurring, possibly causing a fire or explosion if fuel vapor or liquid fuel are present in the area. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions may result in personal injury.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the fuel tank. For additional information, refer to Section 310-01 .
3. Disconnect the fuel tank pressure sensor electrical connector
4. Disconnect the fuel vapor tube and remove the fuel vapor control tube assembly valve.
5. To install, reverse the removal procedure.
6. Carry out a leak test. For additional information, refer to Evaporative Emission System Leak Test in this section.
7. Carry out the evaporative emission repair verification drive cycle. For additional information, refer to Evaporative Emission Repair Verification Drive Cycle in this section.

General Specifications

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C930-A
High Temperature Nickel Anti-Seize Lubricant XL-2 (in Canada CXG-2) or equivalent	ESE-M12A4-A
Penetrating and Lock Lubricant XL-1 or equivalent	

Torque Specifications

Description	Nm	lb-ft	lb-in
Camshaft position (CMP) sensor bolts	10		89
Crankshaft position (CKP) sensor bolt	10		89
Cross-vehicle support	20	15	
Cylinder head temperature (CHT) sensor	22	16	
Fuel pressure sensor shield stud bolt	6		53
Fuel pressure sensor shield bolts	10		89
Fuel pressure sensor bolts	4		35
Ground strap bolt	10		89
Heated oxygen sensor (HO2S) and catalyst monitor sensor	41	30	
Intake manifold tuning valve bolts	10		89
Knock sensor (KS) bolt	20	15	
Mass air flow (MAF) sensor	2		18
Powertrain control module (PCM) nuts	8		71
PCM bracket bolts	7		62
Upper intake support bracket nut	10		89
Upper intake support bracket bolts	10		89

Electronic Engine Controls

Printable View (12 KB)

The electronic engine controls consist of the following:

- Powertrain control module (PCM)
- Two throttle position (TP) sensors
- Two camshaft position (CMP) sensors
- Crankshaft position (CKP) sensor
- Mass air flow (MAF) sensor
- Heated oxygen sensors (HO2S)
- Catalyst monitor sensors
- Knock sensor (KS)
- Cylinder head temperature (CHT) sensor
- Power steering pressure (PSP) switch
- Fuel pressure sensor
- Fuel temperature sensor
- Two intake manifold tuning (IMT) valves

The PCM carries out the following functions:

- accepts inputs from various engine sensors to compute the fuel flow rate necessary to maintain a prescribed air/fuel ratio and spark synchronization throughout the entire engine operating range.
- outputs a command to the fuel injectors to meter the appropriate quantity of fuel.

The TP sensors:

- send the PCM a signal indicating the throttle plate angle.
- are the main input to the PCM from the driver.

The CMP sensors:

- send the PCM a signal indicating camshaft position used for fuel and spark synchronization.

The CKP sensor:

- sends the PCM a signal indicating crankshaft position.
- is essential for calculating spark timing.

The MAF sensor:

- sends the PCM a signal indicating mass airflow rate of air entering the engine.

The front HO2S:

- create a voltage signal dependent on exhaust oxygen content.
- provide feedback information to the PCM used to calculate fuel delivery.

The catalyst monitor sensors:

- monitor oxygen content after it flows through the catalytic converter.
- provide a voltage signal to the PCM used to calculate catalytic converter integrity.

The KS:

- is used to detect engine detonation.
- sends a voltage signal to the PCM.
- is able to provide a signal which retards the ignition timing, if necessary.

The cylinder head temperature sensor:

- is mounted into the wall of the cylinder head and is not connected to any coolant passages.
- sends a signal to the PCM indicating the cylinder head temperature.
    - ♦ If the temperature exceeds approximately 121°C (250°F), the PCM disables half the fuel injectors at a time. The PCM will alternate which fuel injectors are disabled every 32 engine cycles. The cylinders that are not being fuel injected act as air pumps to aid in engine cooling.
    - ♦ If the temperature exceeds approximately 166°C (330°F), the PCM disables all of the fuel injectors until the engine temperature drops below approximately 154°C (310°F).
    - ♦ The coolant temperature gauge pointer will read fully hot.
    - ♦ The check gauge warning indicator will illuminate and DTCs are set.

The PSP switch:

- monitors the outlet pressure of the power steering pump and is calibrated to both an actuation and release pressure setting.
- increases the outlet pressure to match the severity of the turn maneuver.

The fuel pressure sensor:

- sends the PCM a signal indicating fuel pressure.
    - ♦ The PCM uses the fuel pressure sensor signal to maintain the fuel liquid pressure in the fuel line which reduces the fuel vapor pressure in the fuel line.

The fuel temperature sensor:

- sends the PCM a signal indicating fuel temperature.
    - ♦ The PCM uses the fuel temperature sensor signal to help maintain a prescribed air/fuel ratio and spark synchronization throughout the entire engine operating range.

The IMT valves:

- connect the plenums to improve upper rpm power.

Electronic Engine Controls

Printable View (7 KB)

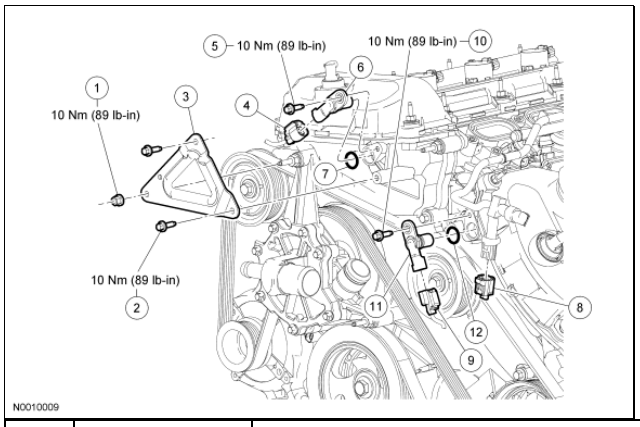
Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Camshaft Position (CMP) Sensor 3.0L (4V)

Printable View (167 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A



Item	Part Number	Description
1	701542	Upper intake support bracket nut
2	W701719	Upper intake support bracket bolt (2 required)
3	9J444	Upper intake support bracket
4	14A464	RH camshaft position (CMP) sensor electrical connector
5	500214	RH CMP sensor bolt
6	6B288	RH CMP sensor
7		O-ring seal
8	14A464	Fuel temperature sensor electrical connector
9	14A464	LH CMP sensor electrical connector
10	500214	LH CMP sensor bolt
11	6B288	LH CMP sensor
12		O-ring seal

Removal and Installation

Both camshaft position (CMP) sensors

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the air cleaner assembly. For additional information, refer to Section 303-12 .
3. Remove the throttle body. For additional information, refer to Section 303-04A .

RH CMP sensor

4. Remove the 2 bolts, the nut and the upper intake manifold support bracket.
    - To install, tighten to 10 Nm (89 lb-in).

5. Disconnect the RH CMP electrical connector.

6. Remove the bolt and the RH CMP sensor.
    - To install, tighten to 10 Nm (89 lb-in).
    - Inspect and install a new O-ring seal as necessary.

LH CMP sensor

7. Remove the fuel tube bracket bolt and position the fuel tube aside.
    - To install, tighten to 10 Nm (89 lb-in).

8. Disconnect the LH CMP sensor electrical connector.

9. Remove the bolt and the LH CMP sensor.
    - To install, tighten to 6 Nm (53 lb-in).
    - Inspect and install a new O-ring seal as necessary.

Both CMP sensors

10. **NOTE:** Lubricate the O-ring seals with clean engine oil.

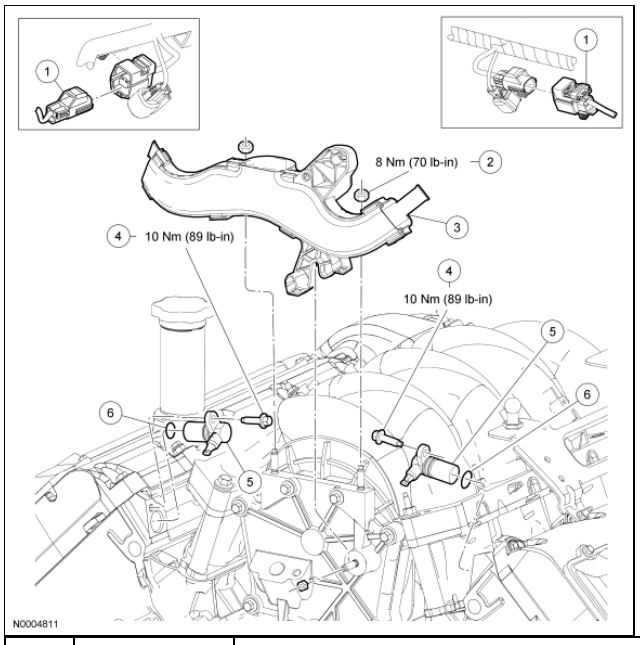
    To install, reverse the removal procedure.

Camshaft Position (CMP) Sensor 3.9L

Printable View (268 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A



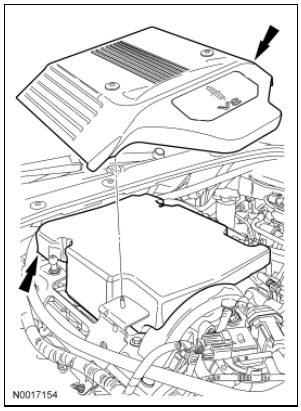
Item	Part Number	Description
1	14A464	Camshaft position (CMP) sensor electrical connectors (2 required) (part of 12B637)
2	W520101	Engine wiring harness conduit nuts (3 required)
3		Engine wiring harness conduit (part of 12B637)
4	W500214	CMP sensor bolts (2 required)
5	6B288	CMP sensors (2 required)
6		O-ring seals (2 required)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. ⚠ **CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

   Remove the engine appearance cover and the noise suppressor (if detached).



3. Disconnect the 2 camshaft position (CMP) sensor electrical connectors.

4. Remove the ground strap nut and position the ground strap aside.
   - To install, tighten to 10 Nm (89 lb-in).

5. Remove the 3 nuts and position the wiring harness conduit aside.
   - To install, tighten to 8 Nm (70 lb-in).

6. Remove the 2 bolts and the LH and RH CMP sensors.
   - To install, tighten to 10 Nm (89 lb-in).
   - Inspect and install new O-ring seals as necessary.

7. **NOTE:** Lubricate the O-ring seals with clean engine oil.

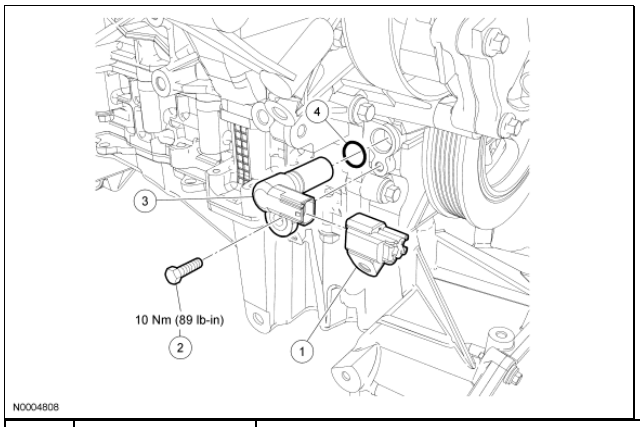
To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor 3.0L (4V)

Printable View (127 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A



Item	Part Number	Description
1	14A464	Crankshaft position (CKP) sensor electrical connector
2	500212	CKP sensor bolt
3	6C315	CKP sensor
4		O-ring seal

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the crankshaft position (CKP) sensor electrical connector.

4. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).
   - Inspect and install a new O-ring seal as necessary.

5. **NOTE:** Lubricate the O-ring seal with clean engine oil.

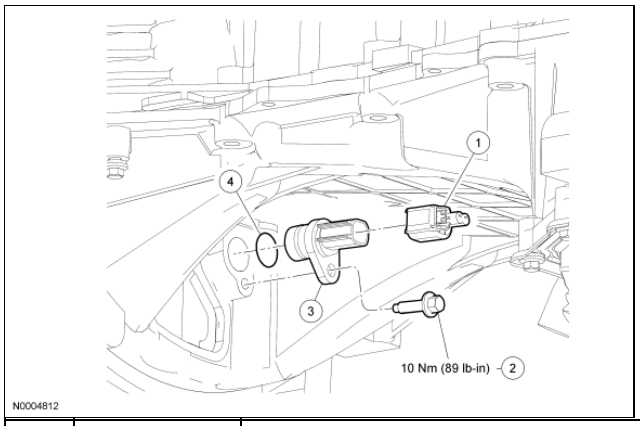
   To install, reverse the removal procedure.

Crankshaft Position (CKP) Sensor 3.9L

Printable View (87 KB)

Material

Item	Specification
Motorcraft SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W-20-QSP (in Canada Motorcraft SAE 5W-20 Super Premium Motor Oil CXO-5W20-LSP12) or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	14A464	Crankshaft position (CKP) sensor electrical connector (part of 12B637)
2	W500214	CKP sensor bolt
3	6C315	CKP sensor
4		O-ring seal

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the crankshaft position (CKP) sensor electrical connector.

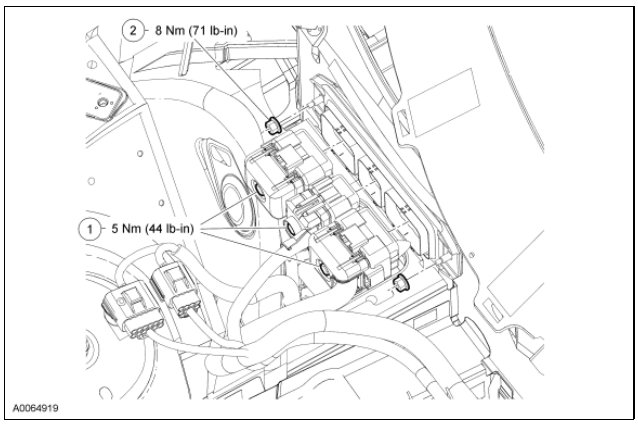
4. Remove the bolt and the CKP sensor.
   - To install, tighten to 10 Nm (89 lb-in).
   - Inspect and install a new O-ring seal as necessary.

5. **NOTE:** Lubricate the O-ring seal with clean engine oil.

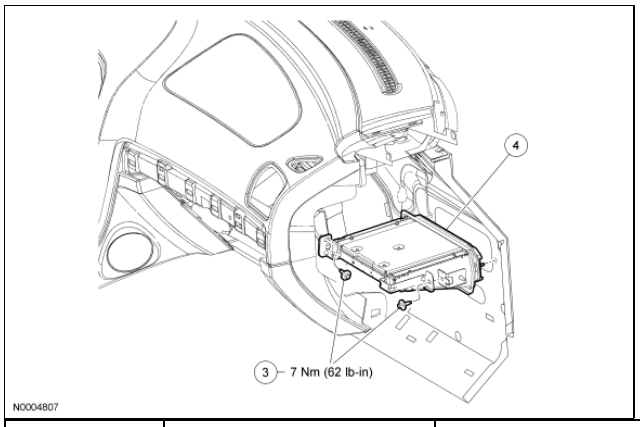
   To install, reverse the removal procedure.

Powertrain Control Module (PCM)

Printable View (234 KB)



Item	Part Number	Description
1	14A464	Powertrain control module (PCM) electrical connectors (3 required)
2	N621927	PCM nuts (2 required)



Item	Part Number	Description
3	606625	PCM bracket bolts (2 required)
4	031400	PCM and bracket

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the cabin air filter plenum. For additional information, refer to Section 412-01 .

3. Remove the glove compartment.

4. Disconnect the 3 powertrain control module (PCM) electrical connectors.
   - To install, tighten to 5 Nm (44 lb-in).

5. Remove the 2 PCM nuts.
   - To install, tighten to 8 Nm (71 lb-in).

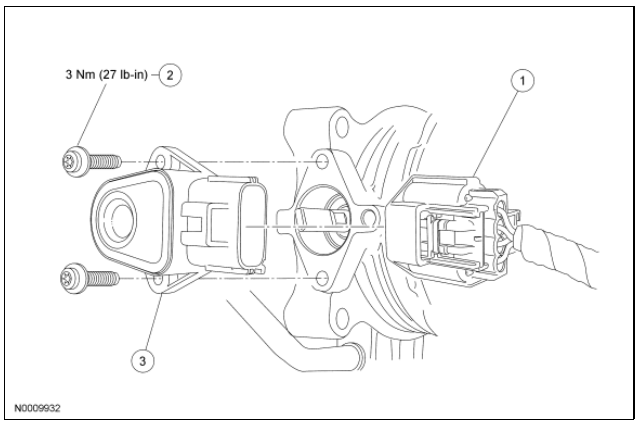
6. Remove the 2 PCM bracket bolts.
    - To install, tighten to 7 Nm (62 lb-in).

7. Remove the PCM and bracket as an assembly through the glove compartment opening.

8. To install, reverse the removal procedure.

Throttle Position (TP) Sensor

Printable View (73 KB)



Item	Part Number	Description
1	14A464	Throttle position (TP) sensor electrical connector
2	W707535	TP screws (2 required)
3	9E928	TP sensor

Removal

All vehicles

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

Vehicles with 3.9L engine

2. Remove the throttle body. For additional information, refer to Section 303-04B .

Vehicles with 3.0L engine

3. Disconnect the throttle position (TP) sensor electrical connector.

All vehicles

4. **⚠ CAUTION: Failure to remove the TP sensor screws in the following manner will result in damage to the screws. First loosen the screws 1-2 full turns using a hand tool and then use a suitable high speed driver to complete the removal.**

   Remove and discard the 2 screws and the TP sensor.

Installation

All vehicles

1. **⚠ CAUTION: Do not reuse the TP sensor and screws. A new TP sensor and screws must be installed.**

   ⚠ CAUTION: Do not use a high speed driver to install the new screws or damage to the TP sensor can occur.

NOTE: When installing the new TP sensor, make sure that the radial locator tab on the TP sensor is aligned with the radial locator hole on the throttle body.

Position the new TP sensor and install the 2 new screws.

- Tighten to 3 Nm (27 lb-in).

Vehicles with 3.0L engine

2. Connect the TP sensor electrical connector.

Vehicles with 3.9L engine

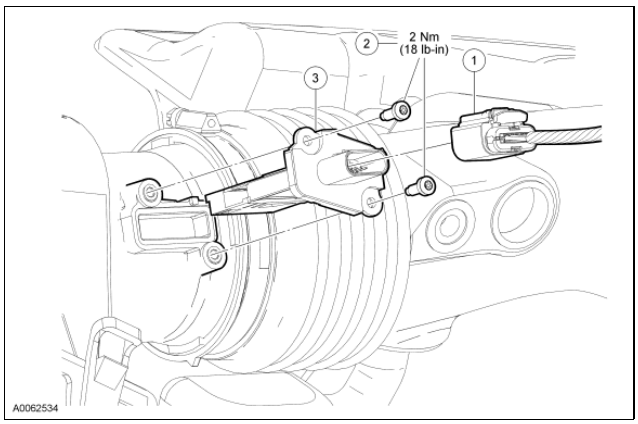
3. Install the throttle body. For additional information, refer to Section 303-04B .

All vehicles

4. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Mass Air Flow (MAF) Sensor

Printable View (105 KB)



Item	Part Number	Description
1	14A464	Mass air flow (MAF) sensor electrical connector (part of 12B637)
2		MAF sensor bolts (2 required)
3	12B605	MAF sensor

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

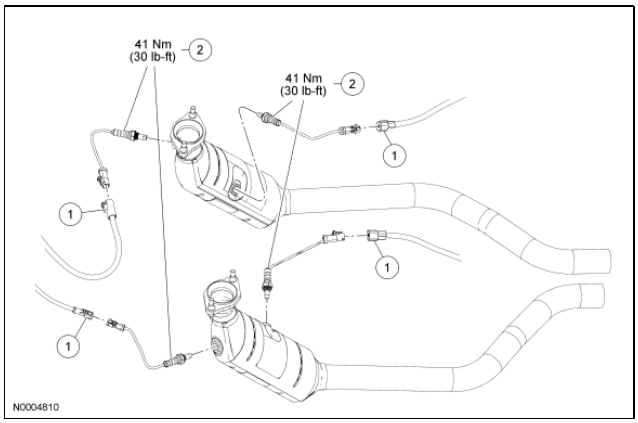
2. Disconnect the mass air flow (MAF) sensor electrical connector.

3. Remove the 2 bolts and the MAF sensor.
   - To install, tighten to 2 Nm (18 lb-in).

4. To install, reverse the removal procedure.

Heated Oxygen Sensor (HO2S) and Catalyst Monitor Sensor Exploded View

Printable View (66 KB)



Item	Part Number	Description
1	14A464	Heated oxygen sensor (HO2S) and catalyst monitor sensor electrical connectors (part of 12B637)
2	9G472	Heated oxygen sensor (HO2S) and catalyst monitor sensor (4 required)

1. For additional information, refer to the procedures in this section.

Heated Oxygen Sensor (HO2S) Printable View (33 KB)

Special Tool(s)

ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

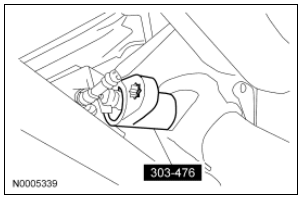
Item	Specification
Penetrating and Lock Lubricant XL-1 (Canada CXC-51-A)	
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the heated oxygen sensor (HO2S) electrical connector.
4. **NOTE:** If necessary, lubricate the HO2S with lock lubricant to aid in removal.

   Remove the HO2S from the exhaust manifold using the special tool.

   - To install, tighten to 41 Nm (30 lb-ft).



5. To install, reverse the removal procedure.
   - Apply a light coat of anti-seize lubricant to the threads of the HO2S.

Catalyst Monitor Sensor

Printable View (33 KB)

Special Tool(s)

 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

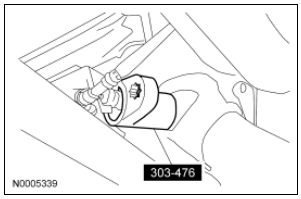
Item	Specification
Penetrating and Lock Lubricant XL-1 (Canada CXC-51-A)	
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
3. Disconnect the catalyst monitor sensor (CMS) electrical connector.
4. **NOTE:** If necessary, lubricate the CMS with lock lubricant to aid in removal.

   Using the special tool, remove the CMS from the exhaust manifold.

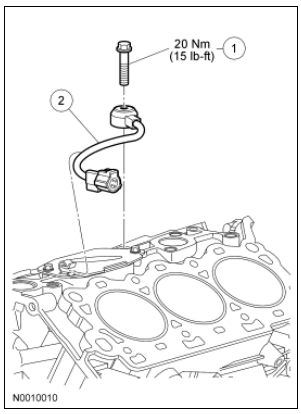
   - To install, tighten to 41 Nm (30 lb-ft).



5. To install, reverse the removal procedure.
   - Apply a light coat of anti-seize lubricant to the threads of the CMS.

Knock Sensor (KS) 3.0L (4V)

Printable View (49 KB)



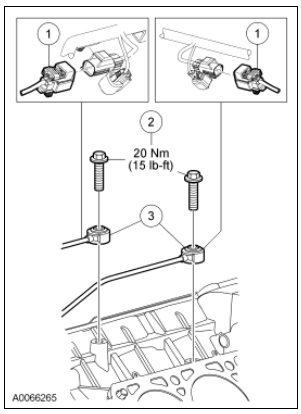
Item	Part Number	Description
1	W500310	Knock sensor (KS) bolt
2	12A699	KS

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the lower intake manifold. For additional information, refer to Section 303-01A .
3. Detach the knock sensor (KS) wiring retainer.
4. Remove the bolt and the KS.
   - To install, tighten to 20 Nm (15 lb-ft).
5. To install, reverse the removal procedure.

Knock Sensor (KS) 3.9L

Printable View (51 KB)



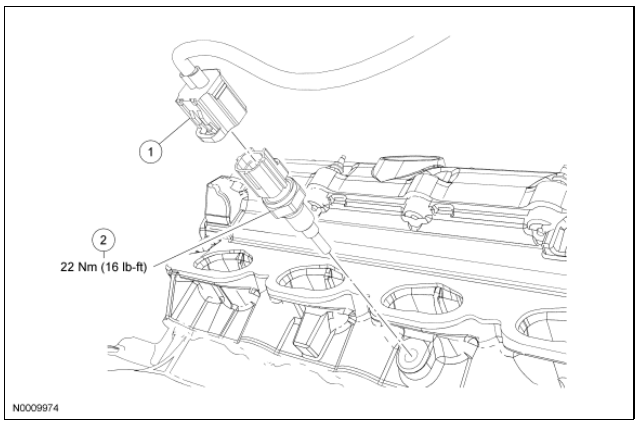
Item	Part Number	Description
1	14A464	Knock sensor (KS) electrical connector (2 required)
2	W500310	KS bolts (2 required)
3	12A699	KS (2 required)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the intake manifold. For additional information, refer to Section 303-01B .
3. Disconnect the 2 knock sensor (KS) electrical connectors.
4. Remove the 2 bolts and the 2 KS.
   - To install, tighten to 20 Nm (15 lb-ft).
5. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor 3.0L (4V)

Printable View (86 KB)



Item	Part Number	Description
1	14A464	Cylinder head temperature (CHT) sensor electrical connector
2	6G004	CHT sensor

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

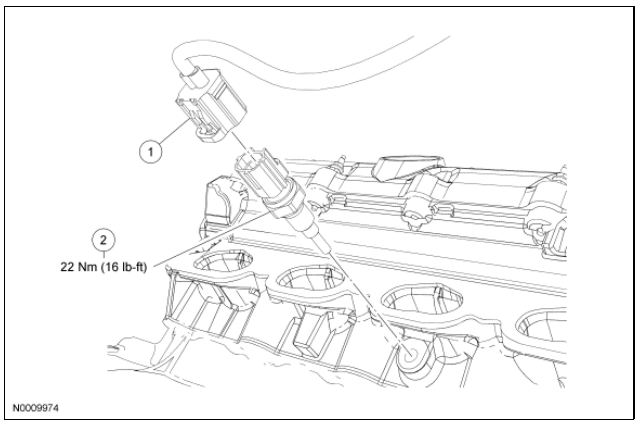
2. Disconnect the cylinder head temperature (CHT) sensor electrical connector.

3. Remove and discard the CHT.
   - To install, tighten to 22 Nm (16 lb-ft).

4. To install, reverse the removal procedure.

Cylinder Head Temperature (CHT) Sensor 3.9L

Printable View (88 KB)



Item	Part Number	Description
1		Cylinder head temperature (CHT) sensor electrical connector (part of 6G004)
2	6G004	CHT sensor

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the intake manifold. For additional information, refer to Section 303-01B .
3. Disconnect the cylinder head temperature (CHT) sensor electrical connector.
4. **NOTE:** The tip of the CHT contacts the cylinder head at the bottom of the hole. When removed, it will be slightly crushed. This is a normal condition.

   Remove and discard the CHT.

   - To install, tighten to 22 Nm (16 lb-ft).

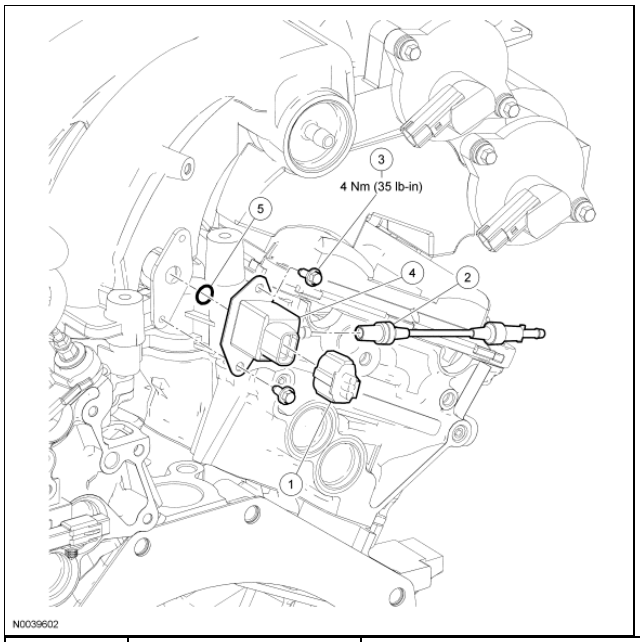
5. To install, reverse the removal procedure.
   - The CHT is not to be reused. Always install a new sensor.

Fuel Pressure Sensor 3.0L (4V)

Printable View (178 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend XO-5W20-QSP or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	14A464	Fuel pressure sensor electrical connector
2	9E499	Fuel pressure sensor vacuum tube
3	4674	Fuel pressure sensor bolts (2 required)
4	4682	Fuel pressure sensor
5		O-ring seal

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components the fuel system pressure must be relieved to prevent accidental spraying of fuel, which can cause personal injury or a fire hazard.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Release the fuel system pressure. For additional information, refer to Section 310-00 .

3. Remove the cowl vent screen. For additional information, refer to Section 501-02 .

4. Disconnect the fuel pressure sensor electrical connector and vacuum tube.

5. Remove the 2 bolts and the fuel pressure sensor.
   - To install, tighten to 4 Nm (35 lb-in).
   - Inspect the O-ring seal.

6. **NOTE:** Lubricate the O-ring seal with clean engine oil.

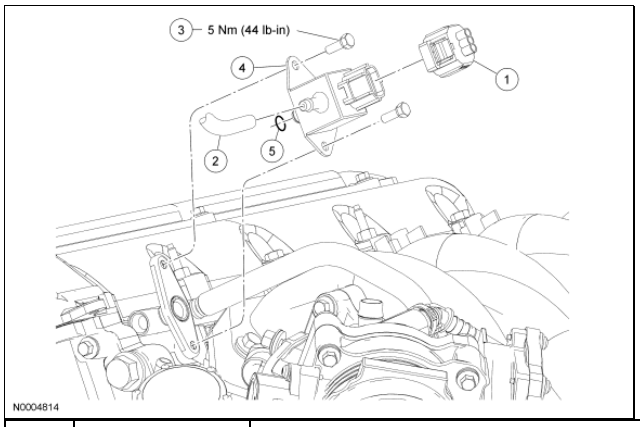
   To install, reverse the removal procedure.

Fuel Pressure Sensor 3.9L

Printable View (185 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend XO-5W20-QSP or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	14A464	Fuel pressure sensor electrical connector (part of 12B637)
2	9E499	Fuel pressure sensor vacuum tube
3		Fuel pressure sensor bolts (2 required)
4	9F972	Fuel pressure sensor
5		O-ring seal

Removal and Installation

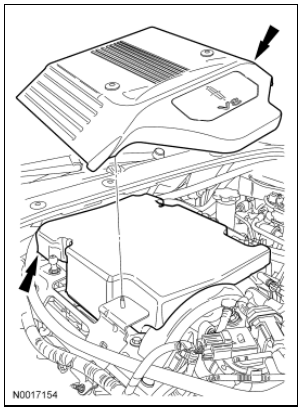
⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components the fuel system pressure must be relieved to prevent accidental spraying of fuel, which can cause personal injury or a fire hazard.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. **⚠ CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

   Remove the engine appearance cover and the noise suppressor (if detached).



3. Release the fuel system pressure. For additional information, refer to Section 310-00 .

4. Disconnect the fuel pressure sensor electrical connector and vacuum tube.

5. Remove the 2 bolts and the fuel pressure sensor.
   - To install, tighten to 5 Nm (44 lb-in).
   - Inspect and install a new O-ring seal as necessary.

6. **NOTE:** Lubricate the O-ring seal with clean engine oil.

   To install, reverse the removal procedure.

Fuel Temperature Sensor 3.0L (4V) Printable View (90 KB)

Special Tool(s)

ST1147-A	Disconnect Tool, Spring Lock Coupling (1/2 inch) 310-D004 (D87L-9280-B) or equivalent

Material

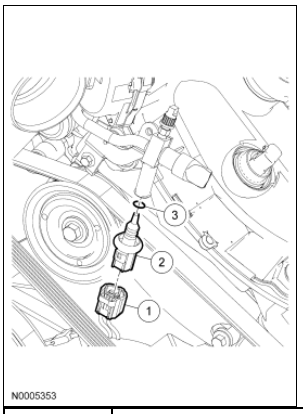
SAE 5W-20 Premium Synthetic Blend XO-5W20-QSP or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	14A464	Fuel temperature sensor electrical connector
2	4702	Fuel temperature sensor
3		O-ring seal

Removal and Installation

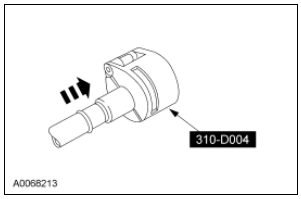
⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and can be ignited. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before working on or disconnecting any of the fuel lines or fuel system components the fuel system pressure must be relieved to prevent accidental spraying of fuel, which can cause personal injury or a fire hazard.

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Remove the air cleaner outlet tube. For additional information, refer to Section 303-12 .

4. Disconnect the fuel temperature sensor electrical connector.

5. Using the special tool, remove the fuel temperature sensor.



6. **NOTE:** Lubricate the O-ring seal with clean engine oil.

   NOTE: Align the fuel temperature sensor with the fuel tube and push together until an audible click is heard. Pull on the fittings to make sure they are fully engaged.

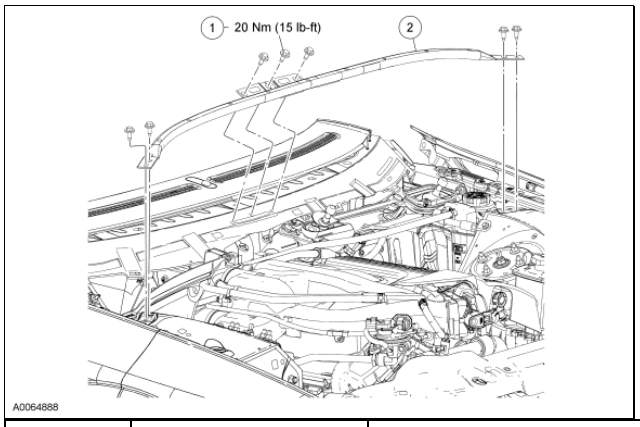
   To install, reverse the removal procedure.

Intake Manifold Tuning (IMT) Valve 3.0L (4V)

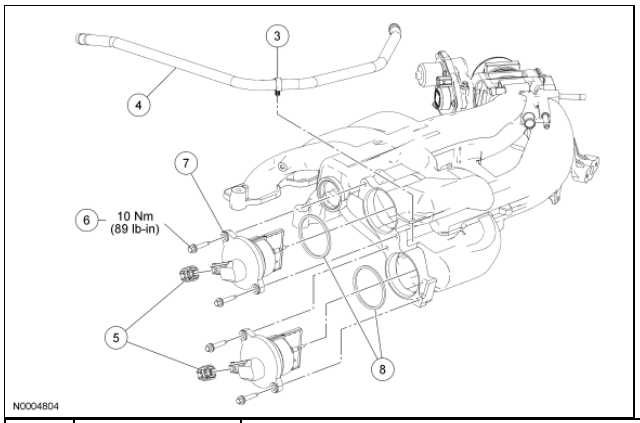
Printable View (229 KB)

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend XO-5W20-QSP or equivalent	WSS-M2C930-A



Item	Part Number	Description
1	708009	Cross-vehicle support bolts (7 required)
2	3B328	Cross-vehicle support



Item	Part Number	Description
3	13A506	Crankcase vent tube retaining clip
4	6758	Crankcase vent tube
5	14A464	Intake manifold tuning (IMT) valve electrical connectors (2 required)
6	701519	IMT valve bolts (4 required)
7	9L490	IMT valve (2 required)

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

2. Remove the cowl vent screen. For additional information, refer to Section 501-02 .

3. Remove the 7 bolts and the cross-vehicle support.
   - To install, tighten to 20 Nm (15 lb-ft).

4. Detach the crankcase vent tube pin-type retainer from the upper intake manifold.

5. Disconnect the crankcase vent tube fittings and remove the tube.

6. Disconnect the 2 intake manifold tuning (IMT) valve electrical connectors.

7. Remove the 4 IMT valve bolts and the IMT valves.
   - To install, tighten to 10 Nm (89 lb-in).
   - Inspect and install new O-ring seals as necessary.

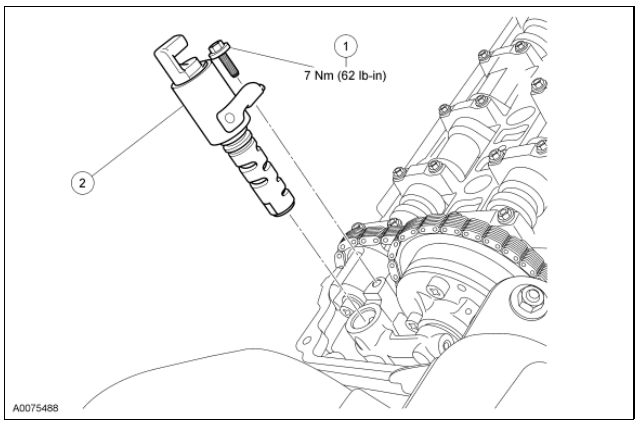
8. ⚠ **CAUTION: The IMT valve must be fully seated in the intake manifold prior to installing the bolts, or damage to the IMT valve can occur.**

   NOTE: Coat the IMT valve with clean engine oil before installing it in the intake manifold.

   To install, reverse the removal procedure.

Variable Camshaft Timing Oil Control Solenoid 3.9L

Printable View (87 KB)



Item	Part Number	Description
1	W500013	Variable camshaft timing (VCT) oil control solenoid bolt
2	6B297	VCT oil control solenoid

Removal and Installation

1. Remove the LH or RH valve cover. For additional information, refer to Section 303-01B .

2. Remove the bolt and the variable camshaft timing (VCT) oil control solenoid.
   - To install, tighten to 7 Nm (62 lb-ft).

3. To install, reverse the removal procedure.

Rear Suspension			
Toe link nut (outer)	55	41	

Toe link nut (inner)	70	52	
Toe link jam nut	55	41	

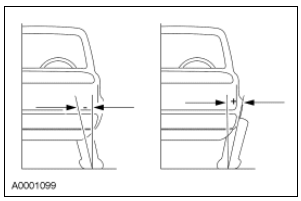
Suspension System

Printable View (101 KB)

Camber, caster and toe are adjustable on the front suspension system. Only the toe is adjustable on the rear suspension system. Camber and caster are adjusted by means of eccentric cams on the lower control arm mounting bolts. The front toe is adjusted by use of the front wheel spindle tie rod. The rear toe is adjusted by the use of toe link assemblies connecting the knuckles to the rear sub-frame.

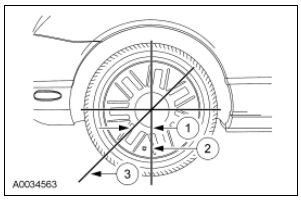
Camber

Negative and Positive Camber



Camber is the vertical tilt of the wheel when viewed from the front. Camber can be positive or negative and has a direct effect on tire wear.

Caster

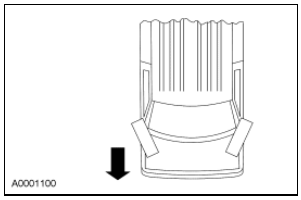


Item	Description
1	Positive caster
2	True vertical
3	Steering axis

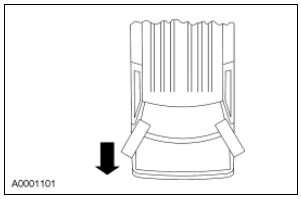
Caster is the deviation from vertical of an imaginary line drawn through the ball joints when viewed from the side. The caster specifications in this section will give the vehicle the best directional stability characteristics when loaded and driven. The caster setting is not related to tire wear.

Toe

Positive Toe (Toe-In)



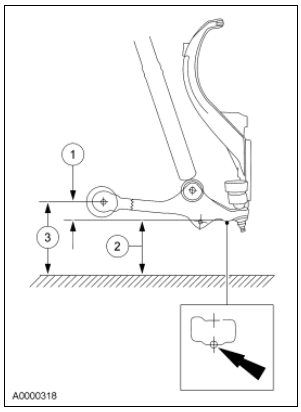
Negative Toe (Toe-Out)



The vehicle toe setting affects tire wear and directional stability.

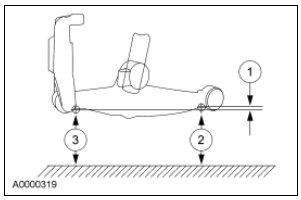
Ride Height

Front Ride Height Measurement



Item	Description
1	Ride height = B-A
2	Measurement A
3	Measurement B

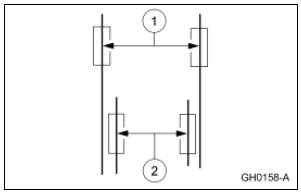
Rear Ride Height Measurement



Item	Description
1	Ride height = A-B

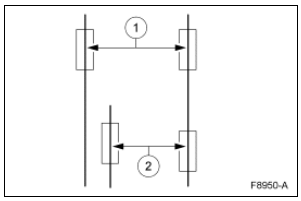
2	Measurement A
3	Measurement B

Wheel Track



Item	Part Number	Description
1		Front track
2		Rear track

Dogtracking



Item	Part Number	Description
1		Front track
2		Rear track dogtracking

Dogtracking is the condition in which the independent rear suspension (IRS) system is not square to the chassis. Heavily crowned roads can give the illusion of dogtracking.

Wander

Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Shimmy

Shimmy, as observed by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and observed by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn or the steering correction is completed.

Drift/Pull

Pull is a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, will cause a consistent deviation from the straight-ahead path and will require constant steering input in the opposite direction to counteract the effect.
- Drift/pull may be induced by conditions external to the vehicle (i.e., wind, road camber).

Poor Groove Feel

Poor groove feel is characterized by little or no buildup of turning effort felt in the steering wheel as the wheel is rocked slowly left and right within very small turns around center or straight-ahead (under 20 degrees of steering wheel turn). Efforts may be said to be "flat on center."

- Under 20 degrees of turn, most of the turning effort that builds up comes from the mesh of gear teeth in the steering gear. In this range, the steering wheel is not yet turned enough to feel the effort from the self-aligning forces at the road wheel or tire patch.
- In the diagnosis of a roadability problem, it is important to understand the difference between wander and poor groove feel.

Suspension System

Printable View (66 KB)

Inspection and Verification

1. Road test.
   - Verify the customer's concern by carrying out a road test on a smooth road. If any vibrations are apparent, refer to Section 100-04 .
2. Inspect tires.
   - Check the tire pressure with all normal loads in the vehicle and the tires cold. Refer to the vehicle certification (VC) label. For additional information, refer to Section 100-01 .
   - Verify that all tires are sized to specification. For additional information, refer to Section 204-04 .
   - Inspect the tires for incorrect wear and damage. Install new tires as necessary.
3. Inspect chassis and underbody.
   - Remove any excessive accumulation of mud, dirt or road deposits from the chassis and underbody.
4. Inspect for aftermarket equipment.
   - Check for aftermarket changes to the steering, suspension, wheel and tire components (such as competition, heavy duty, etc.) The specifications shown in this manual do not apply to vehicles equipped with aftermarket equipment.

Visual Inspection Chart

Mechanical
• Front wheel bearing(s) • Loose or damaged front or rear suspension components • Loose, damaged or missing suspension fastener(s) • Incorrect spring usage • Damaged or sagging spring(s) • Damaged or leaking shock absorber(s) • Worn or damaged suspension bushing(s) • Loose, worn or damaged steering system components • Damaged axle components

5. If an obvious cause for an observed or reported condition is found, correct the cause (if possible) before proceeding to the next step.
6. If the fault is not visually evident, determine the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Component Tests

Wheel Bearing Inspection

1. Raise the vehicle until the tires are off of the ground. For additional information, refer to Section 100-02 .

2. **NOTE:** Make sure the wheel rotates freely and the brake pads are retracted sufficiently to allow movement of the wheel and tire assembly.

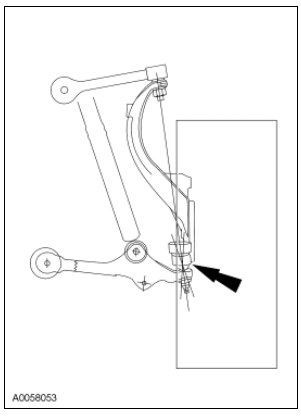
   Grasp the tire at the top and bottom and move the wheel inward and outward while lifting the weight of the tire from the front wheel bearings. If movement exists, a new wheel bearing must be installed. For additional information, refer to Section 204-01 for front suspension, or Section 204-02 for rear suspension.

Ball Joint Inspection

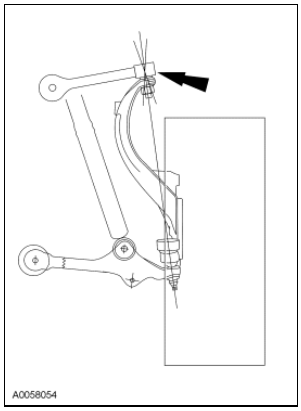
NOTE: The front suspension is shown in the following procedures. The inspection of the rear suspension upper ball joint is similar.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Prior to carrying out any inspection of the ball joints, inspect the front wheel bearings for looseness.



3. While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension lower arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new wheel knuckle as necessary. For additional information, refer to Section 204-01 .



4. While an assistant pulls and pushes the top and bottom of the tire, observe the relative movement between the ball joint and the front suspension upper arm or rear suspension upper arm. Any movement at or exceeding the specification indicates a worn or damaged ball joint. Install a new front suspension upper arm or rear suspension upper arm as necessary. For additional information, refer to Section 204-01 for front suspension, or Section 204-02 for rear suspension.

5. Lower the vehicle.

Camber and Caster Adjustment

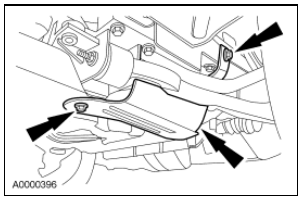
Printable View (281 KB)

NOTE: If the vehicle is equipped with hex head bolts in the lower control arm, new cam bolts and lock nuts must be installed before adjusting the cast and camber.

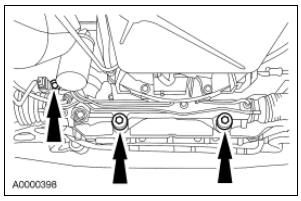
NOTE: The camber and caster adjustment for the LH side is shown. The procedure for adjusting the RH side is similar.

Vehicles without camber and caster adjustment cam bolts

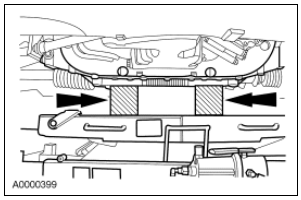
1. Remove the splash shield.
   - Remove the two splash shield bolts and a pushpin.



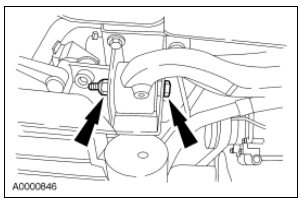
2. Remove the steering gear. Discard the lock nuts and steering gear bolts.



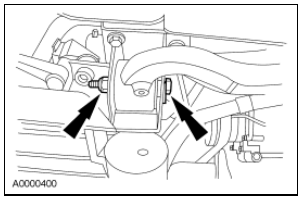
3. Raise and support the front end and the No. 2 crossmember.
   - Position two 4 in. x 4 in. pieces of wood between the No. 2 crossmember and the lifting device.



4. Remove and discard the front caster hex head bolt and nut.

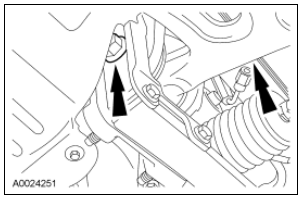


5. Loosely, install the caster adjustment cam bolt and a new lock nut.
   - The bolt must be installed from the rear as shown.
   - Install the bolt with the cam lobe down.
   - The cam must be seated between the cam guides on the No. 1 crossmember.

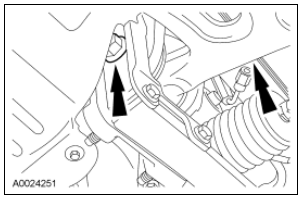


6. Position the steering gear aside.

7. Remove and discard the rear camber hex head bolt and nut.
    - Remove the I-brace bracket, if equipped.

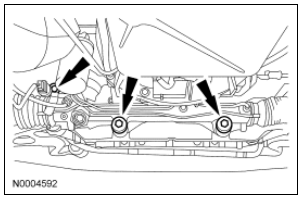


8. Loosely, install the camber adjustment cam bolt, a new lock nut and the I-brace bracket (if equipped).
    - The bolt must be installed from the rear as shown.
    - Install the bolt with the cam lobe down.
    - The cam must be seated in the groove in the No. 2 crossmember.



9. Lower the front end.

10. Install the steering gear, with new bolts and new lock nuts.
    - To install, tighten to 103 Nm (76 lb-ft).

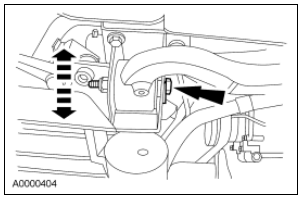


All vehicles

11. Measure the wheel alignment values.

Vehicles requiring caster adjustment

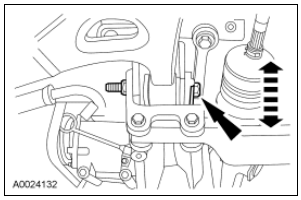
12. Rotate the caster adjustment cam bolt (front) to adjust the caster.



13. Recheck the alignment settings. Readjust as necessary.

Vehicles requiring camber adjustment

14. Rotate the camber adjustment cam bolt (rear) to adjust the camber.



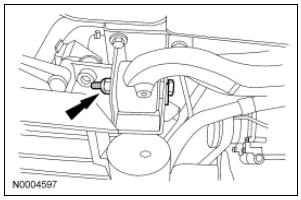
15. Repeat the above camber adjustment steps until the correct camber measurements are achieved.

All vehicles

16. ⚠ **CAUTION: Do not tighten until the weight of the vehicle is resting on the wheel and tire assemblies.**

    Tighten the caster adjustment cam nut.

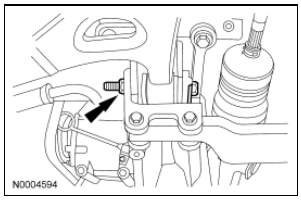
    - Tighten to 175 Nm (129 lb-ft).



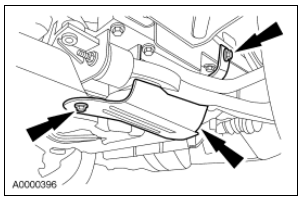
17. ⚠ **CAUTION: Do not tighten until the weight of the vehicle is resting on the wheel and tire assemblies.**

    Tighten the camber adjustment cam nut.

    - Tighten to 175 Nm (129 lb-ft).



18. Install the splash shield, one pushpin, and two bolts.



19. Check and, if necessary, adjust the front toe.

Toe Adjustment

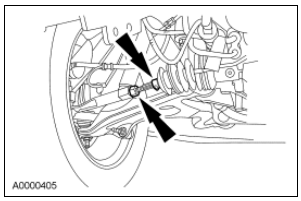
Printable View (170 KB)

Front Toe Adjustment

1. Start the engine and center the steering wheel.

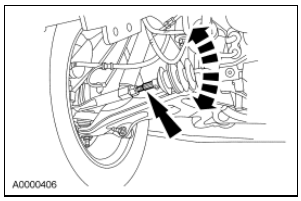
2. Turn the engine off, and hold the steering wheel in the "straight forward" position using a suitable holding device.

3. Loosen the tie-rod jam nuts and remove the steering gear bellows clamps.

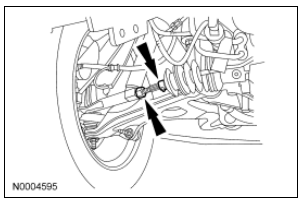


4. **NOTE:** Do not allow the steering gear bellows to twist when the front wheel spindle inner tie-rod is rotated.

   Rotate the front wheel spindle inner tie-rods.



5. Tighten the tie-rod jam nuts. Install the steering gear bellows clamps.
   - Tighten to 55 Nm (41 lb-ft).



6. Start the engine and recenter the steering wheel.
   - Recheck the toe settings and adjust if necessary.

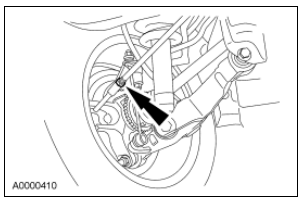
Rear Toe Adjustment

1. Start the engine and center the steering wheel.

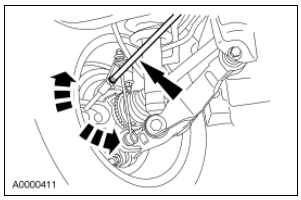
2. Turn the engine off, and hold the steering wheel in the "straight forward" position using a suitable holding device.

3. Loosen the toe link jam nut.

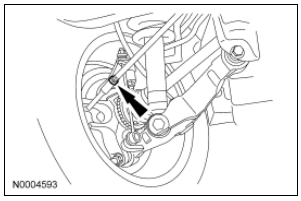
- Clean the nut and toe link threads.



4. Rotate the toe link to adjust the toe.



5. Tighten the toe link jam nut.
   - Tighten to 55 Nm (41 lb-ft).



6. Recheck the toe settings and adjust if necessary.

Front Suspension

Printable View (10 KB)

⚠ WARNING: All vehicles are equipped with gas-pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Suspension fasteners are critical parts because they can affect the performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during assembly to make sure of correct retention of these parts. Never attempt to heat, quench or straighten any front suspension part. Install a new part.

The front suspension consists of the following components:

- Front upper suspension arm and bushing
- Front lower suspension arm and bushing
- Front shock absorber and spring assembly
- Front stabilizer bar
- Front stabilizer bar bushings
- Front stabilizer bar brackets
- Front stabilizer bar links
- Front wheel knuckle
- Front wheel hub and bearing
- Front wheel studs

The front suspension camber and caster adjustment is carried out by:

- adjusting cam bolts on the lower suspension arm. For additional information, refer to Section 204-00 .

The front suspension toe adjustment is carried out by:

- adjusting the front wheel spindle inner tie rods. For additional information, refer to Section 204-00 .

Wheel Bearing and Hub

Printable View (104 KB)

Material

Item	Specification
Penetrating and Lock Lubricant XL-1	
High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A

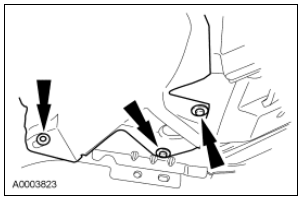
Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

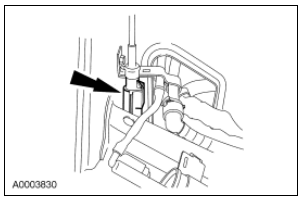
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the brake disc. For additional information, refer to Section 206-03 .

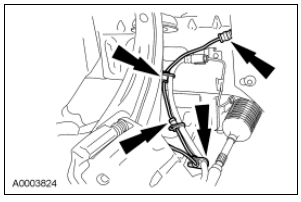
3. Remove the retainers, then position aside the inner fender skirt.



4. Move the inner fender skirt aside and disconnect the anti-lock brake (ABS) sensor.



5. Detach the ABS sensor wire from the retainers.



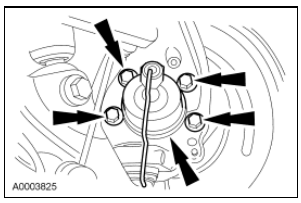
6. ⚠ **CAUTION: The wheel hub and bearing is not pressed into the wheel knuckle. Do not use a slide hammer, or strike the back of the wheel hub and bearing to remove a stuck wheel hub and bearing. Damage to the bearing or the wheel hub will occur.**

   NOTE: If necessary, clean any rust or corrosion from the back of the wheel hub and bearing and lubricate the wheel hub and bearing with Penetrating and Lock Lubricant.

   NOTE: Do not remove the ABS sensor and wire from the hub and bearing unless a new ABS sensor and wire is being installed. If the ABS sensor is separated from the hub and bearing, make sure the O-ring is in place and is not worn or damaged. Install a new O-ring if necessary.

   Remove the wheel hub-to-wheel knuckle bolts, then remove the wheel hub and bearing assembly. Discard the bolts.

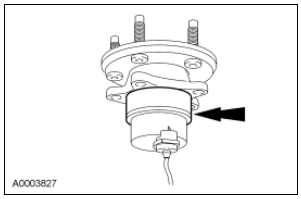
   - To install, tighten to 90 Nm (66 lb-ft).



7. ⚠ **CAUTION: The knuckle bore must be clean to allow the wheel hub and bearing to be completely seated by hand. Do not press or draw the wheel hub and bearing into place.**

   Clean and inspect the wheel knuckle bearing bore.

8. Lightly coat the surfaces of the bearing carrier and the wheel knuckle with High Temperature Nickel Anti-Seize Lubricant.



9. To install, reverse the removal procedure.

Wheel Studs

Printable View (98 KB)

Special Tool(s)

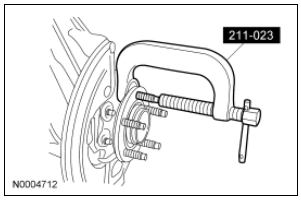
 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

Removal

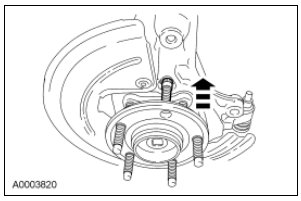
⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the front brake disc. For additional information, refer to Section 206-03 .

2. Using the special tool, press the stud from the flange.

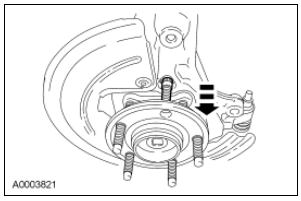


3. Line up the stud with the hole in the wheel knuckle and remove the stud.



Installation

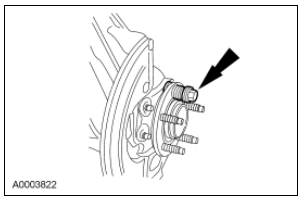
1. Insert the stud through the hole in the knuckle and into the flange, making sure the serrations on the stud line up with the serrations in the flange.



2. **⚠ CAUTION: Do not use power tools to install a wheel stud. The serrations in the flange can be stripped.**

   NOTE: Do not use the wheel nuts that came with the vehicle.

Install washers and a wheel nut on the wheel stud and tighten the nut until the stud seats against the flange. Discard the nut after use.



3. Install the front brake disc. For additional information, refer to Section 206-03 .

Lower Arm

Printable View (315 KB)

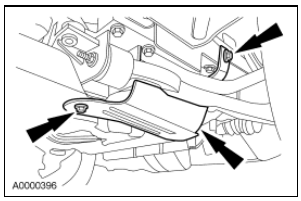
Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: New cam bolts and lock nuts must be installed whenever the lower control arm is removed.

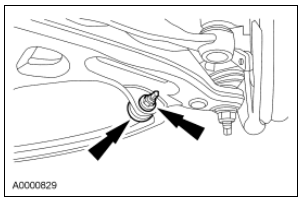
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the shield.
   - Remove the shield bolts and a push pin.

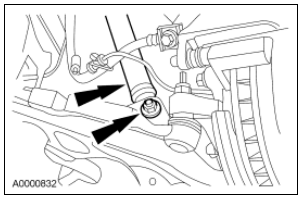


3. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

   Remove and discard the stabilizer bar link-to-lower arm nut. While prying down on the stabilizer bar, disconnect the stabilizer bar link.



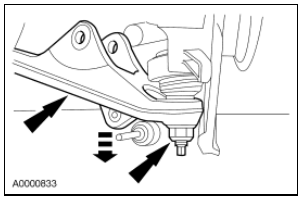
4. Remove and discard the shock absorber-to-lower arm nut and bolt. Disconnect the shock absorber and spring assembly from the lower arm.



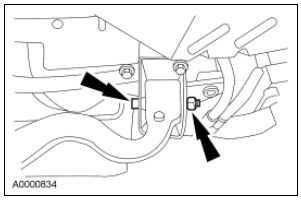
5. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

   NOTE: The tapered washer is reused with the new ball joint nut.

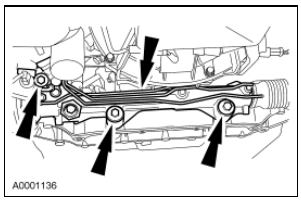
   Remove and discard the lower ball joint-to-knuckle nut. Separate the front suspension lower arm from the wheel knuckle.



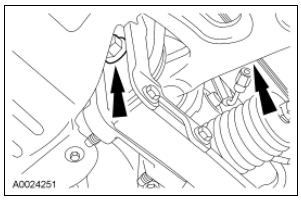
6. Remove and discard the front nut and bolt.



7. Remove the power steering gear nuts and bolts. Discard the nuts.
    - Position the power steering gear to access the lower control arm rear bolt.



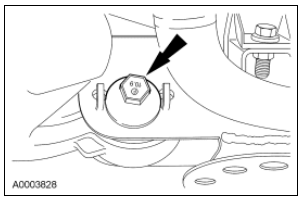
8. Remove and discard the lower control arm rear nut and bolt. Remove the front suspension lower arm.



Installation

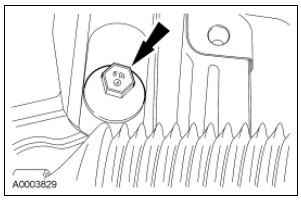
1. Position the front suspension lower arm.

2. Install a new caster adjustment cam bolt and a new nut.
    - The bolt must be installed from the rear, as shown.
    - Install the bolt with the cam lobe down.
    - The cam must be seated between the cam guides on the No. 1 crossmember.
    - The nut should only be snugged up at this time to allow for wheel alignment adjustment.
    - Final tighten the nut to 175 Nm (129 lb-ft).



3. Install a new camber adjustment cam bolt and a new nut.
    - The bolt must be installed from the rear as shown.
    - Install the bolt with the cam lobe down.
    - The cam must be seated in the groove in the No. 2 crossmember.

- The nut should only be snugged up at this time to allow for wheel alignment adjustment.
- Final tighten the nut to 175 Nm (129 lb-ft).

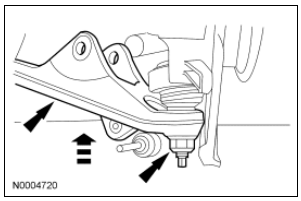


4. **NOTE:** Make sure the tapered washer is installed on the ball joint before connecting the lower control arm to the knuckle.

   NOTE: The hex holding feature can be used to prevent turning of the stud while tightening the nut.

   Connect the lower control arm to the knuckle. Install a new lower ball joint-to-knuckle nut.

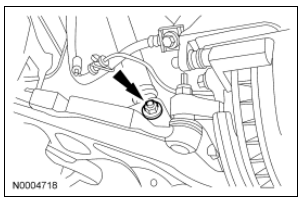
   - Tighten to 200 Nm (148 lb-ft).



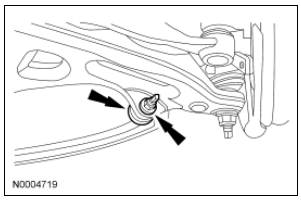
5. **NOTE:** Make sure the shock absorber lower bushing end caps are in place before installing the bolt and nut.

   Connect the shock absorber and spring assembly to the lower control arm. Install a new shock absorber-to-lower arm bolt and nut.

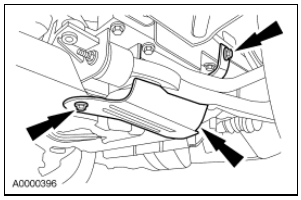
   - Tighten to 175 Nm (129 lb-ft).



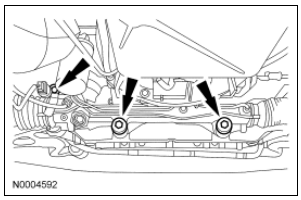
6. While prying down on the stabilizer bar, connect the stabilizer bar link to the stabilizer bar. Install a new stabilizer bar link-to-lower arm nut.
   - Install the nut until snug using the hex-head feature, then tighten the nut using a socket and a torque wrench.
   - Tighten to 55 Nm (41 lb-ft).



7. Install the shield.
   - Install the shield bolts and a push pin.



8. Position the power steering gear in place.
    - Install the power steering gear bolts and new nuts.
    - Tighten to 103 Nm (76 lb-ft).



9. Lower the vehicle.

10. Check the wheel alignment. Adjust as necessary. For additional information, refer to Section 204-00 .

Upper Arm

Printable View (342 KB)

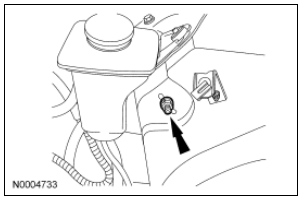
All vehicles

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

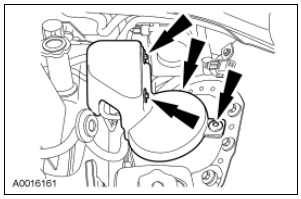
1. With the vehicle in NEUTRAL position it on a hoist. For additional information refer to Section 100-02 .

LH upper arm

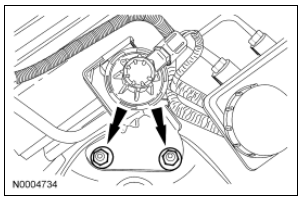
2. Remove and discard the power steering reservoir nut. Position the power steering reservoir aside.



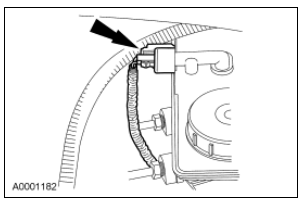
3. Remove the retainers and the left upper shock mount cover, if equipped.



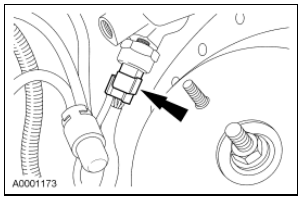
4. Remove the EVAP canister purge valve nuts and position the EVAP canister purge valve aside.
   - To install, tighten to 28 Nm (21 lb-ft).



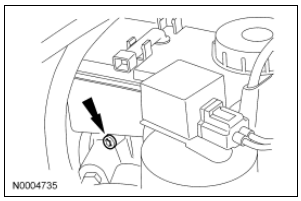
5. Disconnect the fluid level sensor connector.



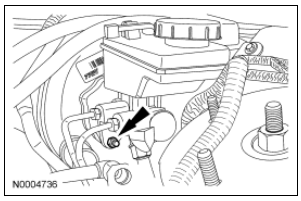
6. Disconnect the brake master cylinder main pressure transducer electrical connector, if equipped.



7. Back out the reservoir bolt to give access to the master cylinder bolt.
   - To install, tighten to 8 Nm (6 lb-ft).

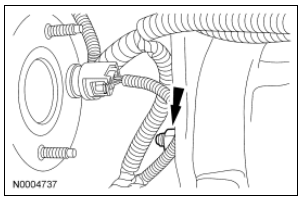


8. Remove the 2 brake master cylinder nuts and position the brake master cylinder aside.
   - To install, tighten to 25 Nm (18 lb-ft).



All vehicles

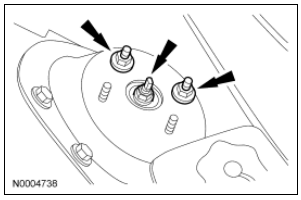
9. Remove and discard the inner and outer upper arm nuts.
   - To install, tighten to 48 Nm (35 lb-ft).



10. ⚠ **WARNING: Do not remove the center nut. This nut holds the upper spring mount in place and if this nut is removed the spring tension will be released. Failure to follow these instructions may result in personal injury.**

    Remove and discard 2 shock absorber upper mount-to-body nuts.

    - To install, tighten to 28 Nm (21 lb-ft).

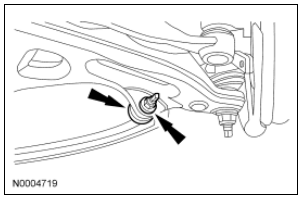


11. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

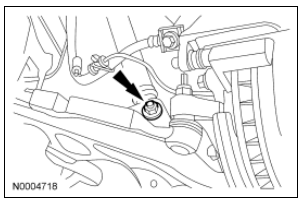
    Remove the stabilizer bar link-to-lower arm nut. While prying down on the stabilizer bar, disconnect

the stabilizer bar link from the stabilizer bar.

- To install, tighten to 55 Nm (41 lb-ft).



12. Remove and discard shock absorber lower nut and bolt, then remove the shock absorber and spring assembly.
    - To install, tighten to 175 Nm (129 lb-ft).



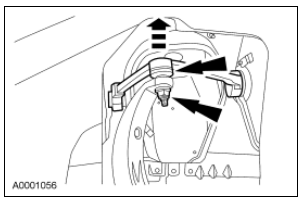
13. **NOTE:** Wire the top of the wheel knuckle to the body to prevent knuckle movement.

    NOTE: To remove the nut, first loosen the nut, then use the hex-holding feature to prevent the upper control arm ball joint from turning while removing the nut.

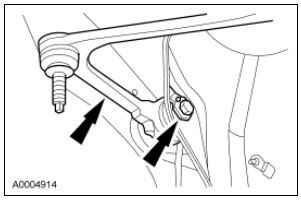
    NOTE: The tapered washer on the ball joint is reused with the new nut.

    Remove and discard the suspension upper arm nut. Disconnect the suspension upper arm from the knuckle.

    - To install, tighten to 90 Nm (66 lb-ft).



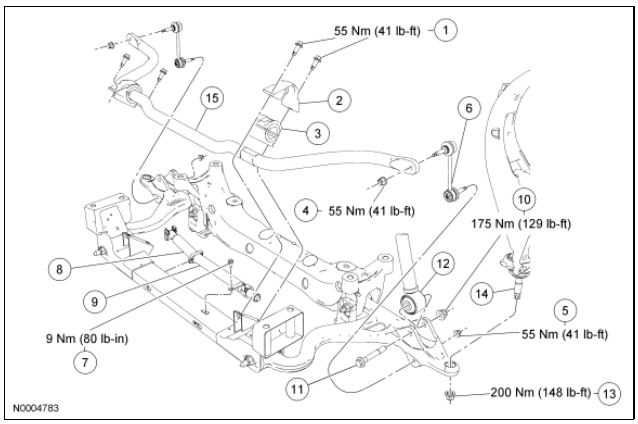
14. Remove and discard the inner and outer bolts and the suspension upper arm.
    - Remove the suspension upper arm.



15. To install, reverse the removal procedure.

Stabilizer Bar

Printable View (189 KB)



Item	Part Number	Description
1	W705457-S426	Stabilizer bar bracket-to-crossmember bolts
2	5486	Stabilizer bar-to-frame bracket
3	5493	Stabilizer bar bushing
4	N807144-S436	Stabilizer bar link-to-stabilizer bar nuts
5	W520213-S427	Stabilizer bar link-to-lower arm nuts
6	5K483	Stabilizer bar links
7	W705968-S426	Air conditioning line bracket-to-crossmember bolt
8	19D850	Air conditioning line retainer
9	19B632	Air conditioning line
10	W520215-S427	Shock absorber-to-lower arm nut
11	W705552-S426	Shock absorber-to-lower arm bolt
12	18124	LH shock absorber
13	W705518-S427	LH lower ball joint-to-lower arm nut
14		LH lower ball joint (part of 3K185)
15	5482	Stabilizer bar

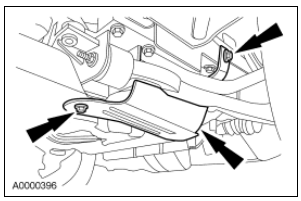
Removal and Installation

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

⚠ CAUTION: Make sure that the stabilizer bar and brackets do not make contact with the radiator or damage to the radiator can occur.

1. Remove the engine cooling fan. For additional information, refer to Section 303-12 .
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the front and left side deflector shields.



4. Remove the stabilizer bar bracket-to-crossmember bolts.
   - To install, tighten to 55 Nm (41 lb-ft).

5. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

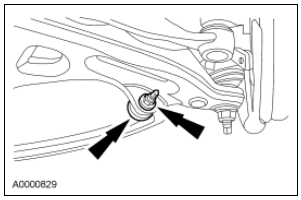
   Remove and discard the upper stabilizer bar link nuts.

   - To install, tighten to 55 Nm (41 lb-ft).

6. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

   Remove and discard the nuts, then disconnect the stabilizer bar links.

   - To install, tighten to 55 Nm (41 lb-ft).

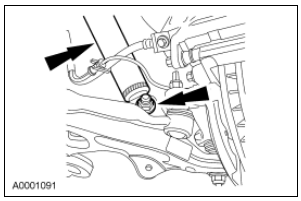


7. Remove the air conditioning line bracket-to-crossmember bolt.
   - To install, tighten to 9 Nm (7 lb-ft).

8. Disconnect the air conditioning line retainer.

9. Remove the air conditioning line. For additional information, refer to Section 412-03 .

10. Remove and discard the nut and bolt. Disconnect the left shock absorber and spring assembly.
    - To install, tighten to 175 Nm (129 lb-ft).

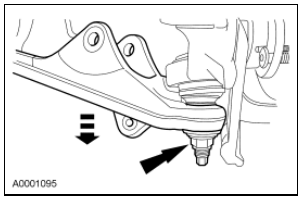


11. **NOTE:** The hex holding feature can be used to prevent turning of the stud while removing the nut.

    NOTE: The tapered washer on the ball joint is reused with the new nut.

    Remove and discard the nut. Disconnect the left suspension lower arm.

    - To install, tighten to 200 Nm (148 lb-ft).



12. **NOTE:** Deflect the LH lower control arm downward to ease removal of the stabilizer bar.

    Carefully remove the stabilizer bar through the left wheel well.

13. To install, reverse the removal procedure.

Stabilizer Bar Link

Printable View (34 KB)

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

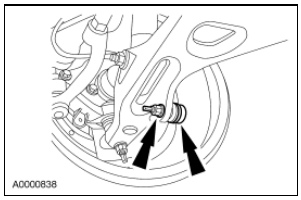
NOTE: The stabilizer bar nuts are of torque prevailing design. New nuts must be installed during assembly.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

   Remove and discard the stabilizer bar link-to-lower arm nut, then disconnect the stabilizer bar link from the suspension lower arm.

   - To install, tighten to 55 Nm (41 lb-ft).



3. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

   Remove and discard the nut from the upper stabilizer bar link, then remove the stabilizer bar link.

   - To install, tighten to 55 Nm (41 lb-ft).

4. To install, reverse the removal procedure.

Stabilizer Bar Bushing

Printable View (8 KB)

Removal and Installation

NOTE: The stabilizer bar bushing is not serviced separately. The stabilizer bar and stabilizer bar bushing are serviced as an assembly only.

For additional information, refer to Stabilizer Bar in this section.

Wheel Knuckle

Printable View (73 KB)

Removal and Installation

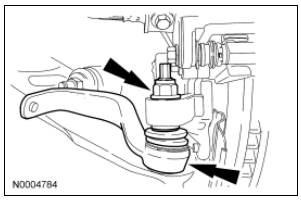
⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the wheel bearing and hub. For additional information, refer to Wheel Bearing and Hub in this section.

2. **NOTE:** The hex-holding feature can be used to prevent the stud from turning while removing the nut.

   Remove and discard the tie-rod end nut. Disconnect the tie-rod end from the wheel knuckle.

   - To install, tighten to 100 Nm (74 lb-ft).



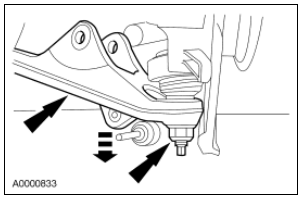
3. **⚠ CAUTION: Using a suitable jack stand, support the weight of the knuckle after disconnecting the lower control arm, or damage to the upper control arm can result.**

   NOTE: The hex-holding feature can be used to prevent turning of the stud while removing the nut.

   NOTE: The tapered washer on the ball joint is reused with the new nut.

   Remove and discard the lower ball joint-to lower arm nut, then disconnect the suspension lower arm from the knuckle.

   - To install, tighten to 200 Nm (148 lb-ft).

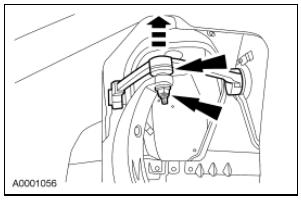


4. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

   NOTE: The tapered washer on the ball joint is reused with the new nut.

   Remove and discard the nut, then remove the knuckle.

   - To install, tighten to 90 Nm (66 lb-ft).



5. ⚠ **CAUTION: Using a suitable jack stand, support the weight of the knuckle while connecting the knuckle to the upper control arm, or damage to the upper control arm can result.**

   NOTE: The upper arm-to-knuckle nut, lower arm-to-knuckle nut and the tie-rod-to-knuckle nut are of a torque prevailing design. New nuts must be installed.

   NOTE: Make sure the tapered washer is installed on the ball joints before connecting the upper and lower control arms to the knuckle.

   To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

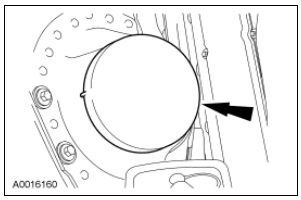
Printable View (130 KB)

Removal and Installation

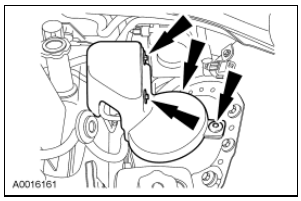
⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. If equipped, remove the right upper shock mount cover.



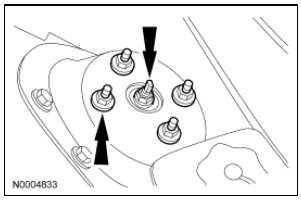
3. If equipped, remove the retainers and the left upper shock mount cover.



4. **⚠ WARNING: Do not remove the center nut. This nut holds the upper spring mount in place and if this nut is removed the spring tension will be released. Failure to follow these instructions may result in personal injury.**

   Remove and discard the shock absorber upper mount-to-body nuts.

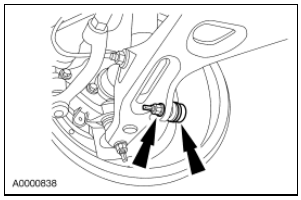
   - To install, tighten to 28 Nm (21 lb-ft).



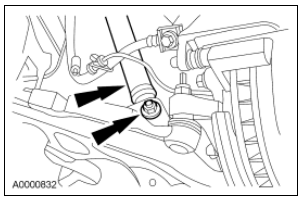
5. **NOTE:** The hex-holding feature can be used to prevent turning of the stud while removing the nut.

   Remove and discard the stabilizer bar link to-lower arm nut, then disconnect the stabilizer bar link.

   - To install, tighten to 55 Nm (41 lb-ft).



6. Remove and discard the shock absorber-to-lower arm nut and bolt, then remove the shock absorber and spring assembly.
    - To install, tighten to 175 m (129 lb-ft).



7. For additional information on the disassembly and assembly of the shock absorber and spring assembly, refer to Shock Absorber and Spring Assembly in this section.

8. ⚠ **CAUTION: Make sure the shock absorber lower bushing end caps are in place before installing the bolt and nut.**

   To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

Printable View (112 KB)

⚠ WARNING: All vehicles are equipped with gas pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions can result in personal injury.

⚠ WARNING: The shock absorber and spring assembly is under extreme load. Do not attempt to disassemble the shock absorber and spring assembly without using a spring compressor. Failure to follow these instructions can result in personal injury.

⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

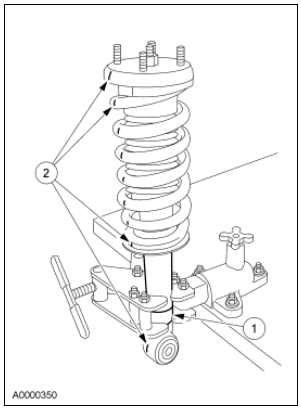
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

3. **⚠ CAUTION: Over-tightening the vise can damage the shock absorber tube.**

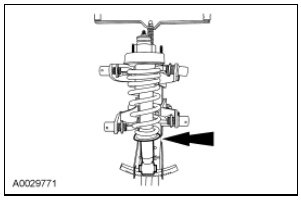
   Mount and mark the shock absorber and spring assembly.

   1. Position the shock absorber and spring assembly in a suitable holding device.
   2. Mark the upper mount, spring and shock absorber for assembly reference.

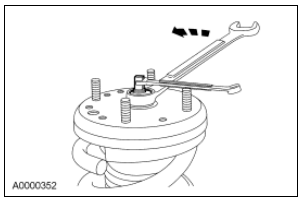


4. **NOTE:** If installing a new spring, make sure the part number is correct. Refer to the vehicle certification (VC) label for the correct spring code. Refer to Section 100-01 to convert the spring code to a part number.

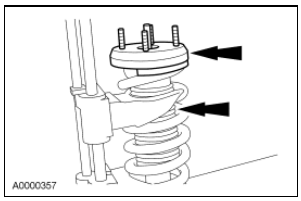
   Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.



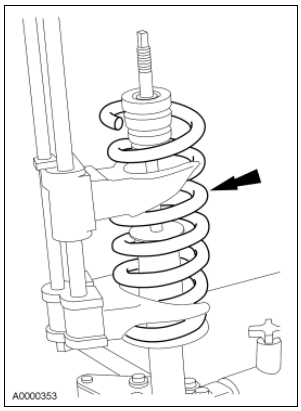
5. While holding the shock absorber rod, remove and discard the nut.
    - To install, tighten to 50 Nm (37 lb-ft).



6. Remove the upper mount and dust boot as an assembly.



7. Carefully remove the spring and spring compressor.



8. To assemble, reverse the disassembly procedure.

Printable View (11 KB)

General Specifications

Item	Specification
Motorcraft High Temperature Nickel Anti-Seize Lubricant XL-2	ESE-M12A4-A
Motorcraft Penetrating and Lock Lubricant XL-1	ESR-M99C56-A

Torque Specifications

Description	Nm	lb-ft	lb-in
Rear Suspension			
Subframe-to-body bolts	103	76	
Upper arm and bushing-to-subframe pivot bolt nuts	90	66	
Upper ball joint nut	90	66	
Lower arm and bushing-to-subframe pivot bolt and nut	150	111	
Lower arm and bushing-to-knuckle pivot bolt nut	150	111	
Toe link nut (outer)	55	41	
Toe link nut (inner)	70	52	
Stabilizer bar link nuts	48	35	
Stabilizer bar bracket bolts	55	41	
Anti-lock brake sensor bolt	10		89
Shock absorber and spring assembly-to-lower arm and bushing bolt	133	98	
Upper shock absorber rod-to-upper shock absorber mount nut	50	37	
Upper shock absorber mount-to-body nuts	28	21	
Axle shaft retaining nut	300	221	
Toe link jam nut	55	41	

Rear Suspension

Printable View (10 KB)

⚠ WARNING: All vehicles are equipped with gas-pressurized shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component servicing. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Suspension fasteners are critical parts because they can affect the performance of vital parts and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation becomes necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during assembly to make sure of correct retention of these parts. Never attempt to heat, quench or straighten any rear suspension part. Install a new part.

NOTE: The rear wheel knuckle and wheel hub is serviced as an assembly. The components are not serviced individually.

Only the toe is adjustable on the rear suspension system. The rear toe is adjusted by the use of toe link assemblies connecting the knuckles to the rear subframe.

The independent rear suspension consists of the following components:

- Rear upper suspension arm and bushing
- Rear lower suspension arm and bushing
- Rear shock absorber and spring assembly
- Rear stabilizer bar
- Rear stabilizer bar bushings
- Rear stabilizer bar brackets
- Rear stabilizer bar links
- Rear wheel knuckle / wheel hub assembly
- Rear wheel studs
- Rear toe link

1. For additional information, refer to the procedures in this section.

Wheel Hub

Printable View (7 KB)

Removal and Installation

For additional information, refer to Wheel Knuckle in this section.

Wheel Studs

Printable View (76 KB)

Special Tool(s)

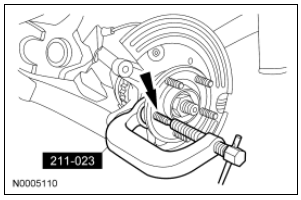
 ST1494-A	C-Frame and Screw 211-023 (T74P-3044-A1)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear brake disc. For additional information, refer to Section 206-04 .
3. **NOTE:** Cut off 1 inch of the stud to ease removal if necessary.

   Using the special tool, press the wheel stud out of the rear hub between the caliper mounting pads.

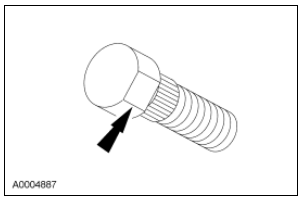
   - Discard the wheel stud. Do not reuse wheel studs.



Installation

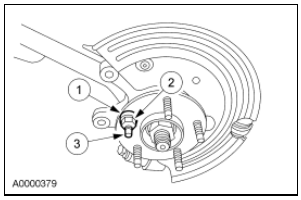
⚠ **CAUTION: Never use air tools to install wheel studs. The serrations can be stripped from the stud.**

1. If necessary, grind the head of a new wheel stud to a "D" shape to clear the wheel knuckle.



2. Position the new wheel stud into the hub flange, making sure the serrations on the stud are aligned with the serrations in the flange.
3. Install the wheel stud.
   1. Place four flat washers on the wheel stud.
   2. **NOTE:** Do not use the wheel nuts that came with the vehicle.

      Thread a standard wheel nut onto the wheel stud with the flat side against the washers.
   3. Tighten the wheel nut until the wheel stud head seats against the hub flange.



4. Remove the wheel nut and washers.

5. Install the rear brake disc. For additional information, refer to Section 206-04 .

Upper Arm

Printable View (194 KB)

Removal

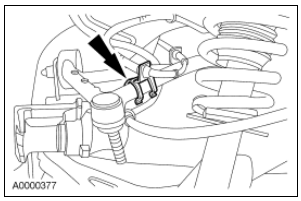
⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The suspension upper arm bushings or ball joints are not serviced separately from the upper rear suspension arm. If the bushings or ball joints require service a new suspension upper arm must be installed.

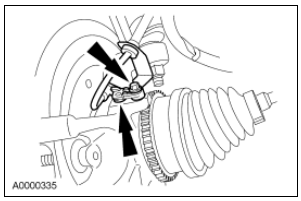
1. Remove the hub cap. Measure the distance from the center of the hub to the lip of the fender with the vehicle in a level, static ground position.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Unclip the ABS sensor wire retainer from the suspension upper arm.



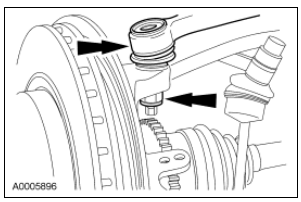
4. Remove the ABS sensor bolt and the ABS sensor. Position the sensor aside.



5. **⚠ CAUTION: Use care not to damage the anti-lock brake system (ABS) sensor ring. A damaged sensor ring will result in incorrect ABS operation.**

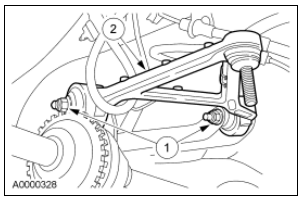
   NOTE: Use the hex holding feature to prevent the ball joint from turning while removing the nut.

   Remove and discard the upper ball joint-to-wheel knuckle nut, then disconnect the upper ball joint from the wheel knuckle.



6. Remove the suspension upper arm.

1. Remove the suspension upper arm-to-subframe nuts and bolts. Discard the nuts and bolts.
2. Remove the suspension upper arm.



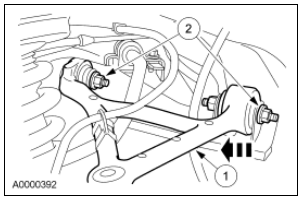
Installation

⚠ CAUTION: Do not tighten the suspension upper arm-to-subframe nuts until the suspension is at curb height. Failure to do so can cause severe damage to the bushings resulting in poor ride quality and handling.

1. **NOTE:** The bolts and nuts retaining the suspension upper arm are of a torque prevailing design. New bolts and nuts must be used.

   Install the suspension upper arm.

   1. Position the arm on the subframe.
   2. Install new suspension upper arm-to-subframe nuts and bolts. Do not tighten at this time.

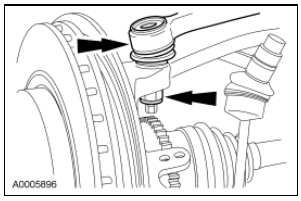


2. **⚠ CAUTION: Use care not to damage the anti-lock brake system (ABS) sensor ring. A damaged sensor ring will result in incorrect ABS operation.**

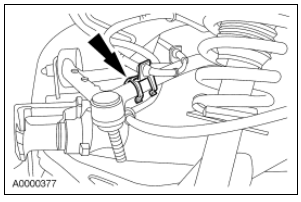
   NOTE: Install the ball joint-to-wheel knuckle nut using the hex holding feature until snug. Final tighten the nut using a line-type crow's foot and a torque wrench.

   Connect the ball joint to the wheel knuckle and hub assembly. Install a new ball joint-to-wheel knuckle nut.

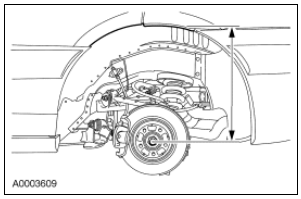
   - Tighten to 90 Nm (66 lb-ft).



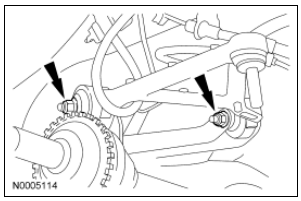
3. Clip the ABS sensor wire to the suspension upper arm.



4. Position a jack stand under the suspension lower arm and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken in Removal, Step 1.



5. Tighten the suspension upper arm nuts.
   - Tighten to 90 Nm (66 lb-ft).



6. Lower the suspension and remove the jack stand.

7. Lower the vehicle.

Lower Arm

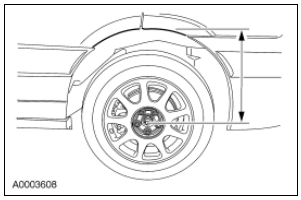
Printable View (275 KB)

Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The lower arm bushings are not serviced separately from the lower suspension arm. If the bushings require service, a new lower arm must be installed.

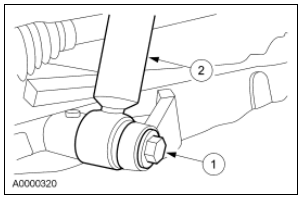
1. With the vehicle in a static, level ground position, remove the hub cap and measure the distance from the center of the hub to the lip of the fender (curb height).



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the rear brake disc. For additional information, refer to Section 206-04 .

4. Disconnect the shock absorber and spring assembly.
    1. Remove and discard the shock absorber-to-lower arm bolt.
    2. Disconnect the shock absorber and spring assembly from the lower arm.

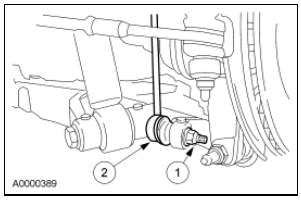


5. **⚠ CAUTION: Do not use air tools to remove the nut. Damage to the boot can result.**

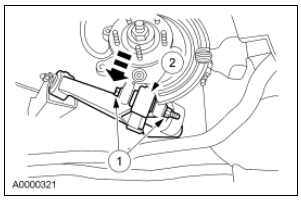
    NOTE: Use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the stabilizer bar link nut.

    Disconnect the stabilizer bar link from the suspension lower arm.

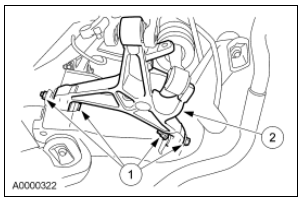
    1. Remove and discard the stabilizer bar link-to-lower arm nut.
    2. Disconnect the stabilizer bar link.



6. Disconnect the lower arm from the wheel knuckle.
    1. Remove and discard the lower arm-to-wheel knuckle bolt.
    2. Disconnect the lower arm.



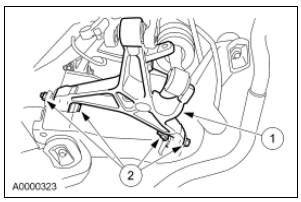
7. Remove the lower arm.
    1. Remove and discard the lower arm-to-frame bolts.
    2. Remove the lower arm.



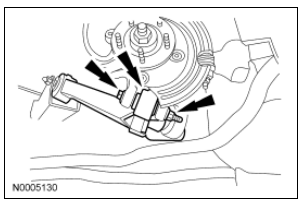
Installation

⚠ CAUTION: Do not tighten the lower arm-to-subframe fasteners until the suspension is at curb height. Failure to do so can cause severe damage to the bushings resulting in poor ride quality and handling.

1. Install the lower arm.
    1. Position the suspension lower arm onto the subframe.
    2. Install new lower arm-to-frame bolts and nuts. Do not tighten at this time.



2. Connect the lower arm to the knuckle. Install a new lower arm-to-wheel knuckle nut and bolt.
    - Tighten to 150 Nm (111 lb-ft).

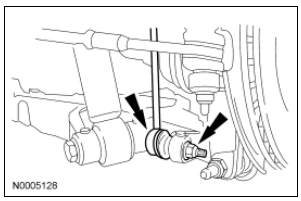


3. **⚠ CAUTION: Do not use air tools to install the nut. Damage to the boot can result.**

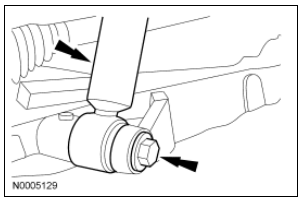
NOTE: Use the hex holding feature to prevent the stabilizer bar link ball joint from turning while installing the nut on the stabilizer bar link. Tighten the nut to specification using a socket and a torque wrench.

Connect the stabilizer bar link to the suspension lower arm. Install a new stabilizer bar link nut.

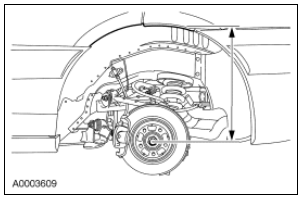
- Tighten to 48 Nm (35 lb-ft).



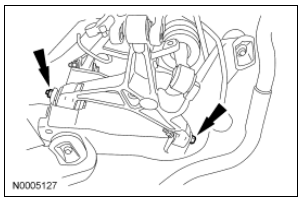
4. Position the shock absorber and spring assembly onto the suspension lower arm. Install a new shock absorber-to-lower arm bolt.
   - Tighten to 133 Nm (98 lb-ft).



5. Position a jack stand under the lower arm and raise the suspension until the measurement between the center of the hub and the lip of the fender is equal to the measurement taken in Removal, Step 1 (curb height).



6. Tighten the lower arm-to-frame rear bolt. Tighten the lower arm-to-frame front nut.
   - Tighten to 150 Nm (111 lb-ft).



7. Lower the suspension and remove the jack stand.

8. Install the rear brake disc. For additional information, refer to Section 206-04 .

9. Lower the vehicle.

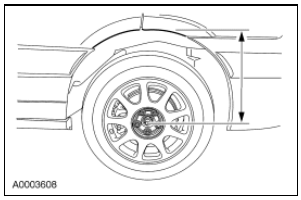
Stabilizer Bar

Printable View (365 KB)

Removal

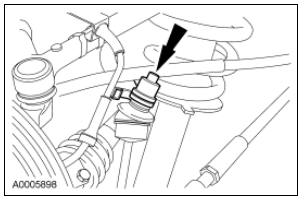
⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the hub cap and measure the distance from the center of the wheel hub to the lip of the fender with the vehicle in a static, level ground position (curb height).



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the cap from the stabilizer link.

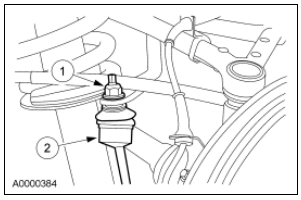


4. **⚠ CAUTION: Do not use air tools to remove the nut. Damage to the boot can occur.**

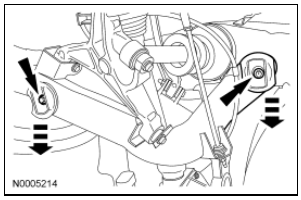
   NOTE: Use the hex holding feature to prevent the stabilizer bar link ball joint ball studs from turning when removing the stabilizer bar link nuts.

   Disconnect the rear stabilizer bar links from the rear stabilizer bar.

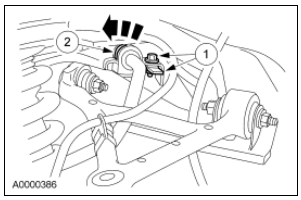
   1. Remove and discard the stabilizer bar link nuts.
   2. Disconnect the stabilizer bar links from the bar.



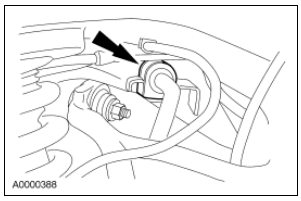
5. Lower the front of the subframe approximately 37 mm (1.48 in).
   - Using suitable jack stands, support the subframe. Remove the subframe forward bolts.



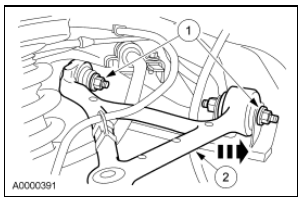
6. Remove the stabilizer bar brackets.
    1. Remove the stabilizer bar bracket bolts.
    2. Remove the stabilizer bar brackets.



7. Remove the stabilizer bar bushings.

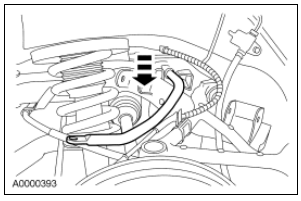


8. Disconnect the upper arms from the subframe.
    1. Remove the upper arm-to-frame bolts. Discard the upper arm-to-frame nuts and bolts.
    2. Disconnect the upper arms and rotate them out of the way.



9. **NOTE:** The stabilizer bar can be removed from either side.

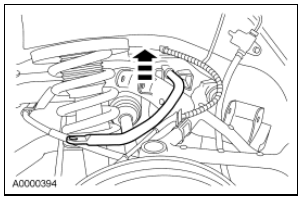
    Remove the stabilizer bar.



Installation

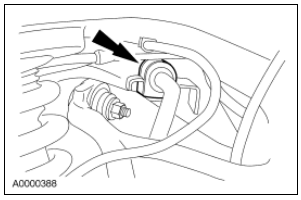
1. **NOTE:** The stabilizer bar can be installed from either side.

    Position the stabilizer bar in the vehicle.



2. **NOTE:** If the stabilizer bar bushings are badly worn or damaged, install new bushings. Do not apply grease or petroleum-based lubricants to the stabilizer bar bushing.

   Install the stabilizer bar bushings.

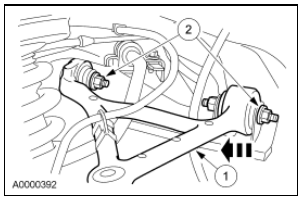


3. Install the stabilizer bar brackets.
   1. Position the brackets on the stabilizer bar bushings.
   2. Install the stabilizer bar bracket nuts and bolts.
      - Tighten to 55 Nm (41 lb-ft).

4. ⚠ **CAUTION: The upper arm must be at curb height before the nuts can be tightened. Failure to do so will result in damage to the bushings resulting in poor ride quality and handling.**

   Connect the upper arm to the subframe.

   1. Position the arm on the subframe.
   2. Install new upper arm bolts and nuts. Do not tighten the nuts at this time.



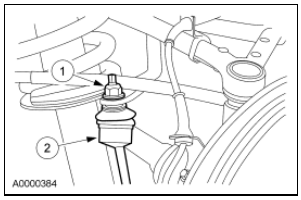
5. ⚠ **CAUTION: Do not use air tools to install the nut. Damage to the boot can occur.**

   NOTE: The nuts retaining the stabilizer bar link are of a torque prevailing design and new nuts must be used during installation of the stabilizer bar link.

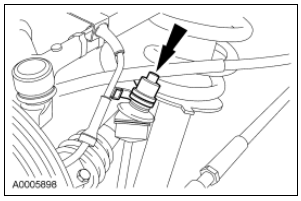
   NOTE: Use the hex holding feature to prevent the stabilizer bar link ball studs from turning when installing the stabilizer bar link ball stud nuts. Tighten the nut to specification using a socket and a torque wrench.

   Connect the stabilizer bar links to the stabilizer bar.

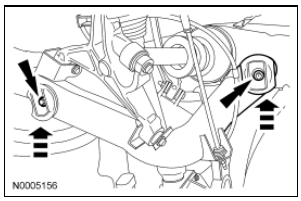
   1. Attach the stabilizer bar links to the stabilizer bar.
   2. Install new stabilizer bar link nuts.
      - Tighten to 48 Nm (35 lb-ft).



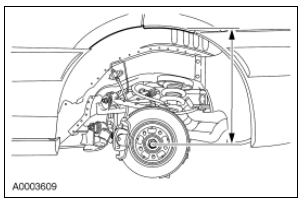
6. Install the protective cap on the stabilizer bar link.



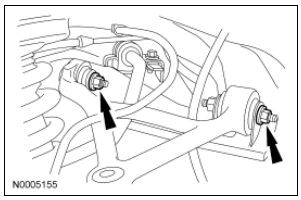
7. Install the frame-to-body bolts.
   - Tighten to 103 Nm (76 lb-ft).



8. Position jack stands under the suspension lower arm and bushings and raise the suspension until the distance between the center of the hub and the lip of the fender is equal to the measurement taken during Removal, Step 1 (curb height).



9. Tighten the upper arm-to-frame nuts.
   - Tighten to 90 Nm (66 lb-ft).



Stabilizer Bar Link

Printable View (82 KB)

Removal and Installation

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The nuts retaining the stabilizer bar link are of a torque prevailing design and new nuts must be used during installation of the stabilizer bar link.

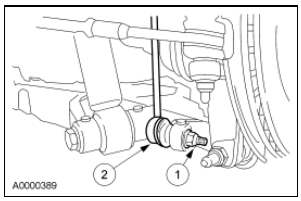
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **⚠ CAUTION: Do not use air tools to remove the nut. Damage to the boot can occur.**

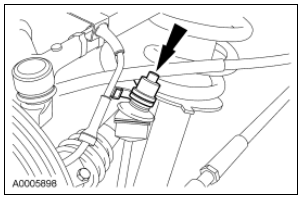
   NOTE: Use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the stabilizer bar link nut.

   Disconnect the stabilizer bar link from the lower arm.

   1. Remove and discard the stabilizer bar link nut.
      - ♦ To install, tighten to 48 Nm (35 lb-ft).
   2. Remove the stabilizer bar link from the lower arm.



3. Remove the protective cap from the stabilizer bar link.

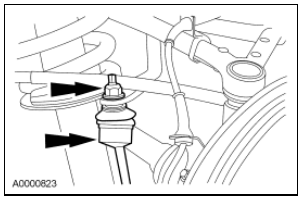


4. **⚠ CAUTION: Do not use air tools to remove the nut. Damage to the boot can occur.**

   NOTE: Use the hex holding feature to prevent the stabilizer bar link ball joint from turning while removing the stabilizer bar link nut.

   Remove the stabilizer bar link nut and the stabilizer bar link. Discard the stabilizer bar link nut.

   - To install, tighten to 48 Nm (35 lb-ft).



5. To install, reverse the removal procedure.

Toe Link

Printable View (55 KB)

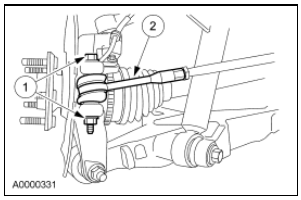
Removal

⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

NOTE: The toe link retainers are of a torque prevailing design and new bolts and nuts must be used during installation.

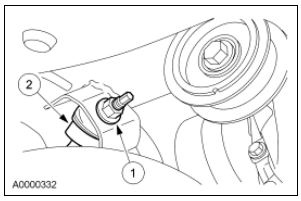
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the toe link from the wheel knuckle.
    1. Remove the toe link-to-wheel knuckle bolt.
        - ♦ Discard the nut and bolt.
        - ♦ To install, tighten to 55 Nm (41 lb-ft).
    2. Disconnect the toe link.



3. Remove the toe link from the frame.
    1. **NOTE:** Use the hex holding feature to prevent the toe link ball joint from turning while removing the nut.

       Remove and discard the toe link-to-frame nut.
    2. Remove the toe link.
        - ♦ To install, tighten to 70 Nm (52 lb-ft).



4. To install, reverse the removal procedure.

5. Check wheel alignment and adjust as necessary. For additional information, refer to Section 204-00 .

Stabilizer Bar Bushing

Printable View (92 KB)

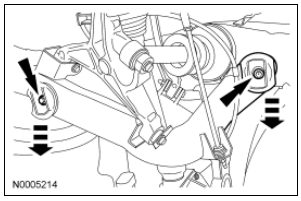
Removal and Installation

⚠ CAUTION: Suspension fasteners are critical parts because they affect the performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

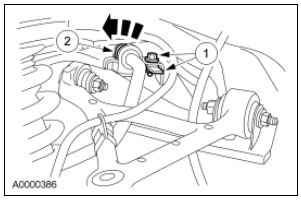
NOTE: Do not apply grease or petroleum-based lubricants to the stabilizer bar bushings.

1. With the vehicle in NEUTRAL, position it on a hoist.

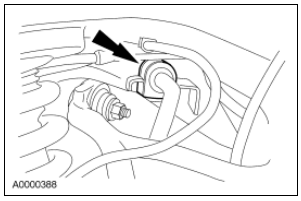
2. Lower the front of the subframe approximately 37 mm (1.48 in).
   - Using suitable jack stands, support the subframe. Remove the subframe forward bolts.



3. Remove the stabilizer bar brackets.
   1. Remove the stabilizer bar bracket bolts.
      - ♦ To install, tighten to 55 Nm (41 lb-ft).
   2. Remove the stabilizer bar brackets.



4. Remove the stabilizer bar bushing(s).



5. To install, reverse the removal procedure.

Wheel Knuckle

Special Tool(s)

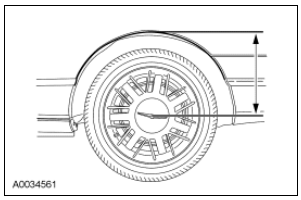
ST1516-A	Remover/Installer, Front Wheel Hub 204-069 (T81P-1104-C)
ST1517-A	Adapter, Wheel Hub 205-237 (T86P-1104-A1)
ST1518-A	Remover, Wheel Stud (Metric) 204-085 (T83P-1104-BH)

Removal

⚠ CAUTION: Suspension fasteners are important parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

⚠ CAUTION: The wheel knuckle/wheel hub is serviced as an assembly. Do not attempt to separate the wheel hub from the wheel knuckle.

1. For reference during the installation of an upper or lower arm, measure the distance between the center of the wheel hub and the lip of the fender with the weight of the vehicle resting on the wheel and tire assemblies.



A0034561

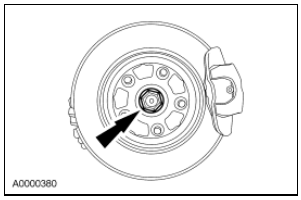
2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the rear brake disc. For additional information, refer to Section 206-04 .

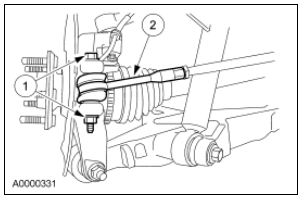
4. **⚠ CAUTION: The axle shaft retaining nut is a one time use item and a new nut must be installed when removed. Failure to do so can cause the nut to loosen during vehicle operation resulting in loss of vehicle control.**

   Remove and discard the axle shaft retaining nut.

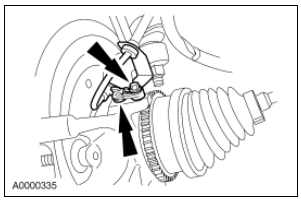
   - To install, tighten to 300 Nm (221 lb-ft).



5. Disconnect the toe link from the knuckle.
    1. Remove the toe link-to-wheel knuckle bolt. Discard the nut and bolt.
        - ♦ To install, tighten to 55 Nm (41 lb-ft).
    2. Disconnect the toe link.



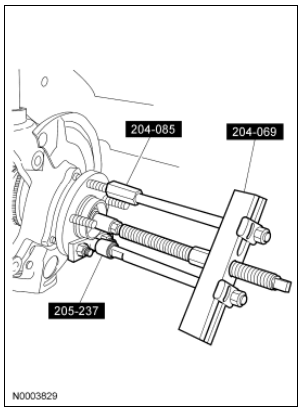
6. Remove the ABS bolt and disconnect the ABS sensor.
    - To install, tighten to 10 Nm (89 lb-in).



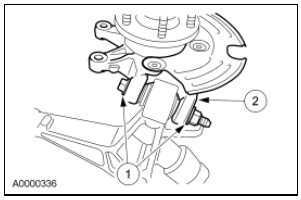
7. ⚠ **CAUTION: Support the axle shaft after removing it from the hub. Failure to do so can damage the axle shaft.**

   ⚠ **CAUTION: Do not use a hammer to separate the outboard CV joint from the hub. Damage to the threads and internal CV joint components can result.**

   Using the special tools, separate the axle shaft from the hub. Support the axle shaft.



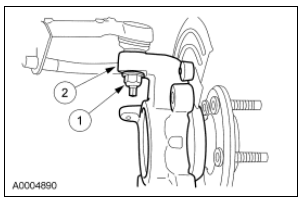
8. Disconnect the lower arm from the wheel knuckle.
    1. Remove the lower arm-to-wheel knuckle bolt. Discard the nut.
        - ♦ To install, tighten to 150 Nm (111 lb-ft).
    2. Disconnect the lower arm.



9. Remove the wheel knuckle and hub assembly.
    1. **NOTE:** Use the hex holding feature to prevent the upper arm ball joint from turning while removing the nut.

       Remove and discard the upper ball joint-to-wheel knuckle nut.

       ♦ To install, tighten to 90 Nm (66 lb-ft).
    2. Remove the wheel knuckle and hub assembly.



10. Before tightening the upper or lower suspension arm-to-frame fasteners, position a jack under the lower arm and raise the vehicle until the distance between the center of the hub and the lip of fender is equal to the measurement taken during the removal procedure.

11. To install, reverse the removal procedure.

12. Check and, if necessary, align the rear suspension. For additional information, refer to Section 204-00 .

Shock Absorber and Spring Assembly

Printable View (63 KB)

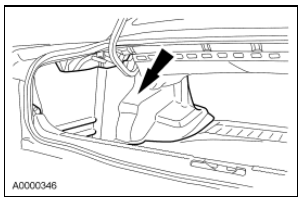
Removal and Installation

⚠ WARNING: All vehicles are equipped with gas-pressurized rear shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component service. Failure to do so may cause personal injury.

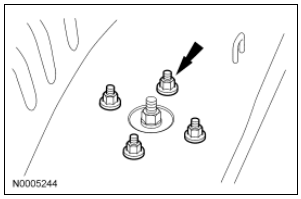
⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Open the luggage compartment lid.

2. Position the trim cover aside.

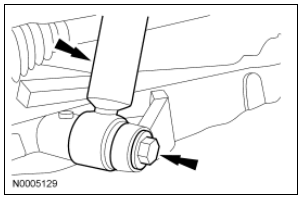


3. Remove the upper shock absorber-to-body mount nuts. Discard the nuts.
   - To install, tighten to 28 Nm (21 lb-ft).



4. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

5. Remove the shock absorber-to-lower arm bolt.
   - Discard the bolt.
   - To install, tighten to 133 Nm (98 lb-ft).



6. To install, reverse the removal procedure.

Shock Absorber and Spring Assembly

Printable View (112 KB)

⚠ WARNING: All vehicles are equipped with gas-pressurized rear shock absorbers which will extend unassisted. Do not apply heat or flame to the shock absorbers during removal or component service. Failure to do so may cause personal injury.

⚠ WARNING: The shock absorber and spring assembly is under extreme load. Do not attempt to disassemble the shock absorber and spring assembly without using a spring compressor. Failure to follow these instructions can result in personal injury.

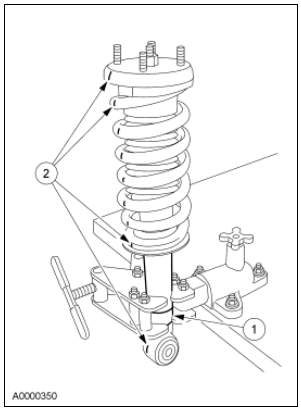
⚠ CAUTION: Suspension fasteners are critical parts because they affect performance of vital components and systems and their failure can result in major service expense. A new part with the same part number must be installed if installation is necessary. Do not use a new part of lesser quality or substitute design. Torque values must be used as specified during reassembly to make sure of correct retention of these parts.

1. Remove the shock absorber and spring assembly. For additional information, refer to Shock Absorber and Spring Assembly in this section.

2. **⚠ CAUTION: Overtightening the vise can damage the shock absorber tube.**

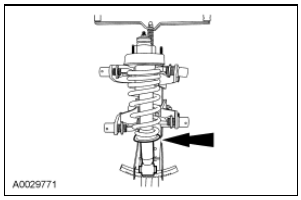
   Mount and mark the shock absorber and spring assembly.

   1. Position the shock absorber and spring assembly in a suitable holding device.
   2. Mark the upper mount, spring and shock absorber for assembly reference

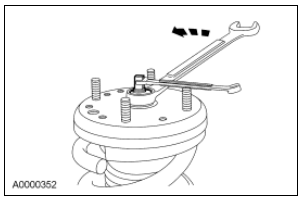


3. **NOTE:** If installing a new spring, make sure the part number is correct. Refer to the vehicle certification (VC) label for the correct spring code. Refer to Section 100-01 to convert the spring code to a part number.

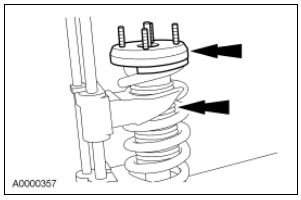
   Using a suitable spring compressor, compress the spring until the tension is released from the shock absorber.



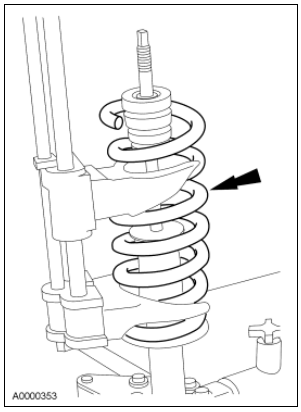
4. While holding the shock absorber rod, remove the nut.
    - To install, tighten to 50 Nm (37 lb-ft).



5. Remove the upper mount and dust boot as an assembly.



6. Carefully remove the spring and spring compressor.



7. To assemble, reverse the disassembly procedure.

Safety Precautions

Printable View (10 KB)

⚠ WARNING: Never run the engine with one wheel off the ground, for example, when changing a tire. The wheel(s) resting on the ground can cause the vehicle to move.

⚠ WARNING: The tire and wheel must always be correctly matched. It is very important to determine the size of each component before any assembly operations commence. Failure to adhere to these instructions can result in an explosive separation and cause serious bodily injury or death.

⚠ WARNING: Aftermarket aerosol tire sealants are extremely flammable. Always question the customer to make sure these products have not been used.

⚠ WARNING: Aftermarket wheel assemblies may not be compatible with the vehicle. Use of incompatible wheel assemblies can result in equipment failure and possible injury. Use only approved wheel assemblies.

⚠ WARNING: Use only wheels and wheel nuts that have been designed for current model year Ford vehicles. Aftermarket wheels or wheel nuts may not fit or function correctly, and can cause personal injury or damage the vehicle.

⚠ WARNING: Always wear safety goggles or a face shield when performing any work with tire and wheel assemblies.

⚠ CAUTION: Do not clean aluminum wheels with steel wool, abrasive-type cleaners or strong detergents. Use Custom Bright Metal Cleaner ZC-17C.

⚠ CAUTION: Reduce the air pressure as much as possible by pushing the valve core plunger in prior to removing the valve core. Avoid working in a position in which the face or body is directly over a tire in which there is pressure.

When carrying out any inspection or repair procedures on wheels and tires, follow the preceding safety precautions.

Wheels And Tires

Printable View (9 KB)

⚠ WARNING: Do not mix different types of tires, such as radial, bias or bias-belted, on the same vehicle except in emergencies (temporary spare usage). Vehicle handling can be seriously affected and can result in loss of control.

If the vehicle is equipped with uni-directional tires, mount the tires on the vehicle only in accordance with the manufacturer's instructions for direction of rotation printed on the side wall.

Original equipment uni-directional full-size spare tires can be operated with rotation counter to the directional arrow on the tire sidewall, but will perform best when rotating with the directional arrow on the sidewall.

Factory-installed tires and wheels are designed to operate satisfactorily with loads up to and including full-rated load capacity when inflated to recommended inflation pressures.

Wheels And Tires

Printable View (18 KB)

Inspection and Verification

⚠ WARNING: A vehicle equipped with a Traction-Lok® differential will always have both wheels driving. If, while the vehicle is being serviced, only one wheel is raised off the ground and the rear axle is driven by the engine, the wheel on the ground could drive the vehicle off the stand or jack. Be sure both rear wheels are off the ground.

⚠ WARNING: Do not balance the wheels and tires while they are mounted on the vehicle. Possible tire disintegration or differential failure could result, causing personal injury and extensive component damage. Use off-vehicle wheel and tire balancer only.

Be sure to follow the warnings when carrying out the inspection and verification.

Road Test

Verify the customer concern by carrying out a road test on a smooth road. If any vibrations are apparent, go to Section 100-04 .

To maximize tire performance, inspect for signs of incorrect inflation and uneven wear, which may indicate a need for balancing, rotation or front suspension alignment.

Correct tire pressure and driving techniques have an important influence on tire life. Heavy cornering, excessively rapid acceleration and unnecessary sharp braking increases tire wear.

Replacement tires must follow the recommended:

- tire sizes.
- speed rating.
- load range.
- tire construction type.

Use of any other tire size or type can seriously affect:

- ride.
- handling.
- speedometer/odometer calibration.
- vehicle ground clearance.
- tire clearance between the body and chassis.
- wheel bearing life.
- brake cooling.

New wheels need to be installed when the vehicle's wheels:

- are bent.
- are cracked.
- are dented.
- are heavily corroded.

- are leaking.
- have elongated wheel hub bolt holes.
- have excessive lateral or radial runout.

It is mandatory to use only the tire sizes recommended on the tire chart attached to the vehicle. Larger or smaller tires can damage the vehicle, affect durability, and require changing the speedometer calibration. Make sure wheel size and offsets match those recommended for the tire in use.

1. Inspect for signs of uneven wear that may indicate a need for balancing, rotation or front suspension alignment, a damaged tie-rod or damaged steering components.

2. Check tires for:
    - cuts.
    - stone bruises.
    - abrasions.
    - blisters.
    - embedded objects.

3. Tread wear indicators are molded into the bottom of the tread grooves. Install a new tire when the indicator bands become visible.

Symptom Chart

Symptom Chart

Wheel Leaks

Printable View (10 KB)

Material

Item	Specification
Metal Surface Cleaner ZC-21	WSE-M5B392-A
Aluminum Wheel Repair Compound	ESA-M4G280-A

⚠ WARNING: Wheel repairs that use welding or peening are not approved. An inner tube is not an acceptable repair for leaking wheels or tires.

If the air pressure in a tire mounted on an aluminum wheel is found to be low, carry out the following procedure before considering installation of a new wheel.

1. Remove the wheel and tire assembly and inspect the wheel for structural damage. If none exists, go to Step 2. If the wheel is damaged, install a new wheel.

2. With the tire mounted on the wheel, locate the air leak using a water bath or equivalent method, and mark the location. Check the complete wheel for possible additional leaks. When the leaks are marked, dismount the tire, marking valve location on the tire for correct indexing.

3. On the tire side of the wheel, thoroughly clean the leaking area with an appropriate cleaner (Metal Surface Cleaner ZC-21 or equivalent meeting Ford specification WSE-M5B392-A) or use sandpaper of approximately 80-grit to remove all contamination. Using the sandpaper, score the surface of the leaking area to improve adhesion of the sealer. If the valve stem is close to the area, remove it.

4. Use a clean cloth to remove all cleaner and sanding dust.

5. **NOTE:** Do not use a torch containing oxyacetylene.

   Heat the prepared area with a Heat Gun or a propane torch. Apply Aluminum Wheel Repair Compound meeting Ford specification ESA-M4G280-A or equivalent over the prepared area using a liberal flow and wiping action. Repair is most effective when heat is applied to the brake side of the rim, and the sealer is melted by heat in the metal.

6. Apply only enough heat to melt the sealer, then remove the heat source. After repairing the leak, allow the wheel to cool until it can be handled safely.

7. **⚠ CAUTION: Use caution when mounting the tire so as not to damage the sealer.**

   Index and assemble the wheel and tire. Inflate the tire to the recommended pressure as indicated on the tire pressure decal.

8. Repeat Step 2 to verify repair.

9. When the repair is completed, balance the assembly and install it on the vehicle.

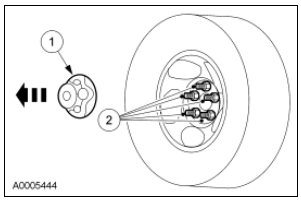
Wheel and Tire Printable View (58 KB)

Removal

1. ⚠ **CAUTION: Do not use heat to loosen a seized wheel nut. Heat can damage the wheel and wheel bearings.**

   Loosen the wheel nuts.

   1. Remove the hub cap.
   2. With the weight of the vehicle on the tires, loosen the wheel nuts.



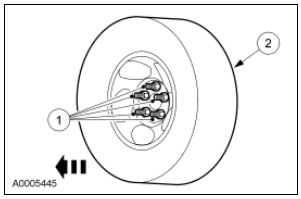
2. ⚠ **CAUTION: Never use the differential housing as a lifting point.**

   Raise and support the vehicle. For additional information, refer to Section 100-02 .

3. ⚠ **CAUTION: Do not use heat to loosen a seized wheel because heat can damage the wheel and the wheel bearings. If the wheel cannot be removed by hand, use a wheel puller to remove the seized wheel.**

   Remove the wheel and tire assembly.

   1. Remove the wheel nuts.
   2. Remove the wheel and tire assembly, using a side-to-side rocking motion.



Installation

1. ⚠ **WARNING: When a wheel is installed, always remove any corrosion, dirt or foreign material present on the mounting surfaces of the wheel and the surface of the wheel hub, brake drum or brake disc that contacts the wheel. Installing wheels without correct metal-to-metal contact at the wheel mounting surfaces can cause the wheel nuts to loosen and the wheel to come off while the vehicle is in motion, causing loss of control.**

   NOTE: If there is significant corrosion of the nut or stud threads, lubricate the threads with a drop of oil prior to installation.

   NOTE: When the wheel nuts are used to attach the mini-spare, and are correctly installed, the cone seat of the nut body will be in contact with the cone seat of the wheel. The washer on the nut will not

be in contact with the wheel and will spin freely.

Clean the wheel and the wheel hub mounting surface.

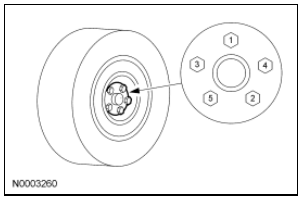
2. Install the wheel and tire assembly.
    1. Position the wheel and tire assembly.
    2. Install the wheel nuts hand-tight, then lower the vehicle.

3. **⚠ WARNING: Retighten at 80 km (50 miles) after any wheel change or any time the wheel nuts are loosened. Failure to retighten the wheel nuts at the mileage specified could allow the wheels to come off while the vehicle is in motion, possibly causing loss of control.**

   ⚠ CAUTION: Failure to tighten the wheel nuts in a star pattern can result in high brake disc runout, which will speed up the development of brake roughness, shudder and vibration.

   Tighten the wheel nuts to specification in a star-pattern sequence.

   - Tighten to 135 Nm (100 lb-ft).



Printable View (7 KB)

Driveline Operating Angles

Front Flex Coupler Operating Angle (deg.)	Rear Flex Coupler Operating Angle (deg.)	Center Support U-joint Operating Angle (deg.)
0°-1°	0°-1°	-4°-1°

Axle Lubricants and Capacities

Lubricant	Specification	Capacity
High Performance Rear Axle Lubricant XY-75W40-QL	WSL-M2C192-A	1.25 liters (2.6 pints)

Driveline System

Printable View (47 KB)

The drivetrain's power is generated by the engine and delivered to the transmission. The driveline transfers the engine torque through the driveshaft to the axle.

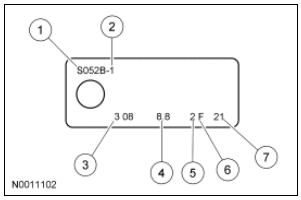
The driveshaft is connected to the output shaft flange on the transmission and to the axle pinion flange. Flex couplers and alignment bushings are used at the ends of the driveshaft to allow for any angular motion. The 2-piece driveshaft has a slip spline, the spline connects the driveshaft halves and is supported by a center bearing. Engine torque enters the axle through the drive pinion, which rotates the ring gear. The ring gear is mounted to the differential case, which contains the gears that transmit power to the axle halfshafts. The differential case is retained by two differential carrier bearings. There is one differential bearing cap, while the right carrier bearing is enclosed by the differential housing. A selective snap ring is used instead of shims on the right side of the differential housing. The axle halfshafts rotate the drive wheels.

The engine angle is built into the engine mounts. If the flex coupler operating angles are out of specification, the engine mounts must be inspected for damage.

Vehicle Certification (VC) Label Example

The vehicle certification (VC) label is located in the driver door jamb. The first 2 digits of the axle code indicate the axle and ratio. For additional information on the VC label, refer to Section 100-01 .

A metal axle identification tag is attached to the differential by a housing cover bolt.



Item	Description
1	Plant code
2	Denotes interchangeability affected internally
3	Axle ratio
4	Ring gear diameter (inch)
5	Build year

6	Build month
7	Build day

⚠ CAUTION: The axle identification tag is the official service identifier. Do not damage the tag. Always reinstall the tag after removing it for axle inspection/repair.

The axle identification tag identifies a particular axle design and a specific ratio. In addition, the plant code will not change as long as that particular axle assembly never undergoes an external design change. If, however, an internal design change takes place during the production life of the axle and that internal change affects parts interchangeability, a dash and numerical suffix is added to the plant code. This means that as an assembly both axles are interchangeable; however, internally they are different. Therefore, each requires different internal parts at the time of repair.

Driveline System

Printable View (7 KB)

For driveline information, refer to Section 100-04 .

For rear axle information, Refer to the appropriate section in Group 205 for the procedure.

For front axle information, Refer to the appropriate section in Group 205 for the procedure.

Driveshaft

Printable View (9 KB)

⚠ CAUTION: All driveshaft assemblies are balanced. If undercoating the vehicle, protect the driveshaft to prevent overspray of any undercoating material.

The driveshaft is a 2-piece design. A single center U-joint and a slip yoke connect the driveshaft assemblies. The front and rear shafts are separable at the slip yoke. It is imperative to index-mark the assemblies before separation to prevent an imbalance condition. The driveshaft uses flex couplings at each end of the shaft that take the place of traditional U-joints. The driveshaft has alignment bushings at each end of the shaft. These bushings align the driveshaft with the pilot stems on the transmission output shaft and the axle drive pinion stem. Only remove the flex couplings from the driveshaft if it is necessary to install new flex couplings/alignment bushings. Always install a new alignment bushing and flex coupling as a pair.

The driveshaft has traditional balance weights attached (spot-welded) by the manufacturer. The final driveshaft balance occurs, with the complete drivetrain assembly at vehicle assembly, by attaching weighted color-coded nuts to the axle flex coupling bolts. For this reason, the rear flex coupling bolts are longer than the front transmission flex coupling bolts. Always install the driveshaft flex coupling bolts with the head of the bolt seated against the flange, and the nuts seated against the flex coupling.

Driveshaft

Printable View (7 KB)

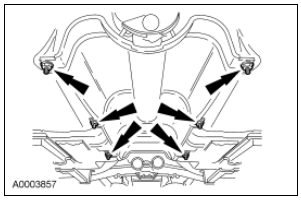
Refer to Section 205-00 .

Driveshaft Runout and Balancing

Printable View (117 KB)

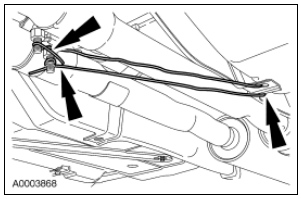
1. With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

2. Remove the bolts retaining the heat shield to the vehicle.



3. **WARNING: Personal injury can result if the heat shield contacts the driveshaft during the balancing procedure. Secure the heat shield away from the driveshaft.**

   Move the heat shield forward and secure it with a wire.



4. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

5. **WARNING: Reinstall and tighten the wheel nuts to prevent them from coming loose during the balancing procedure and causing personal injury.**

   Install and tighten the wheel nuts. For additional information, refer to Section 204-04 .

6. Open the hood to provide additional cooling.

7. Turn off the traction control, if so equipped.

8. Have an assistant get in the driver seat.

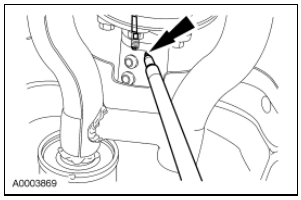
9. **CAUTION: Do not exceed 70 mph.**

   Have the assistant accelerate to the speed where the imbalance is most noticeable.

10. **WARNING: Keep hands, hair, head and clothing clear of rotating parts and hot exhaust components.**

    NOTE: The marker will contact the heavy side of the rotating driveshaft.

    Insert a suitable marker into a 305-mm (12-inch) long piece of plastic pipe. Using the heat shield lip as a brace, slowly move the scribe towards the driveshaft, in an area clear of the balance weld weights, until it lightly contacts and marks the driveshaft.



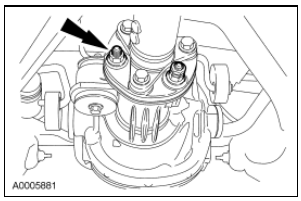
11. Have the assistant stop accelerating and shut off the engine.

12. With the driveshaft stationary, observe the mark on the driveshaft. A partial mark (less than 360 degrees) indicates the presence of an imbalance. A 360-degree mark indicates that there is no imbalance or that the pressure applied to the marker was too great. Proceed as follows if the mark indicates an imbalance. Otherwise, reinstall all components.

13. Locate the bolt in the flex coupling opposite the mark. Install a 1.23-gram (red) weighted nut onto this bolt. This is the light side of the driveshaft. Refer to the following chart for balance nut weight and color code information.

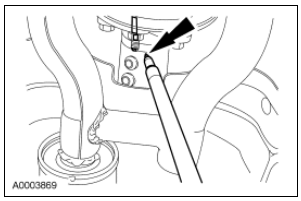
    Balance Nuts

Kit Part Number	Color	Weight (grams)
XW4Z-4613-AA	Red	1.23
	Silver	2.75
	Green	5.6
	Black	4.0



14. ⚠ **WARNING: Keep hands, hair, head and clothing clear of rotating parts and hot exhaust components.**

    Repeat the marking procedure.

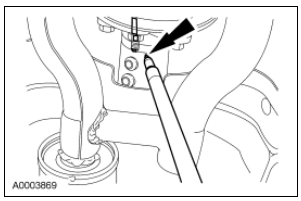


15. Have the assistant stop accelerating and shut off the engine.

16. With the driveshaft stationary, observe the mark on the driveshaft. If the new mark is 360 degrees, reinstall all components and road test the vehicle. If the vibration is still present, remove the 1.23-gram (red) weighted nut, install a 2.75-gram (silver) weighted nut in its place, and proceed as follows.

17. ⚠ **WARNING: Keep hands, hair, head and clothing clear of rotating parts and hot exhaust components.**

Repeat the marking procedure.



18. Have the assistant stop accelerating and shut off the engine.

19. With the driveshaft stationary, observe the mark on the driveshaft. If the new mark is 360 degrees, reinstall all components and road test the vehicle. If the vibration is reduced, move the weighted nut to the adjacent bolts and repeat the marking procedure. If the condition does not improve, install a new driveshaft assembly. Retest using the marker and weighted nuts as necessary. When the best possible condition is met, reinstall all components and road test the vehicle.

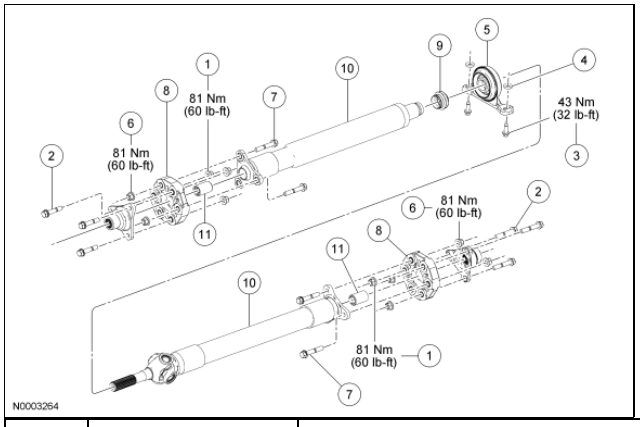
Material

Item	Specification
Premium Long-Life Grease XG-1-C or equivalent	ESA-M1C75-B
Threadlock 262 TA-26	WSK-M2G351-A6



Item	Part Number	Description
1	W705575-S301	Flex coupling-to-flange bolt nuts (3 required)
2	W705098-S301	Flex coupling-to-flange bolts (3 required)
3	N897487-S56	Center support bearing bolts (2 required)
4		Center support adjusting washer (selective)
5	4A499	Center bearing and bracket assembly
6	W705575-S301	Flex coupling-to-driveshaft bolt nuts (3 required)
7	W705098-S301	Flex coupling-to-driveshaft bolts (3 required)
8	4782	Flex coupling (2 required)
9	4421	Driveshaft slip yoke boot
10	4602	Driveshaft assembly
11	4650	Alignment bushing (2 required)

Removal

1. ⚠ **CAUTION: Only remove the flex couplings from the driveshaft if it is necessary to install new flex coupling/alignment bushings. Install new alignment bushings and flex couplings as a pair. Balance the driveshaft with the flex couplings installed.**

   With the vehicle in NEUTRAL, position on a hoist. For additional information, refer to Section 100-02 .

2. Remove the muffler and extension pipe assembly. For additional information, refer to Section 309-00 .

3. Remove the heat shield.

4. ⚠ **CAUTION: To make sure assembly is in the exact same location, index-mark the bolt, nut, washer, flex coupling and pinion flange with paint or marker. Using a different color paint or marker, index-mark the 2nd bolt, nut and washer that retain the driveshaft and flex coupling to the pinion flange and the transmission flange. Do not index-mark the 3rd bolt, nut and washer that retain the driveshaft and flex coupling to the pinion flange. These fasteners are balance weights. Always assemble them in their original positions. Failure to do so can cause a driveshaft NVH concern.**

   Index-mark the components.

5. ⚠ **CAUTION: Do not remove the flex coupling-to-driveshaft bolts.**

   NOTE: The bolt heads are serrated. Hold the bolt and loosen the nut.

   Remove the 3 flex coupling-to-flange bolt nuts and flex coupling-to-flange bolts.

6. ⚠ **CAUTION: Do not remove the flex coupling-to-driveshaft bolts.**

   NOTE: The bolt heads are serrated. Hold the bolt and loosen the nut.

   Remove the 3 flex coupling-to-flange bolt nuts and flex coupling-to-flange bolts.

7. **NOTE:** Index-mark the driveshaft on both sides of the slip joint.

   Slide the front shaft assembly rearward.

8. Remove the center support bearing bolts, then the driveshaft assembly.

Installation

1. Add 1 gram of grease to both alignment bushing cavities.

2. ⚠ **CAUTION: Align the index marks or a driveshaft NVH concern can occur.**

   Align the index marks and position the alignment bushing on the pinion flange piloting stem.

3. ⚠ **CAUTION: Install the selective spacers and bolts in their original positions.**

   NOTE: Do not tighten the bolts at this time.

   Install the center support bearing bolts hand-tight.

4. Slide the front shaft assembly forward.

5. ⚠ **CAUTION: Align the index marks or driveshaft NVH can occur.**

   Align the index marks and position the alignment bushing on the transmission flange piloting stem.

6. ⚠ **CAUTION: Install the bolts, washers and nuts in their original positions or a driveshaft NVH concern can occur. Install the driveshaft flex coupling bolts with the head of the bolt seated against the flange, and the nuts seated against the flex coupling. Install the short bolts in the transmission flange and the long bolts in the drive pinion flange.**

NOTE: The bolt heads are serrated. Hold the bolt and tighten the nut.

Install all 6 of the flex coupling-to-flange bolt nuts and flex coupling-to-flange bolts.

- Coat the nut and bolt threads with Threadlock 262.
- Tighten to 81 Nm (60 lb-ft).

7. ⚠ **CAUTION: Tighten the center support bearing bolts evenly to avoid twisting the bracket.**

   Tighten the center support bearing bolts.

   - Tighten to 43 Nm (32 lb-ft).

8. Install the heat shield.

9. Install the muffler and extension pipe assembly. For additional information, refer to Section 309-00 .

Driveshaft Alignment Bushing

Printable View (112 KB)

Special Tool(s)

ST1144-A	Universal Puller Set 303-DS005 (D80L-100A) or equivalent
ST2454-A	Driveshaft Alignment Bushing Remover Tube 205-D073 or equivalent
ST1255-A	Adapter For 303-224 205-153 (T80T-4000-W)
ST1508-A	Driveshaft Alignment Bushing Installer 205-D074 or equivalent

Material

Item	Specification
Threadlock 262 TA-26	WSK-M2G351-A6
Premium Long-Life Grease XG-1-C	ESA-M1C75-B

Disassembly

1. Remove the driveshaft. For additional information, refer to Driveshaft in this section.

2. Separate the front driveshaft from the rear shaft.

3. **NOTE:** The bolt heads are serrated. Hold the bolt and loosen the nut.

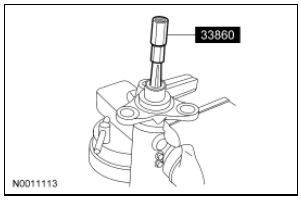
   Index-mark and remove the flex coupling-to-driveshaft bolt nuts, the flex coupling-to-driveshaft bolts and the flex coupling.

   - Discard the flex coupling. Retain the flex coupling-to-driveshaft bolt nuts and flex coupling-to-driveshaft bolts.

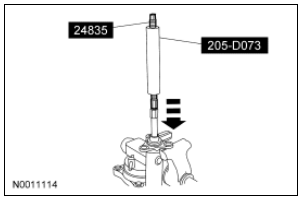
4. ⚠ **CAUTION: Do not clamp the vise on the driveshaft tube as a fracture can result.**

   Position the driveshaft end yoke in the vise jaws.

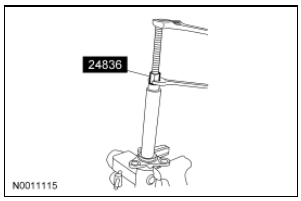
5. Insert the special tool inside the alignment bushing and expand the collet.



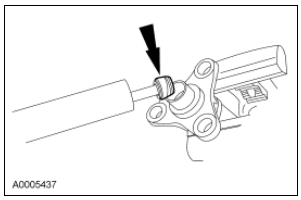
6. Install the special tools.



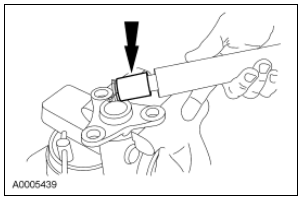
7. Hold the forcing screw and tighten the forcing screw nut until the alignment bushing inner core is removed.



8. Discard the alignment bushing inner core.



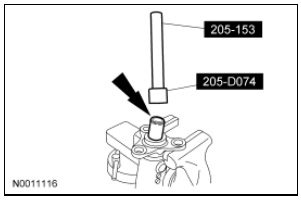
9. Insert the special tool and expand the collet to seat behind the bushing shell.
10. Install the special tools.
11. Hold the forcing screw and tighten the forcing screw nut until the alignment bushing outer shell is removed.
12. Discard the alignment bushing outer shell.



Assembly

1. **NOTE:** Install the alignment bushing with the seal facing outboard.

   Using the special tools, align the bushing with the driveshaft.



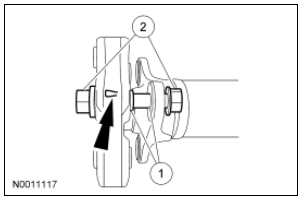
2. Using the special tools, drive the alignment bushing until the tool contacts the end yoke face.

3. ⚠ **CAUTION: There are 6 bushings in each flex coupling. Three of the bushings protrude from one side of the flex coupling and 3 protrude from the other side. The arrows on the side of the flex coupling point toward the protruding end of the bushing. When installing the flex coupling, the protruding end of the bushing must seat in the driveshaft flange counterbore or damage will occur to the flex coupling during driveshaft operation.**

   Install the flex coupling.

   1. Position the protruding end of the bushing against the driveshaft flange.
   2. ⚠ **CAUTION: The bolt heads must seat against the driveshaft flange and the nuts against the flex coupling.**

      Install the flex coupling-to-driveshaft bolt nuts and flex coupling-to-driveshaft bolts in their original locations.



4. **NOTE:** The bolt heads are serrated. Hold the bolt and tighten the nut.

   Tighten the flex coupling-to-driveshaft bolt nuts and flex coupling-to-driveshaft bolts.

   - Coat the bolt threads with Threadlock 262.
   - Tighten to 81 Nm (60 lb-ft).

5. Repeat for the other end of the driveshaft.

6. ⚠ **CAUTION: Align the index marks or driveshaft imbalance can occur.**

   Assemble the front driveshaft to the rear shaft.

7. ⚠ **CAUTION: Add 1 gram of grease to both alignment bushing cavities before installing the driveshaft.**

   Install the driveshaft. For additional information, refer to Driveshaft in this section.

Driveshaft Center Bearing

Printable View (76 KB)

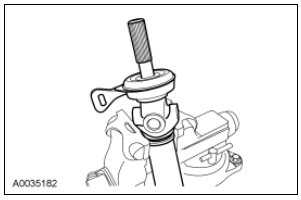
Special Tool(s)

 ST1260-A	2-Jaw Puller 205-D026 (D80L-1002-L) or equivalent
ST1368-A	Puller, Bearing 205-D064 (D84L-1123-A) or equivalent
ST2454-A	Driveshaft Alignment Bushing Remover Tube 205-D073 or equivalent

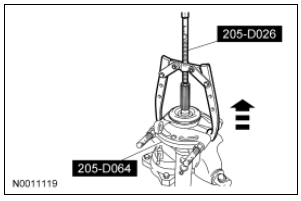
Disassembly

1. Remove the driveshaft. For additional information, refer to Driveshaft in this section.
2. Separate the front driveshaft from the rear shaft.
3. ⚠ **CAUTION: Do not clamp on the driveshaft tube as a fracture can result.**

   Position and clamp the driveshaft at the weld yoke.

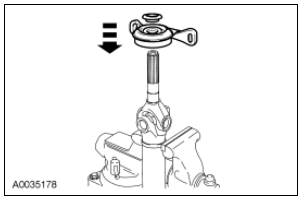


4. Using the special tools, remove the retaining ring and the center bearing and bracket assembly.

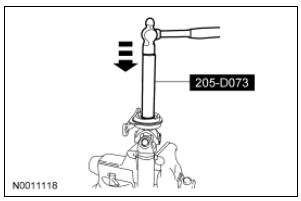


Assembly

1. Position the center bearing and bracket assembly and the retaining ring on the yoke.



2. Using the special tool, drive the retaining ring and bearing assembly until fully seated on the yoke.



3. Assemble the front and rear shaft assemblies.

4. Install the driveshaft. For additional information, refer to Driveshaft in this section.

Rear Drive Axle and Differential

Printable View (8 KB)

The rear axle assembly contains the following features:

- An integral-type housing hypoid gear design which has the centerline of pinion set below the centerline of ring gear.
- A hypoid ring gear and pinion, consists of a 203-mm (8.0-inch) diameter ring gear and an overhung drive pinion which is supported by 2 opposed tapered roller bearings.
- Pinion bearing preload is maintained by a drive pinion collapsible spacer on the pinion shaft and adjusted by the pinion nut.
- A rear axle housing assembly which consists of a differential carrier and a cast-aluminum rear differential housing cover.
- A differential housing cover which uses silicone sealant rather than a gasket.
- A differential case which is a 1-piece design with 2 openings to allow for assembly of internal components and lubricant flow.
- A differential pinion shaft which is retained by a threaded differential pinion shaft lock bolt assembled to the differential case.
- A differential case which is mounted in the rear axle housing between 2 opposed differential bearings.
- Differential bearings which are retained in the rear axle housing by 1 removable bearing cap.
- Differential bearing preload and ring gear backlash which are adjusted by differential bearing shims located between the differential bearing cup and the rear differential housing.
- The use of a pinion depth gauge is required for correct differential ring gear and pinion adjustment.
- The halfshafts are held in the differential case by a circlip that is located on the inboard CV joint stub shaft. When each halfshaft is installed, the circlip engages a groove in the differential side gear.

The rear drive axle operates as follows:

- The rear axle drive pinion receives power from the engine through the transmission and driveshaft.
- The pinion gear rotates the ring gear, which is bolted to the differential case outer flange.
- Inside the differential case, 2 differential pinion gears are mounted on a differential pinion shaft which is pinned to the differential case.
- These differential pinion gears are meshed with the differential side gears to which the halfshafts are splined.
- As the differential case turns, it rotates the halfshafts.
- When it is necessary for 1 wheel and halfshaft to rotate faster than the other, the faster turning differential side gear causes the differential pinion gears to roll on the slower turning differential side gear. This allows differential action between the 2 halfshafts.

Inspection and Verification

The technician should have a thorough knowledge of driveline system operation and accepted general driveline guidelines to detect any problems.

A gear driven unit will produce a certain amount of noise. Some noise is acceptable and audible at certain speeds or under various driving conditions. Certain conditions, such as road conditions and weather, will amplify normal vehicle noise.

Certain rear axle and driveline concern symptoms are also common to the engine, transmission, rear wheel bearings and tire. For this reason, be sure the cause of the concern is in the axle before repairing or installing any axle components.

The following is a guide to diagnose a driveline concern:

- Verify and document the customer concern.
- Perform a preliminary investigation.
- Road test the vehicle.
- Find the cause of the problem.
- Inspect the components.

1. Verify and document the customer concern.
    1. When was it first noticed?
    2. Did it appear suddenly or gradually?
    3. Did anything unusual occur that would coincide with it or precede it?
    4. Has the driveline system been repaired before or new components installed?
        - Check the vehicle service record. Note any repairs other than driveline, such as brakes or suspension.
    5. Are there any special conditions affecting the concern or will alter the concern? For example,
        - road speed
        - type of road
        - drive mode
        - temperature
        - vehicle loaded or unloaded
    6. Is the condition constant or intermittent? Can the concern be duplicated at any time?
    7. Check for TSBs, SSM and OASIS messages.

2. **NOTE:** If the inspection reveals an obvious concern, repair the vehicle.

   Do a preliminary investigation. Visually inspect for obvious signs of damage.

1. Inspect the driveshaft:
    - ♦ for build up of any foreign material.
    - ♦ for damage, such as a bent tube or missing weights.
    - ♦ U-joints or flex couplers for wear or damage.
2. Inspect the axle:
    - ♦ for signs of leakage at the drain or fill plug, differential seal, vent or halfshaft seals.
        - ♦ a plugged vent or vent tube will cause a leak.
    - ♦ for damage, such as cracks, bent halfshafts or dented rear cover.
    - ♦ for missing fasteners.
3. Inspect other suspect components/systems:
    - ♦ inspect the halfshaft assemblies for damaged CV joints or torn CV boots
    - ♦ inspect the suspension for broken springs, damaged shock absorbers and worn suspension bushings.
    - ♦ inspect the rear brake components lines, cables and calipers.
    - ♦ inspect the tires; are they in good condition and do they match?

3. **NOTE:** A road test is necessary for any customer concern of noise or vibration.

   Road test the vehicle.

    1. During the road test, use the following driving methods to diagnose the problem. Is the concern most noticeable:
        - ♦ from a stop?
        - ♦ on shifts from REVERSE to DRIVE?
        - ♦ on turns?
            - ♦ sweeping type turn.
            - ♦ tight turn (to the stop).
        - ♦ in DRIVE?
            - ♦ accelerating the vehicle, definite throttle depression, applying engine torque?
        - ♦ in CRUISE?
            - ♦ maintain a constant speed with the throttle applied?
        - ♦ in COAST?
            - ♦ decelerating with the throttle closed?
    2. Record when the concern occurs. Write down the kph (mph) range at which the noise/vibration occurs.

4. Find the cause of the problem.
    1. Compare the inspection and road test results with the following chart.
    2. Use the following diagnostic routine chart to identify the probable cause and know what corrective actions should be taken to repair the component/vehicle, and to prevent a reoccurrence.

       Diagnostic Routine Chart

Condition	Action
· Fluid loss	· GO to Diagnostic Routine Fluid Loss
· Noise louder on turns (sweeping turn)	· GO to Diagnostic Routine Noise Louder On Turns (Sweeping)
· Axle noise (growl) [a] in tight turn	· GO to Diagnostic Routine Noise (Growl) In Tight Turn
· Axle noise (chatter/shudder) [a] in tight turn, limited slip differential	· GO to Diagnostic Routine Noise (Chatter/Shudder) In Tight Turns, Limited Slip Differential

· Axle noise (whine) [a] in all or more than one drive mode	· GO to Diagnostic Routine Noise (Whine) In All Or More Than One Drive Modes
· Axle noise (tick/click) [a] in all or more than one drive mode (drive, cruise, coast)	· GO to Diagnostic Routine Noise (Tick/Click) In All Or More Than One Drive Modes
· Axle noise (howl/moan) [a] in all or more than one drive mode (drive, cruise, coast)	· GO to Diagnostic Routine Noise (Howl/Moan) In All Or More Than One Drive Modes
· Axle noise (clunk) [a] on changes in speed or direction of power	· GO to Diagnostic Routine Noise (Clunk) On Changes In Speed Or Direction Of Power
· Vibration	· For additional information on driveline vibration diagnostics, REFER to Section 100-04 .

a. Refer to Section 100-04 for a glossary of noise-related terms.

5. **NOTE:** If the conclusion of the road test points to an axle center section (ring and pinion or differential case) concern, carry out a visual inspection of the rear axle.

   Inspect the axle components.

   1. Remove the axle assembly.
   2. Remove the differential housing cover. Drain the axle lubricant through a white cloth. Check the fluid for:
      - ♦ any foreign material.
      - ♦ metal particles.
      - ♦ burnt odor.
   3. **NOTE:** When inspecting the axle, do not clean the components immediately. Cleaning may remove diagnostic evidence.

      Inspect the axle components.

      - ♦ Look for:
        - ♦ loose fasteners.
        - ♦ notches or visible steps or grooves created by wear.
        - ♦ pitting or cracking along gear contact lines.
        - ♦ scuffing or deformations.
        - ♦ discolorations.
        - ♦ nicks or ridges on gear teeth.
      - ♦ Clean the axle components for inspection.
        - ♦ Remove as much lubricant as possible with clean solvent. Wipe the components or blow them dry with compressed air.
      - ♦ Re-inspect for:
        - ♦ loose fasteners.
        - ♦ notches or visible steps or grooves created by wear.
        - ♦ pitting or cracking along gear contact lines.
        - ♦ scuffing or deformations.
        - ♦ discolorations.
        - ♦ nicks or ridges on gear teeth.
      - ♦ Check backlash and carry out a ring and pinion pattern test. Refer to Checking Differential Ring Gear Backlash and Checking Tooth Contact Pattern and Condition of the Ring and Pinion in this section.

Diagnostic Routines

Diagnostic Routine Fluid Loss

Possible Component	Reference/Action
· Vent	· CLEAN the axle vent and vent hose.
· Overfilled axle	· CHECK the lubricant level for specific amount.
· Fill plug	· CLEAN the area around the plug. REMOVE the plug. APPLY pipe sealant and INSTALL the plug.
· Halfshaft oil seal	· INSTALL a new halfshaft oil seal.
· Pinion seal	· INSTALL a new pinion seal.
· Differential housing cover	· RESEAL the differential housing cover.

Diagnostic Routine Noise Louder on Turns (Sweeping)

Possible Component	Reference/Action
· Wheel end bearing	· CHECK the wheel end bearing for wear or damage. INSTALL a new bearing.

Diagnostic Routine Noise (Growl) In Tight Turn, Conventional Differential

Possible Component	Reference/Action
· Differential side gears and differential pinion gears	· Disassemble the differential carrier. INSPECT the differential case assembly. INSTALL new side gears and differential pinion gears or case assembly.

Diagnostic Routine Noise (Chatter/Shudder) In Tight Turns, Limited Slip Differential

Possible Component	Reference/Action
· Clutch pack	· VERIFY the condition. With the vehicle in cold startup, MAKE SURE that the vehicle is in 2WD, to isolate the rear axle. TURN the wheel fully right (or fully left) and then ACCELERATE the vehicle. If the condition is verified to be in the rear axle, REMOVE and INSTALL new clutch packs.

Diagnostic Routine Noise (Whine) In All Or More Than One Drive Modes

Possible Component	Reference/Action
· Axle ring and pinion	· REMOVE and INSTALL a new ring gear, pinion and bearings.

Diagnostic Routine Noise (Tick/Click) In All Or More Than One Drive Modes

Possible Component	Reference/Action
· Axle ring and pinion	· REMOVE and INSTALL a new ring gear, pinion and bearings.

Diagnostic Routine Noise (Howl/Moan) In All Or More Than One Drive Modes

Possible Component	Reference/Action
· Axle bearings	· INSPECT differential and pinion bearings. INSTALL new bearings.

Diagnostic Routine Noise (Clunk) On Changes In Speed Or Direction Of Power

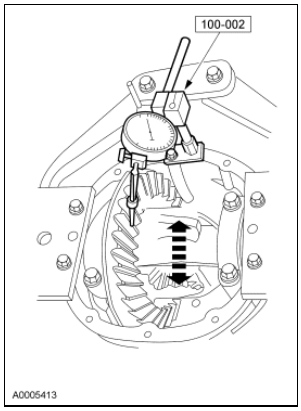
Possible Component	Reference/Action
· Axle and Pinion System	· Measure total backlash. If end play and total backlash are within specification, INSTALL a new differential case assembly.
· Differential pinion shaft	· INSTALL a new differential pinion shaft and pin.
· Pinion Bearings	· INSTALL new pinion and differential bearings and bearing cups.

Diagnostic Routine Vibration

Possible Component	Reference/Action
· For additional information on driveline vibration, REFER to Section 100-04 .	

Checking Differential Ring Gear Backlash

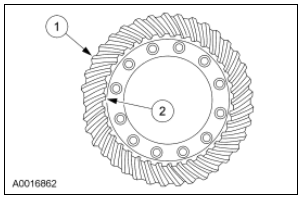
1. Remove the differential assembly.
2. Remove the differential housing cover.
3. Secure the differential assembly in a fixture.
4. Using a suitable dial indicator and the special tool, measure and record the differential ring gear backlash in 4 opposing points on the ring gear.



Checking Tooth Contact Pattern and Condition of the Ring and Pinion

There are 2 basic types of conditions that will produce ring and pinion noise. The first type is a howl or chuckle produced by broken, cracked, chipped, scored or forcibly damaged gear teeth and is usually quite audible over the entire speed range. The second type of ring and pinion noise pertains to the mesh pattern of the gear pattern. This gear noise can be recognized as it produces a constant pitch or whine. Ring and pinion noise tends to peak in a narrow speed range or ranges, and will tend to remain constant in pitch.

NOTE: In the following steps, the movement of the contact pattern along the length is indicated as toward the "heel" or "toe" of the differential ring gear.



Item	Description
1	Heel
2	Toe

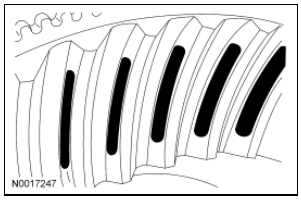
Apply a marking compound to a third of the gear teeth on the differential ring gear. Rotate the differential ring gear several complete turns in both directions until a good, clear tooth pattern is obtained. Compare the contact patterns on the ring gear teeth with the following illustrations.

Good Contact Pattern

Pattern inspection allows the technician to detect gross errors in set up prior to complete assembly of the differential assembly. Pattern contact should be within the primary area of the ring gear tooth section. Avoid narrow or hard contact with the outer perimeter of the ring gear tooth. Pattern inspection should be on the drive side of the tooth. Correct assembly of the drive pattern will result in satisfactory coast performance.

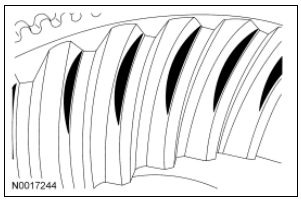
NOTE: If a gross pattern error is detected with the correct backlash, check the pinion shim selection.

Good Contact Pattern



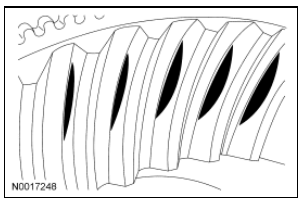
Low Contact Pattern That Is Contacting More Toward the Heel

Gross Pattern Error



High, Thin Contact Pattern In the Center Of the Tooth

Gross Pattern Error



Thick Contact Pattern That Is Contacting Tooth Toward the Heel

Material

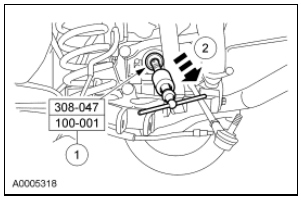
Item	Specification
High Performance Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Premium Long-Life Grease XG-1-C	ESA-M1C75-B

Removal

1. Remove the halfshaft assembly. For additional information, refer to Section 205-05 .
2. **NOTE:** If only a new inboard CV joint stub shaft pilot bearing housing seal is to be installed, engage the bearing cup puller tangs on the inboard CV joint stub shaft pilot bearing housing seal.

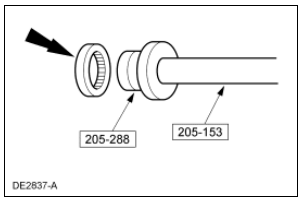
   Remove the inboard CV joint stub shaft pilot bearing housing seal and inboard CV joint stub shaft pilot bearing.

   1. Install the special tools with the tangs firmly engaged on the inboard CV joint stub shaft pilot bearing housing.
   2. Remove the inboard CV joint stub shaft pilot bearing housing seal and inboard CV joint stub shaft pilot bearing.

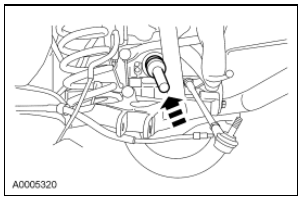


Installation

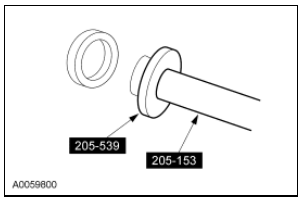
1. Lubricate the new inboard CV joint stub shaft pilot bearing. Place the inboard CV joint stub shaft pilot bearing onto the special tools.
    - Use High Performance Rear Axle Lubricant XY-75W140-QL meeting Ford specification WSL-M2C192-A.



2. Install the inboard CV joint stub shaft pilot bearing into the rear axle housing bore.



3. Lubricate the lip of the inboard CV joint stub shaft pilot bearing housing seal. Place the inboard CV joint stub shaft pilot bearing housing seal onto the special tools.
    - Use Premium Long-Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.



4. ⚠ **CAUTION: Installation of the inboard CV joint stub shaft pilot bearing housing seal without the correct tool can result in early inboard CV joint stub shaft pilot bearing housing seal failure. If the inboard CV joint stub shaft pilot bearing housing seal becomes cocked during installation, remove it and install a new one.**

    Carefully align the inboard CV joint stub shaft pilot bearing housing seal with the housing bore, then install the inboard CV joint stub shaft pilot bearing housing seal.

5. Install the halfshaft assembly. For additional information, refer to Section 205-05 .

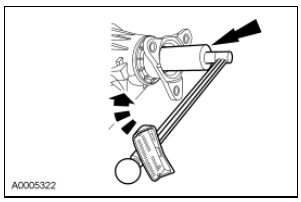
Item	Specification
Premium Long Life Grease XG-1-C	ESA-M1C75-B

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .
3. **⚠ CAUTION: Remove the rear brake calipers to prevent drag during the drive pinion bearing preload adjustment.**

   ⚠ CAUTION: Do not allow the calipers to hang from the brake hoses.

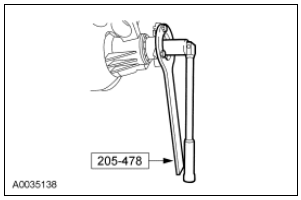
   Remove the rear brake caliper and support bracket as an assembly. Wire the caliper and support bracket out of the way.
4. Remove the driveshaft assembly. For additional information, refer to Section 205-01 .
5. Using a Nm (lb-in) torque wrench on the pinion nut, record the torque necessary to maintain rotation of the drive pinion gear through several revolutions.



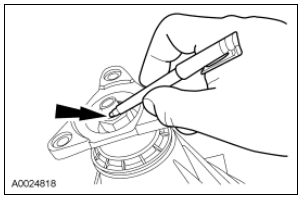
A0005322

6. ⚠ **CAUTION: After removing the differential drive pinion nut, discard it. Always use a new differential drive pinion nut for installation.**

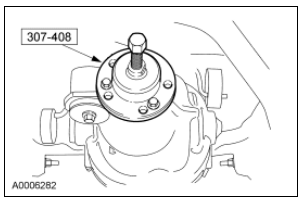
   Use the special tool to hold the rear axle pinion flange while removing the differential drive pinion nut.



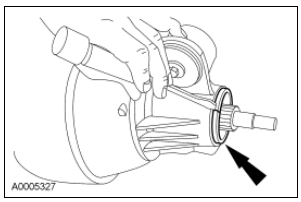
7. Index-mark the rear axle pinion flange and drive pinion gear to maintain initial balance during installation.



8. Using the special tool, remove the rear axle pinion flange.



9. Use a screwdriver to force up the metal flange of the rear axle drive pinion seal. Install gripping pliers and strike with a hammer to remove the rear axle drive pinion seal.

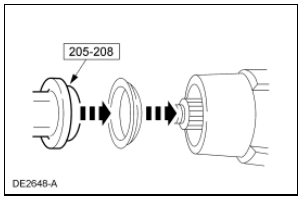


Installation

1. Lubricate the lips of the new rear axle drive pinion seal.
   - Use Premium Long-Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.

2. ⚠ **CAUTION: If the rear axle drive pinion seal becomes misaligned during installation, remove the rear axle drive pinion seal and install a new one.**

   Using the special tool, install the new rear axle drive pinion seal.



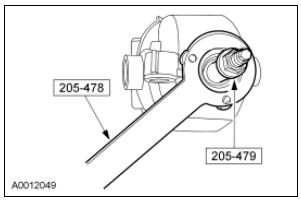
3. Inspect the rear axle pinion flange seal journal for rust, nicks and scratches prior to installing the flange. Polish the rear axle pinion flange seal journal with fine crocus cloth, if necessary.

4. Lubricate the rear axle pinion flange splines.
   - Use Premium Long-Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.

5. **NOTE:** Disregard the index marks if installing a new rear axle pinion flange.

   Align the index marks on the rear axle pinion flange and drive pinion gear.

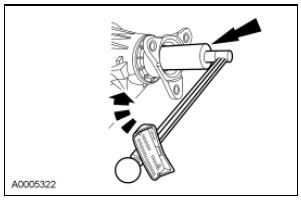
6. Using the special tools, install the rear axle pinion flange.



7. ⚠ **CAUTION: Do not, under any circumstance, loosen the differential drive pinion nut to reduce preload. If it is necessary to reduce preload, install a new differential drive pinion collapsible spacer and differential drive pinion nut.**

   Tighten the differential drive pinion nut to set the preload.

   - Rotate the pinion occasionally to make sure the pinion bearings seat correctly. Take frequent pinion bearing torque preload readings by rotating the drive pinion gear with a Nm (lb-in) torque wrench.
   - If the preload recorded prior to disassembly is lower than the specification for used bearings, tighten the differential drive pinion nut to specification. If the preload recorded prior to disassembly is higher than the specification for used bearings, tighten the differential drive pinion nut to the original reading as recorded.
   - Refer to the torque specification for used pinion bearings in the Specifications portion of this section.



8. Install the rear brake caliper and support bracket.
   - Tighten to 103 Nm (76 lb-ft).

9. Install the driveshaft assembly. For additional information, refer to Section 205-01 .

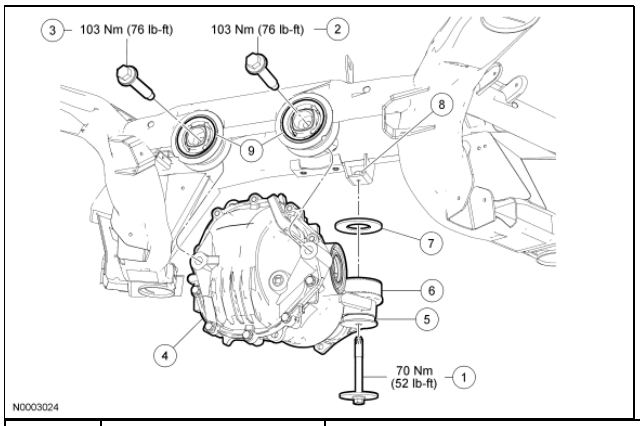
10. Install the rear wheel and tire assemblies. For additional information, refer to Section 204-04 .

Axle Assembly

Printable View (114 KB)

Material

Item	Specification
High Performance Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Threadlock 262 TA-26	WSK-M2G351-A6



Item	Part Number	Description
1	W706464-S426	Rear axle housing support insulator front bolt
2	W701905S	Rear axle housing support insulator rear bolt
3	W701905S	Rear axle housing support insulator rear bolt
4	4000	Rear axle assembly
5	4B424	Rear axle housing support insulator snubber
6	4B431	Rear axle housing support insulator bushing
7	4067	Shim
8	W520114-S	Rear axle housing support insulator nut
9	4B424	Rear axle housing support insulator

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the rear halfshafts. For additional information, refer to Section 205-05 .

3. **CAUTION: To make sure assembly is in the exact same location, index-mark the bolt, nut, washer, flex coupling and pinion flange with paint or marker. Using a different color paint or marker, index-mark the second bolt, nut and washer that retain the driveshaft and flex coupling to the pinion flange and the transmission flange. Do not index-mark the third bolt, nut and washer that retain the driveshaft and flex coupling to the pinion flange. These fasteners are balance weights. Always assemble them in their original positions. Failure to do so can cause a driveshaft NVH concern.**

Index-mark the components.

4. **NOTE:** When installing the flex coupling-to-driveshaft bolts and flex coupling-to-driveshaft bolt nuts, coat the flex coupling-to-driveshaft bolts and flex coupling-to-driveshaft bolt nuts threads with Threadlock 262 TA-26 meeting Ford specification WSK-M2G351-A6.

   Remove the flex coupling-to-driveshaft bolts and flex coupling-to-driveshaft bolt nuts, then disconnect the driveshaft from the rear axle flange.

   - Using mechanics wire, position aside the driveshaft.
   - To install, tighten to 81 Nm (60 lb-ft).

5. Position a suitable transmission jack under the axle housing. Securely strap the axle housing to the transmission jack.

6. Remove the front rear axle housing support insulator bolt.
   - To install, tighten to 70 Nm (52 lb-ft).

7. Remove the 2 rear axle housing support insulator rear bolts.
   - To install, tighten to 103 Nm (76 lb-ft).

8. Lower the axle from the vehicle.

9. To install, reverse the removal procedure.

10. If necessary, fill the axle.
    - Use High Performance Rear Axle Lubricant XY-75W140-QL meeting Ford specification WSL-M2C192-A to 3-5 mm (1/8-3/16 in) from the bottom of the filler hole.

ST1350-A	Gauge, Differential Bearing 205-541

Material

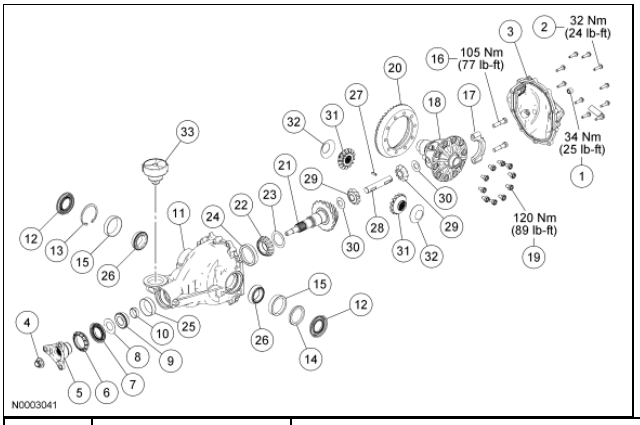
Item	Specification
Premium Long-Life Grease XG-1-C	ESA-M1C75-B
SAE 75W-140 High Performance Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Stud and Bearing Mount TA-27	WSK-M2G349-A1
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4
Marking Compound	

Disassembly

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-04 .

2. Remove the rear axle assembly. For additional information, refer to Axle Assembly in this section.

Drain the axle.



Item	Part Number	Description
1	390943-S	Lubricant fill plug
2	390919-S	Differential housing cover bolts
3	4033	Differential housing cover
4	389546-S	Differential drive pinion nut
5	4851	Rear axle pinion flange
6	4859	Rear pinion oil seal deflector
7	4676	Rear pinion oil seal
8	4670	Rear pinion oil seal slinger
9	4621	Outer pinion bearing
10	4662	Drive pinion collapsible spacer
11	4010	Differential housing
12	4B416	Halfshaft housing seal
13	13277	Selective snap ring
14	4067	Differential bearing shim
15	4222	Differential bearing cup
16	46108-S	Bearing cap bolt
17		Bearing cap
18	4204	Differential case
19	4982	Differential ring gear bolts
20	4209	Differential ring gear
21	4209	Differential pinion gear
22	4630	Inner pinion bearing
23	4663	Differential pinion bearing adjustment shim
24	4628	Inner pinion bearing cup
25	4616	Outer pinion bearing cup
26	4221	Differential bearing
27	4241	Differential pinion shaft roll pin
28	4211	Differential pinion shaft
29	4215	Differential pinion gear
30	4230	Differential pinion gear thrust washer
31	4236	Differential side gear
32	4228	Differential side gear thrust washer

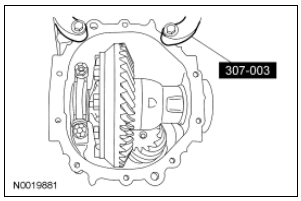
3.

33	4B431	Rear axle housing support insulator

4. **⚠ CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new Silicone Gasket and Sealant F7AZ-19554-EA meeting Ford specification WSE-M4G323-A4. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

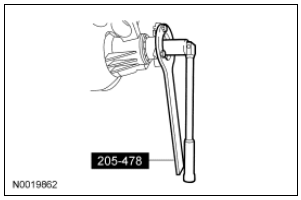
   Remove the differential housing cover.

5. Mount the differential assembly in the special tool.

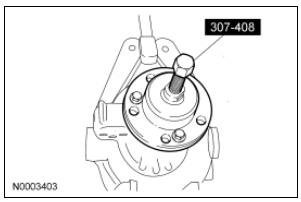


6. **⚠ CAUTION: After removing the differential drive pinion nut, discard it. Use a new differential drive pinion nut for installation.**

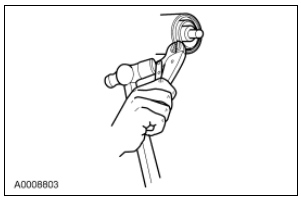
   Use the special tool to hold the rear axle pinion flange while removing the differential drive pinion nut.



7. Using the special tool, remove the rear axle pinion flange.

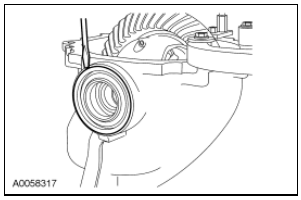


8. Use a screwdriver to force up the metal flange of the rear pinion oil seal. Install gripping pliers and strike with a hammer to remove the rear pinion oil seal.

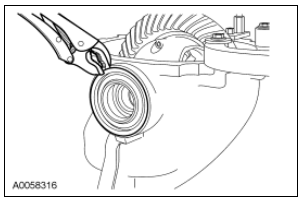


9. Remove the rear pinion oil seal slinger, outer pinion bearing and the drive pinion collapsible spacer.

10. Force up the metal flange on the halfshaft housing seals.

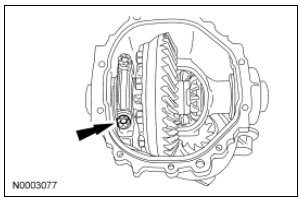


11. Install gripping pliers and strike with a hammer to remove the halfshaft housing seals from the housing.



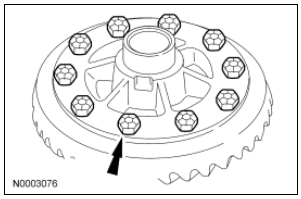
12. Remove the selective snap ring, differential bearing shim and the differential bearing cups.

13. Index mark the differential bearing cap, then remove the differential bearing cap bolts and bearing cap.

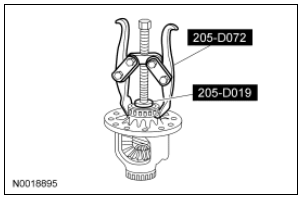


14. Remove the differential case assembly.

15. Remove the differential ring gear bolts then the differential ring gear.



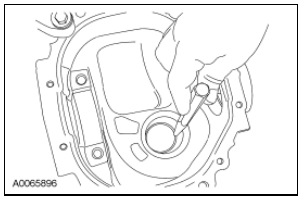
16. Using the special tools, remove the differential bearings.



17. Remove the differential pinion gear.

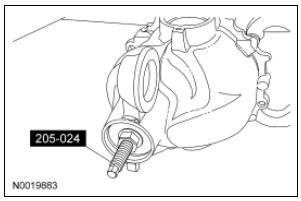
18. Using a drift punch and a hammer, remove the inner pinion bearing cup.

19. Using a drift punch and a hammer, remove the outer pinion bearing cup.



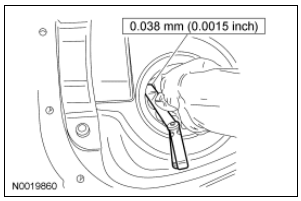
Assembly

1. Using the special tool, install the differential drive pinion bearing cups.
   - Position the bearing cups on the special tool.
   - Position the special tool and the bearing cups in the differential housing.
   - Tighten the special tool to fully seat the bearing cups in the bores.



2. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

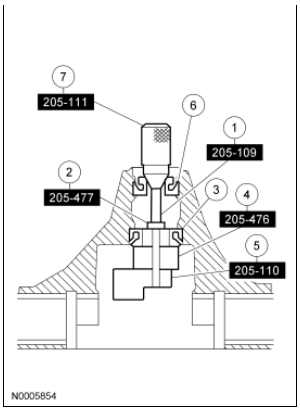
   Make sure the differential pinion bearing cups are correctly seated.



3. ⚠ **CAUTION: Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Install the differential pinion bearings and special tools as shown.



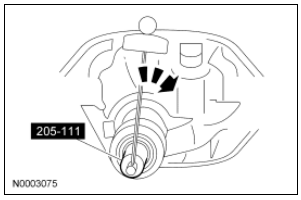
Item	Part Number	Description
1	205-109	Adapter for 205-S127

2	205-477	Depth Gauge/Aligner
3	4630	Rear (inner) pinion bearing
4	205-476	Depth Gauge, Drive Pinion
5	205-110	Adapter for 205-S127
6	4621	Front (outer) pinion bearing
7	205-111	Adapter for 205-S127

4. **NOTE:** This step duplicates differential pinion bearing preload.

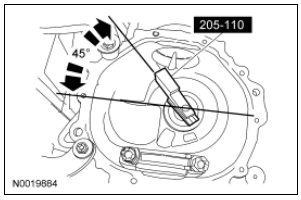
   Thread the special tool onto the screw.

   - Tighten to 2.2 Nm (20 lb-in).

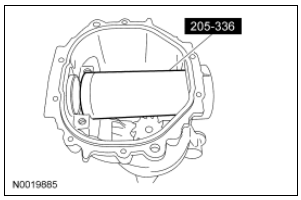


5. ⚠ **CAUTION: Offset the special tool to obtain an accurate reading.**

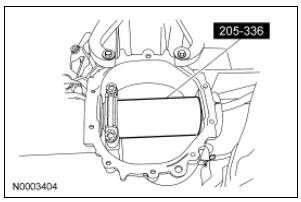
   Rotate the special tool several half turns to seat the differential pinion bearings. Position the special tool as shown.



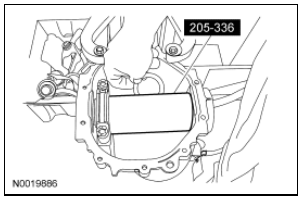
6. Install the special tool.
   - Position the special tool in the differential housing differential bearing seat.



7. Install the differential bearing cap, then install the differential bearing cap bolts.
   - Tighten to 105 Nm (77 lb-ft).



8. Use a differential pinion bearing adjustment shim as a gauge for shim selection. Check the differential pinion bearing adjustment shim thickness between the Gauge Block and the Gauge Tube. A slight drag indicates correct differential pinion bearing adjustment shim selection.

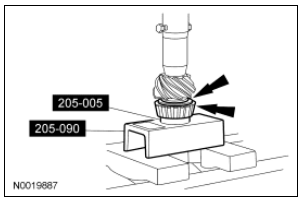


9. Remove all of the special tools.

10. **⚠ CAUTION: Use the same differential pinion bearings and differential pinion bearing adjustment shim from the differential pinion bearing adjustment shim selection procedure for final assembly.**

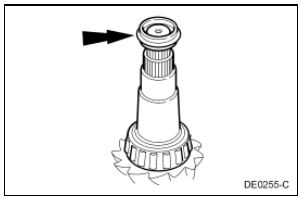
    Position the differential pinion bearing adjustment shim and the inner pinion bearing on the differential pinion stem.

11. Using the special tools and a suitable press, firmly seat the differential pinion bearing adjustment shim and inner pinion bearing on the differential pinion stem.



12. **⚠ CAUTION: Make sure the splines on the differential pinion stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.**

    Place a new drive pinion collapsible spacer on the differential pinion stem against the differential pinion stem shoulder.



13. Install the differential pinion gear with the drive pinion collapsible spacer in the differential housing.

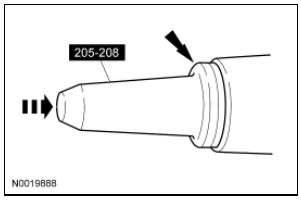
14. Install the outer pinion bearing and rear pinion oil seal slinger.

15. **⚠ CAUTION: Installation without the correct tool can result in early rear pinion oil seal failure.**

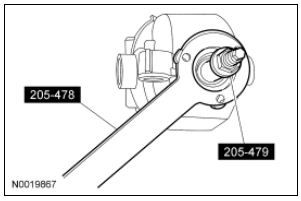
    ⚠ CAUTION: If the rear pinion oil seal becomes misaligned during installation, remove it and install a new one.

    NOTE: Coat the rear pinion oil seal lips with grease.

    Using the special tool, install the new rear pinion oil seal.



16. Using the special tools, install the rear axle pinion flange.

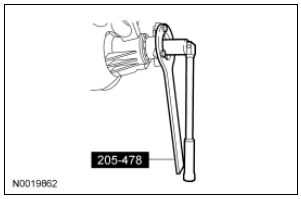


17. ⚠ **CAUTION: Do not, under any circumstance, loosen the differential drive pinion nut to reduce differential pinion bearing preload. If it is necessary to reduce differential pinion bearing preload, install a new drive pinion collapsible spacer and differential drive pinion nut.**

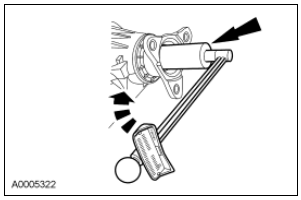
    ⚠ **CAUTION: Remove the special tool while taking differential pinion bearing preload readings with the Nm (lb-in) torque wrench.**

    Use the special tool to hold the rear axle pinion flange while tightening the differential drive pinion nut.

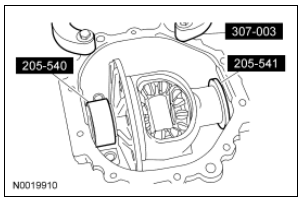
    - Rotate the differential pinion gear occasionally to make sure the differential pinion bearings seat correctly. Take frequent differential pinion bearing preload readings by rotating the differential pinion gear with a Nm (lb-in) torque wrench.



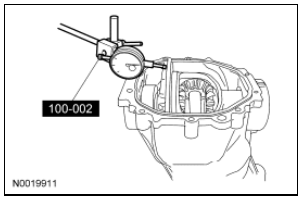
18. Tighten the differential drive pinion nut to set the differential pinion bearing preload.



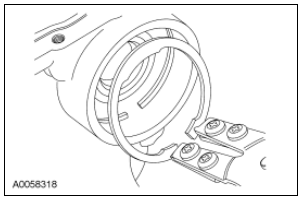
19. Install the special tools on the differential case.



20. Position the special tool on the differential case in the differential housing.



21. Install a unique set-up selective snap ring with a thickness of 2.54 mm (0.100 in).



22. **NOTE:** Repeat this step until obtaining a consistent reading.

    Measure the total end play.

    - Attach the special tools and position the indicator tip on the machined surface of the differential case flange.
    - Move the differential case to the left and the right (as far as possible).
    - Record the reading in Line A.

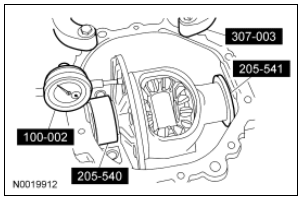
    Differential Bearing Shim Selection Chart

8.0 Inch Lightweight Axle	Example	Actual
Line A Total end play without ring gear	0.230	
Line B Total end play with ring gear	0.193	
Line C Subtract Line B from Line A	0.037	
Line D Initial backlash clearance	0.016	0.016
Line E Set-up snap ring thickness	0.100	0.100
Line F Left Master Bearing compensation	0.100	0.100
Line G Carrier bearing preload	0.012	0.012

    To determine the snap ring thickness, add lines C, D and E (Example: 0.037 + 0.016 + 0.100 = 0.153 snap ring thickness).

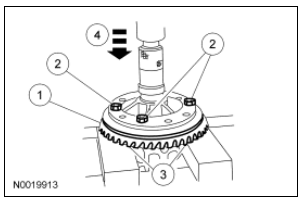
    To determine the bearing shim thickness, add lines A, F and G. Subtract line C and D from the sum. Example:

    - 0.230 + 0.100 + 0.012 = 0.342
    - 0.342 - 0.037 - 0.016 = 0.289 bearing shim thickness

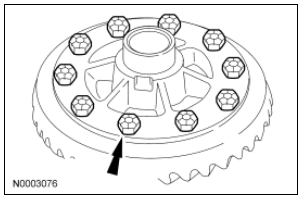


23. Remove the dial indicator and the differential case from the differential housing.

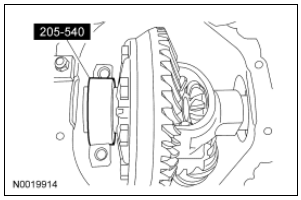
24. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start 3 differential ring gear bolts to align the holes in the differential ring gear and the differential case.
    3. Place the differential case and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.



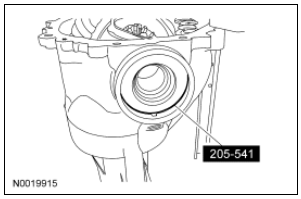
25. Install the remaining differential ring gear bolts. Apply sealer to the ring gear bolt threads.
    - Tighten to 120 Nm (89 lb-ft).



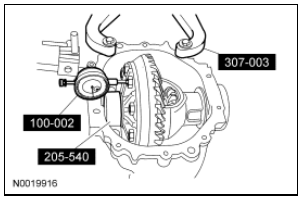
26. Place the differential case with the special tool into the differential housing.



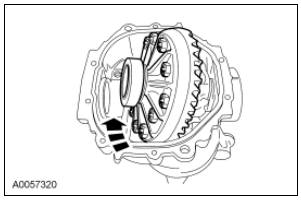
27. Install the special tool.



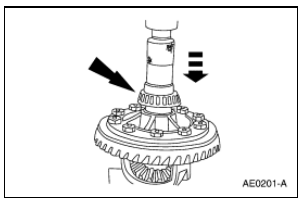
28. Measure the end play.
    - Attach the special tool and position the indicator tip on the machined surface of the differential case flange.
    - Rock the differential ring gear to allow full mesh with the drive pinion gear.
    - With the gears in full mesh, set the special tool to zero.
    - Move the differential case as far as possible to the left and note the reading.
    - Record the reading on the differential bearing shim selection procedure Line B.
        - ♦ Remove the special tool.



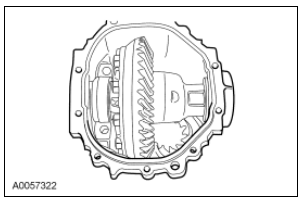
29. Remove the differential case from the differential housing.



30. Using a suitable press, press the differential bearings on the differential case.



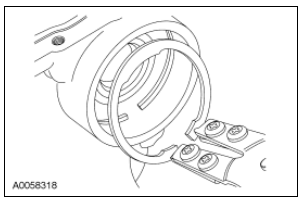
31. Place the differential case and differential bearing cups in the differential case.



32. **NOTE:** Select the correct size selective snap ring using the differential bearing shim selection chart.

    NOTE: To determine the thickness of the selective snap ring to be used, subtract Line B from Line A. Add Lines D and E to the difference. This is the thickness of the selective snap ring required.

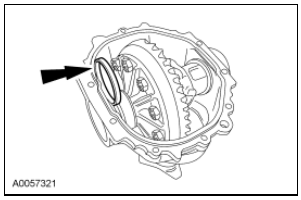
    Place the selective snap ring in the differential housing.



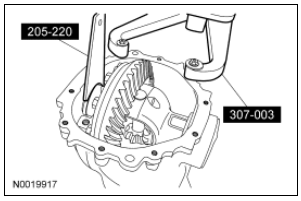
33. **NOTE:** Select the correct size selective bearing shim using the differential bearing shim selection chart.

    NOTE: To determine the thickness of the differential bearing shim to be used, add Lines A, F and G. Subtract Lines C and D from the sum. This is the thickness of the differential bearing shim required.

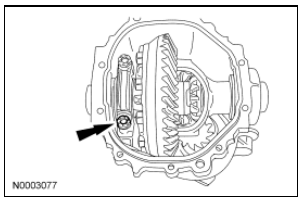
    Position the differential bearing shim indicated by the differential bearing shim selection chart.



34. Using the special tools, seat the differential bearing shim in the differential housing.

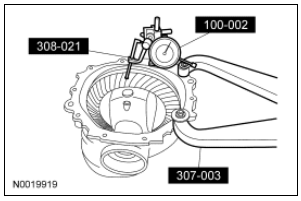


35. Install the differential bearing cap, then the differential bearing cap bolts in the original location.
    - Tighten to 105 Nm (77 lb-ft).



36. Lubricate the lips of the halfshaft housing seal with grease.

37. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    - Attach the special tool.
    - Position the special tool tip centrally on a drive tooth.
    - Zero the indicator.
    - Turn the differential ring gear without turning the differential pinion gear. Record the indicator reading. The allowable backlash is 0.127 mm (0.005 in) to 0.228 mm (0.009 in) and must not vary more than 0.076 mm (0.003 in) between points measured. A backlash variation of more than 0.076 mm (0.003 in) between points checked indicates gear/case runout.
        - ♦ If backlash is within specifications, install the axle assembly.
        - ♦ To correct for a high or low backlash, proceed as follows.



38. To correct for high or low backlash, increase or decrease the thickness of the differential bearing shim and decrease or increase the thickness of the selective snap ring by the same amount. Refer to the following tables when adjusting the backlash. When the backlash is within specifications, install the differential assembly.

Backlash Change Required		Thickness Change Required	
mm	**in**	**mm**	**in**

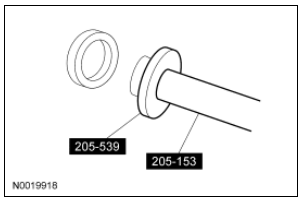
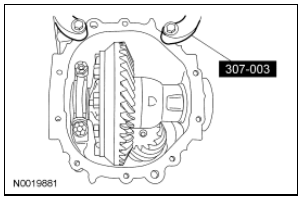
39. Using the special tools, install the halfshaft housing seal.



40. Apply marking compound and rotate the differential assembly 5 complete revolutions.

41. Verify an acceptable pattern check. For additional information, refer to Diagnosis and Testing in this section.

42. Remove the differential assembly from the special tool.



43. ⚠ **CAUTION: The differential housing cover must be installed within 15 minutes of application of the sealant.**

    ⚠ **CAUTION: Allow the Silicone Gasket and Sealant to cure for 1 hour before filling the axle with lubricant.**

    Apply a continuous bead of Silicone Gasket and Sealant to the differential housing cover mounting surface, then install the differential housing cover.

44. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

45. Fill the axle with the specified amount of specified lubricant.

Differential Bearings

Material

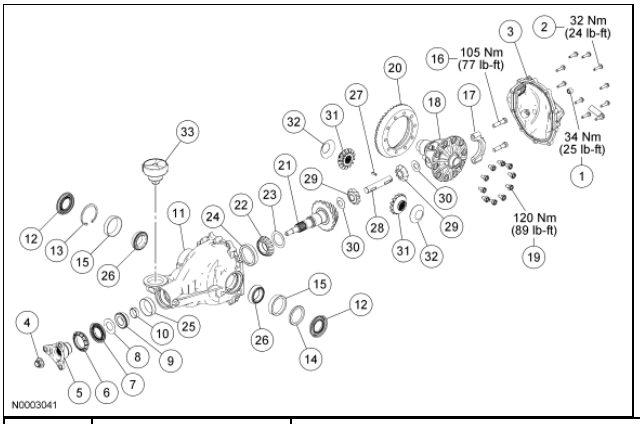
Item	Specification
Premium Long-Life Grease XG-1-C	ESA-M1C75-B
SAE 75W-140 High Performance Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Stud and Bearing Mount TA-27	WSK-M2G349-A1
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4
Marking Compound	

Disassembly

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-04 .

2. Remove the rear axle assembly. For additional information, refer to Axle Assembly in this section.

3. Drain the axle lubricant.



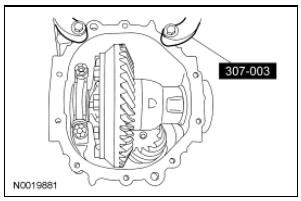
Item	Part Number	Description
1	390943-S	Lubricant fill plug
2	390919-S	Differential housing cover bolts
3	4033	Differential housing cover
4	389546-S	Differential drive pinion nut
5	4851	Rear axle pinion flange
6	4859	Rear pinion oil seal deflector
7	4676	Rear pinion oil seal
8	4670	Rear pinion oil seal slinger
9	4621	Outer pinion bearing
10	4662	Drive pinion collapsible spacer
11	4010	Differential housing
12	4B416	Halfshaft housing seal
13	13277	Selective snap ring
14	4067	Differential bearing shim
15	4222	Differential bearing cup
16	46108-S	Bearing cap bolt
17		Bearing cap
18	4204	Differential case
19	4982	Differential ring gear bolts
20	4209	Differential ring gear
21	4209	Differential pinion gear
22	4630	Inner pinion bearing
23	4663	Differential pinion bearing adjustment shim
24	4628	Inner pinion bearing cup
25	4616	Outer pinion bearing cup
26	4221	Differential bearing
27	4241	Differential pinion shaft roll pin
28	4211	Differential pinion shaft

29	4215	Differential pinion gear
30	4230	Differential pinion gear thrust washer
31	4236	Differential side gear
32	4228	Differential side gear thrust washer
33	4B431	Rear axle housing support insulator

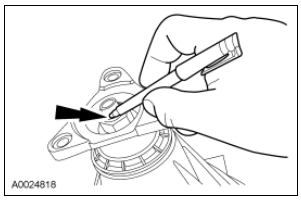
4. ⚠ **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new Silicone Gasket and Sealant F7AZ-19554-EA meeting Ford specification WSE-M4G323-A4. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

   Remove the differential housing cover.

5. Mount the differential assembly in the special tool.

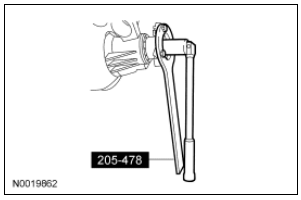


6. Index-mark the rear axle pinion flange to the differential pinion stem.

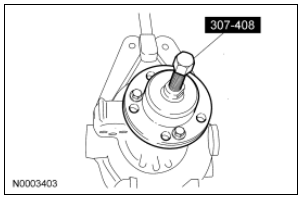


7. ⚠ **CAUTION: After removing the differential drive pinion nut, discard it. Use a new differential drive pinion nut for installation.**

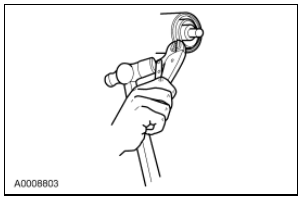
   Use the special tool to hold the rear axle pinion flange while removing the differential drive pinion nut.



8. Using the special tool, remove the rear axle pinion flange.

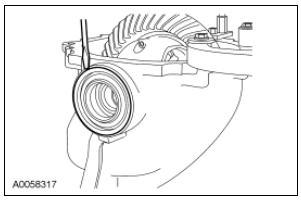


9. Use a screwdriver to force up the metal flange of the rear pinion oil seal. Install gripping pliers and strike with a hammer to remove the rear pinion oil seal.

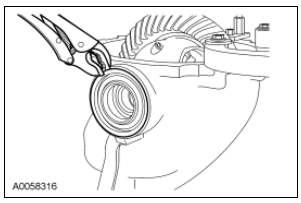


10. Remove the rear pinion oil seal slinger, outer pinion bearing and the drive pinion collapsible spacer.

11. Force up the metal flange on the halfshaft housing seal.

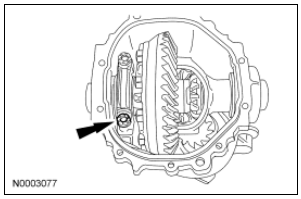


12. Install gripping pliers and strike with a hammer to remove the halfshaft housing seals from the housing.

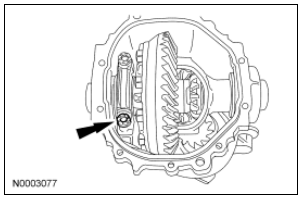


13. Remove the selective snap ring, differential bearing shim and the differential bearing cups.

14. Install the differential bearing cap, then the differential bearing cap bolts in the original location.
    - Tighten to 105 Nm (77 lb-ft).

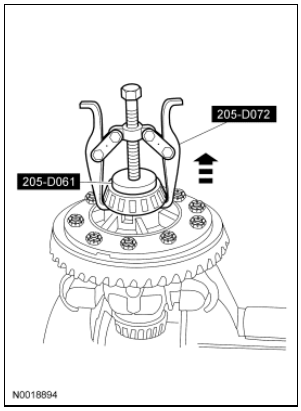


15. Remove the differential bearing cap bolts and bearing cap after index-marking the original location.



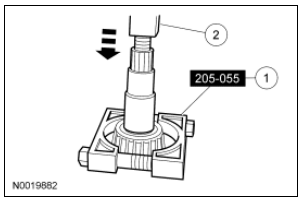
16. Remove the differential case assembly.

17. Using the special tools, remove the differential bearings.



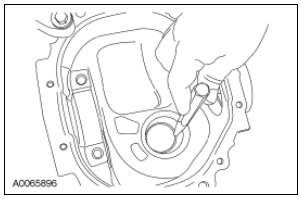
18. Remove the differential pinion gear.

19. Using the special tool and a suitable press, remove the inner pinion bearing.
    1. Position the special tool under the inner pinion bearing.
    2. Press the inner pinion bearing off the differential pinion gear.



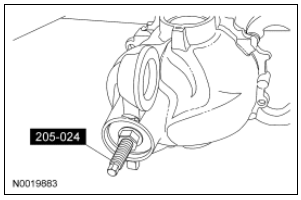
20. Using a drift punch and a hammer, remove the inner pinion bearing cup.

21. Using a drift punch and a hammer, remove the outer pinion bearing cup.



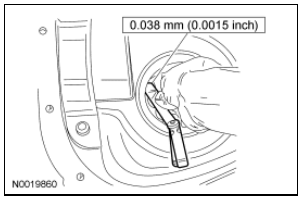
Assembly

1. Using the special tool, install the differential drive pinion bearing cups.
    - Position the bearing cups on the special tool.
    - Position the special tool and the bearing cups in the differential housing.
    - Tighten the special tool to fully seat the bearing cups in the bores.



2. **NOTE:** If a feeler gauge of the specification shown can be inserted between a cup and the bottom of its bore at any point around the cup, the cup is not correctly seated.

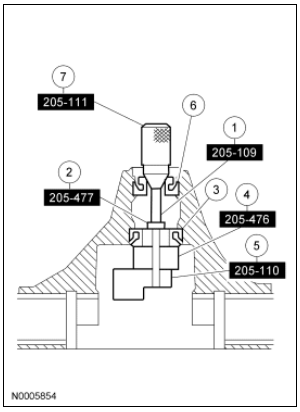
   Make sure the differential pinion bearing cups are correctly seated.



3. ⚠ **CAUTION: Use the same drive pinion bearings and the drive pinion bearing adjustment shim from the drive pinion bearing adjustment shim selection procedure for final assembly.**

   NOTE: Install new drive pinion bearings without any additional lubricant since the anti-rust oil provides adequate lubricant without upsetting the drive pinion bearing preload settings.

   Install the differential pinion bearings and special tools as shown.

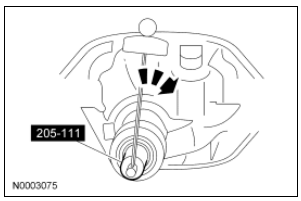


Item	Part Number	Description
1	205-109	Adapter for 205-S127
2	205-477	Depth Gauge/Aligner
3	4630	Rear (inner) pinion bearing
4	205-476	Depth Gauge, Drive Pinion
5	205-110	Adapter for 205-S127
6	4621	Front (outer) pinion bearing
7	205-111	Adapter for 205-S127

4. **NOTE:** This step duplicates differential pinion bearing preload.

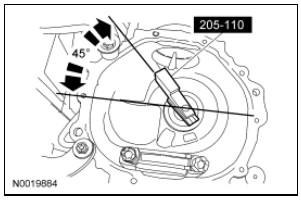
   Thread the special tool onto the screw.

   - Tighten to 2.2 Nm (20 lb-in).

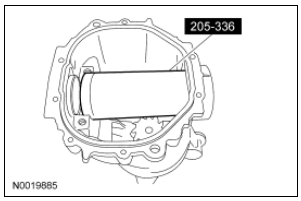


5. ⚠ **CAUTION: Offset the special tool to obtain an accurate reading.**

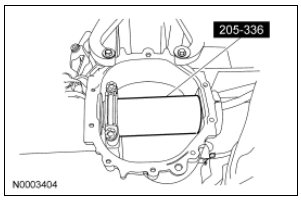
   Rotate the special tool several half turns to seat the differential pinion bearings. Position the special tool as shown.



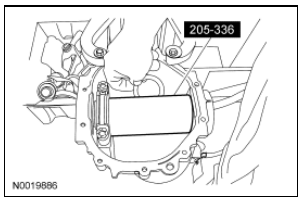
6. Install the special tool.
   - Position the special tool in the differential housing differential bearing seat.



7. Install the differential bearing cap, then install the differential bearing cap bolts.
   - Tighten to 105 Nm (77 lb-ft).



8. Use a differential pinion bearing adjustment shim as a gauge for shim selection. Check the differential pinion bearing adjustment shim thickness between the Gauge Block and the Gauge Tube. A slight drag indicates correct differential pinion bearing adjustment shim selection.

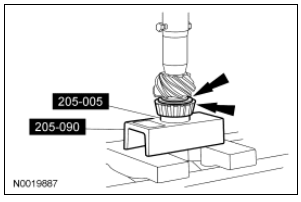


9. Remove all of the special tools.

10. ⚠ **CAUTION: Use the same differential pinion bearings and differential pinion bearing adjustment shim from the differential pinion bearing adjustment shim selection procedure for final assembly.**

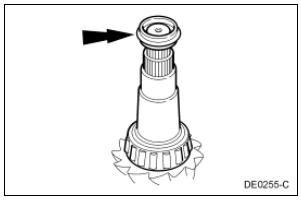
    Position the differential pinion bearing adjustment shim and the inner pinion bearing on the differential pinion stem.

11. Using the special tools and a suitable press, firmly seat the differential pinion bearing adjustment shim and inner pinion bearing on the differential pinion stem.



12. ⚠ **CAUTION: Make sure the splines on the differential pinion stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.**

    Place a new drive pinion collapsible spacer on the differential pinion stem against the differential pinion stem shoulder.



13. Install the differential pinion gear with the drive pinion collapsible spacer in the differential housing.

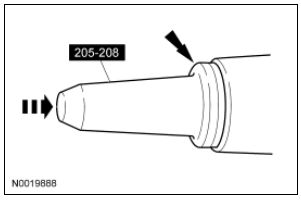
14. Install the outer pinion bearing and rear pinion oil seal slinger.

15. ⚠ **CAUTION: Installation without the correct tool can result in early rear pinion oil seal failure.**

    ⚠ **CAUTION: If the rear pinion oil seal becomes misaligned during installation, remove it and install a new one.**

    NOTE: Coat the rear pinion oil seal lips with grease.

    Using the special tool, install the new rear pinion oil seal.

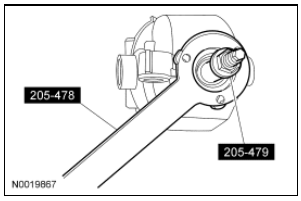


16. **NOTE:** Disregard the index marks if installing a new rear axle pinion flange.

    Position the rear axle pinion flange.

    - Lubricate the rear axle pinion flange splines with grease.

17. Using the special tools, install the rear axle pinion flange.

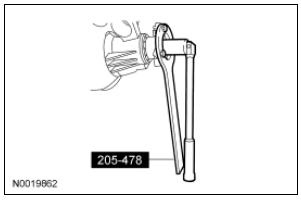


18. ⚠ **CAUTION: Do not, under any circumstance, loosen the differential drive pinion nut to reduce differential pinion bearing preload. If it is necessary to reduce differential pinion bearing preload, install a new drive pinion collapsible spacer and differential drive pinion nut.**

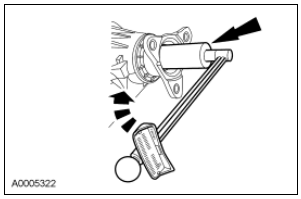
    ⚠ **CAUTION: Remove the special tool while taking differential pinion bearing preload readings with the Nm (lb-in) torque wrench.**

Use the special tool to hold the rear axle pinion flange while tightening the differential drive pinion nut.

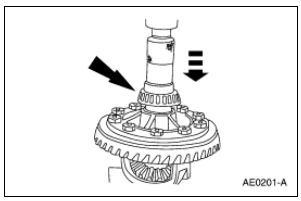
- Rotate the differential pinion gear occasionally to make sure the differential pinion bearings seat correctly. Take frequent differential pinion bearing preload readings by rotating the differential pinion gear with a Nm (lb-in) torque wrench.



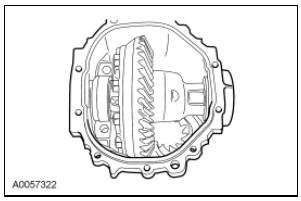
19. Tighten the differential drive pinion nut to set the differential pinion bearing preload.



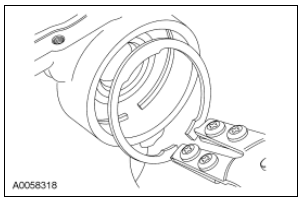
20. Using a suitable press, press the differential bearings on the differential case.



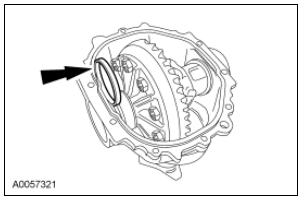
21. Place the differential case and differential bearing cups in the differential case.



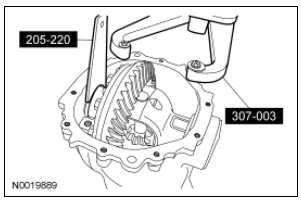
22. Place the original selective snap ring in the differential housing.



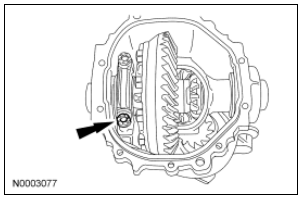
23. Position the original differential bearing shim.



24. Using the special tools, seat the differential bearing shim in the differential housing.

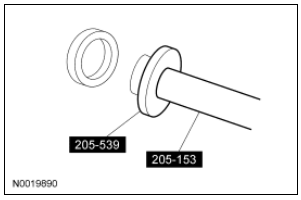


25. Install the differential bearing cap, then the differential bearing cap bolts in their original locations.
    - Tighten to 105 Nm (77 lb-ft).

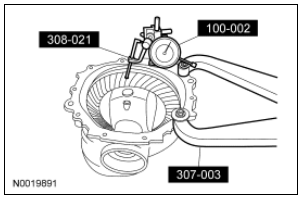


26. Lubricate the lips of the halfshaft housing seal.
    - Use Premium Long-Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.

27. Using the special tools, install the halfshaft housing seal.



28. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    - Attach the special tool.
    - Position the special tool tip centrally on a drive tooth.
    - Zero the indicator.
    - Turn the differential ring gear without turning the differential pinion gear. Record the indicator reading. The allowable backlash is 0.127 mm (0.005 in) to 0.228 mm (0.009 in) and must not vary more than 0.076 mm (0.003 in) between points measured. A backlash variation of more than 0.076 mm (0.003 in) between points checked indicates gear/case runout.
        - ♦ If backlash is within specifications, install the axle assembly.
        - ♦ To correct for a high or low backlash, proceed as follows.



29. To correct for high or low backlash, increase or decrease the thickness of the differential bearing shim and decrease or increase the thickness of the selective snap ring by the same amount. Refer to the following tables when adjusting the backlash. When the backlash is within specifications, install the differential assembly.

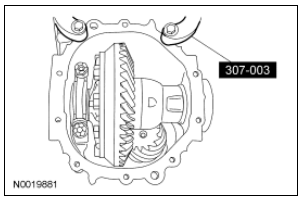
30. Apply marking compound and rotate the differential assembly 5 complete revolutions.

31. Verify an acceptable pattern check. For additional information, refer to Section 205-00.

32. Remove the differential assembly from the special tool.



33. ⚠ **CAUTION: The differential housing cover must be installed within 15 minutes of application of the Silicone Gasket and Sealant F7AZ-19554-EA meeting Ford specification WSE-M4G323-A4.**

⚠ CAUTION: Allow the Silicone Gasket and Sealant to cure for 1 hour before filling the axle with lubricant.

Apply a continuous bead of Silicone Gasket and Sealant to the differential housing cover mounting surface, then install the differential housing cover.

34. Fill the axle with the specified amount of the specified lubricant.

35. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

Rear Axle Housing Support Insulator

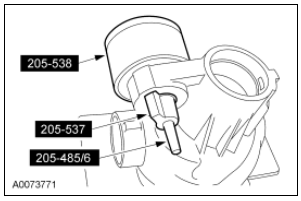
 ST1159-A	Remover, Axle Bushing 205-538
ST2269-A	Installer, Front Axle Mounting Bushing (T96T-5638-A) 205-369

Removal

NOTE: The procedure to remove the rear axle housing support insulator from the axle or the frame is the same.

1. Remove the axle assembly. For additional information, refer to Axle Assembly in this section.

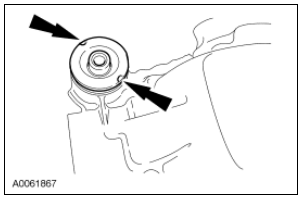
2. Using the special tool, remove the rear axle housing support insulator from the axle.



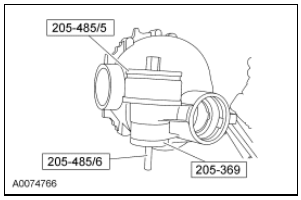
Installation

1. **NOTE:** Install the rear axle housing support insulator into the frame with the rubber legs positioned vertically.

   Insert the rear axle housing support insulator and make sure the notches are aligned 45 degrees from a forward and aft location.



2. Using the special tool, install the rear axle housing support insulator.



3. Install the axle assembly. For additional information, refer to Axle Assembly in this section.

Material

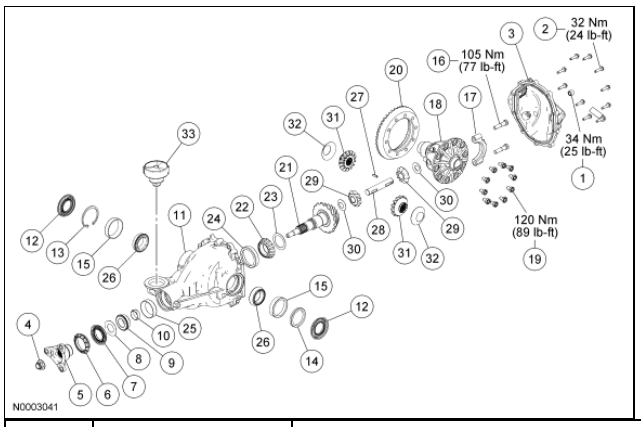
Item	Specification
Premium Long-Life Grease XG-1-C	ESA-M1C75-B
High Performance Rear Axle Lubricant XY-75W140-QL	WSL-M2C192-A
Stud and Bearing Mount TA-27	WSK-M2G349-A1
Silicone Gasket and Sealant F7AZ-19554-EA	WSE-M4G323-A4

Disassembly

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the rear axle assembly. For additional information, refer to Axle Assembly in this section.

3. Drain the axle.



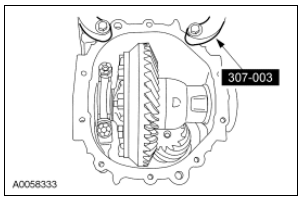
Item	Part Number	Description
1	390943-S	Lubricant fill plug
2	390919-S	Differential housing cover bolts
3	4033	Differential housing cover
4	389546-S	Differential drive pinion nut
5	4851	Rear axle pinion flange
6	4859	Rear pinion oil seal deflector
7	4676	Rear pinion oil seal
8	4670	Rear pinion oil seal slinger
9	4621	Outer pinion bearing
10	4662	Drive pinion collapsible spacer
11	4010	Differential housing
12	4B416	Halfshaft housing seal
13	13277	Selective snap ring
14	4067	Differential bearing shim
15	4222	Differential bearing cup
16	46108-S	Bearing cap bolt
17		Bearing cap
18	4204	Differential case
19	4982	Differential ring gear bolts
20	4209	Differential ring gear
21	4209	Differential pinion gear
22	4630	Inner pinion bearing
23	4663	Differential pinion bearing adjustment shim
24	4628	Inner pinion bearing cup
25	4616	Outer pinion bearing cup
26	4221	Differential bearing
27	4241	Differential pinion shaft roll pin
28	4211	Differential pinion shaft
29	4215	Differential pinion gear
30	4230	Differential pinion gear thrust washer

31	4236	Differential side gear
32	4228	Differential side gear thrust washer
33	4B431	Rear axle housing support insulator

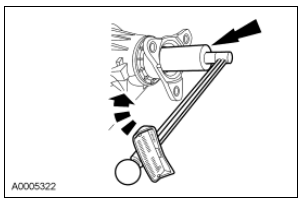
4. ⚠ **CAUTION: The machined surfaces on the differential housing and the differential housing cover must be clean and free of oil before applying the new Silicone Gasket and Sealant F7AZ-19554-EA meeting Ford specification WSE-M4G323-A4. Cover the inside of the axle before cleaning the machined surface to prevent contamination.**

   Remove the differential housing cover.

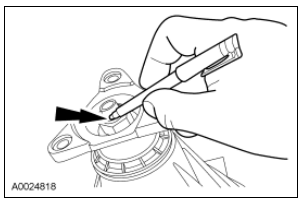
5. Mount the differential assembly in the special tool.



6. Install a Nm (lb-in) torque wrench on the differential drive pinion nut and record the torque necessary to maintain rotation of the differential pinion gear through several revolutions.

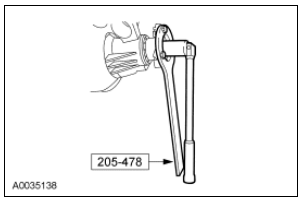


7. Index-mark the rear axle pinion flange to the differential pinion stem.

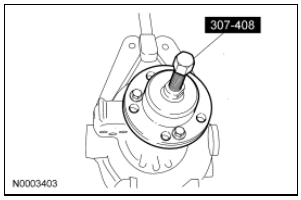


8. ⚠ **CAUTION: After removing the differential drive pinion nut, discard it. Use a new differential drive pinion nut for installation.**

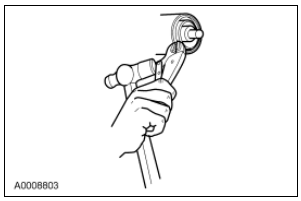
   Use the special tool to hold the rear axle pinion flange while removing the differential drive pinion nut.



9. Using the special tool, remove the rear axle pinion flange.

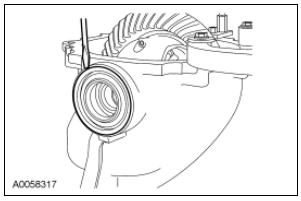


10. Use a screwdriver to force up the metal flange of the rear pinion oil seal. Install gripping pliers and strike with a hammer to remove the rear pinion oil seal.

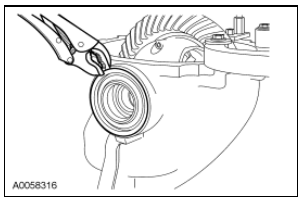


11. Remove the rear pinion oil seal slinger, outer pinion bearing and the drive pinion collapsible spacer.

12. Force up the metal flange on the halfshaft housing seal.



13. Install gripping pliers and strike with a hammer to remove the halfshaft housing seal from the housing.



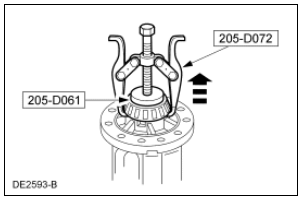
14. Repeat for the other side.

15. Remove the selective snap ring, differential bearing shim and the differential bearing cups.

16. Remove the differential case assembly.

17. Remove the differential ring gear bolts, then the differential ring gear.

18. Using the special tools, remove the differential bearing.
    - Repeat for the other side.

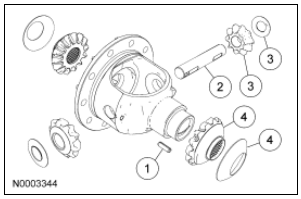


19. **NOTE:** Drive the differential pinion shaft roll pin from the differential pinion shaft after the

differential pinion shaft is removed from the differential case. Discard the differential pinion shaft roll pin.

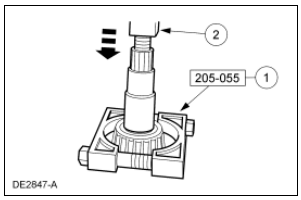
If necessary, disassemble the differential case as follows:

1. Using a drift punch and a hammer, drive the differential pinion shaft roll pin into the differential pinion shaft until bottomed out. The differential pinion shaft roll pin will remain in the differential pinion shaft when the differential pinion shaft is removed from the differential case.
2. Remove the differential pinion shaft.
3. Remove the differential pinion gears and differential pinion gear thrust washers.
4. Remove the differential side gears and differential side gear thrust washers.



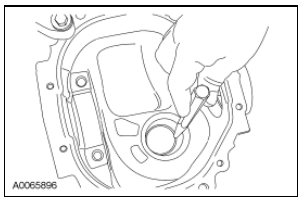
20. Remove the differential pinion gear.

21. Using the special tool and a suitable press, remove the inner pinion bearing.
    1. Position the special tool under the inner pinion bearing.
    2. Press the inner pinion bearing off of the differential pinion gear.



22. Using a drift punch and a hammer, remove the inner pinion bearing cup.

23. Using a drift punch and a hammer, remove the outer pinion bearing cup.

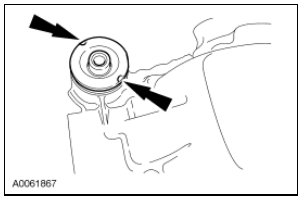


24. If necessary, remove the rear axle housing support insulator. For additional information, refer to Rear Axle Housing Support Insulator in this section.

25. Inspect all components for wear or damage. Install new components as necessary.

Assembly

1. If removed, install the rear axle housing support insulator. For additional information, refer to Rear Axle Housing Support Insulator in this section.

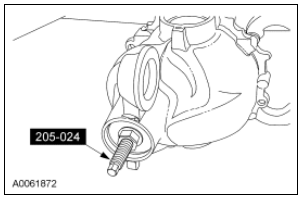


2. ⚠ **CAUTION: Always install a new differential pinion shaft roll pin.**

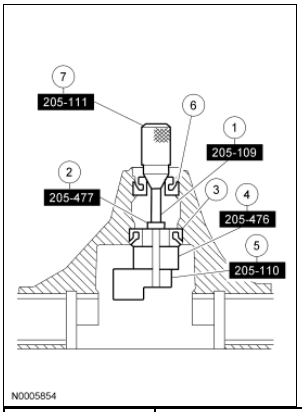
   If disassembled, assemble the differential case as follows:

   1. Install the differential side gears and differential side gear thrust washers.
   2. Install the differential pinion gears and differential pinion gear thrust washers.
   3. Install the differential pinion shaft.
   4. Install the differential pinion shaft roll pin so the top of the roll pin is flush with the differential case.

3. Using the special tool, install the differential drive pinion bearing cup(s).
   - Position the bearing cup(s) on the special tool.
   - Position the special tool and the bearing cup(s) in the differential housing.
   - Tighten the special tool to fully seat the bearing cup(s) in the bore(s).



4. Install the differential pinion bearings and special tools as shown.

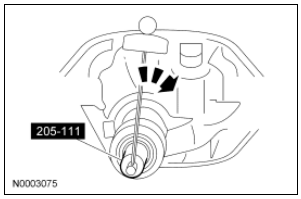


Item	Part Number	Description
1	205-109	Adapter for 205-S127
2	205-477	Depth Gauge/Aligner
3	4630	Rear (inner) pinion bearing
4	205-476	Depth Gauge, Drive Pinion
5	205-110	Adapter for 205-S127
6	4621	Front (outer) pinion bearing
7	205-111	Adapter for 205-S127

5. **NOTE:** This step duplicates differential pinion bearing preload.

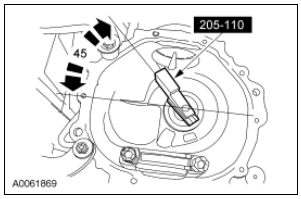
Thread the special tool onto the screw.

- Tighten to 2.2 Nm (20 lb-in).

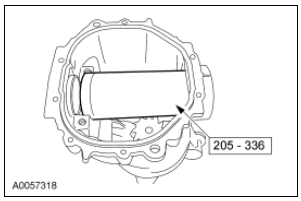


6. ⚠ **CAUTION: Offset the special tool to obtain an accurate reading.**

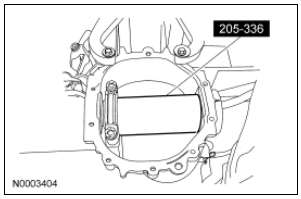
   Rotate the special tool several half turns to seat the differential pinion bearings. Position the special tool as shown.



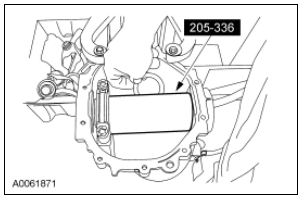
7. Install the special tool.
   - Position the special tool in the differential housing differential bearing seat.



8. Install the differential bearing cap, then install the differential bearing cap bolts.
   - Tighten to 105 Nm (77 lb-ft).



9. Use a differential pinion bearing adjustment shim as a gauge for shim selection. Check the differential pinion bearing adjustment shim thickness between the Gauge Block and the Gauge Tube. A slight drag indicates correct differential pinion bearing adjustment shim selection.



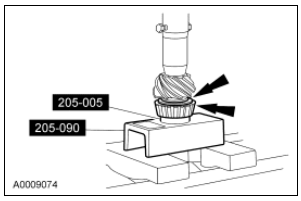
10. Remove all of the special tools.

11. ⚠ **CAUTION: Use the same differential pinion bearings and differential pinion bearing**

adjustment shim from the differential pinion bearing adjustment shim selection procedure for final assembly.

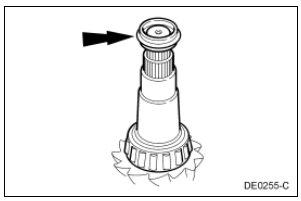
Position the differential pinion bearing adjustment shim and the inner pinion bearing on the differential pinion stem.

12. Using the special tools and a suitable press, firmly seat the differential pinion bearing adjustment shim and inner pinion bearing on the differential pinion stem.



13. ⚠ **CAUTION: Make sure the splines on the differential pinion stem are free of burrs. If burrs are evident, remove them using a fine crocus cloth.**

    Place a new drive pinion collapsible spacer on the differential pinion stem against the differential pinion stem shoulder.



14. Install the differential pinion gear with the drive pinion collapsible spacer in the differential housing.

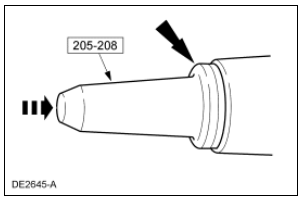
15. Install the outer pinion bearing and rear pinion oil seal slinger.

16. ⚠ **CAUTION: Installation without the correct tool can result in early rear pinion oil seal failure.**

    ⚠ **CAUTION: If the rear pinion oil seal becomes misaligned during installation, remove it and install a new one.**

    NOTE: Coat the rear pinion oil seal lips with Premium Long Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.

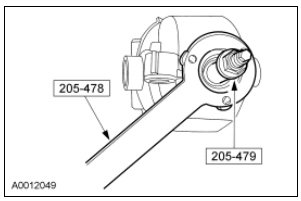
    Using the special tool, install the new rear pinion oil seal.



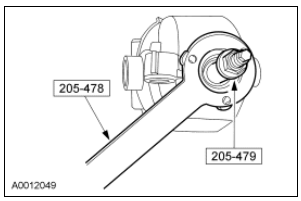
17. **NOTE:** Disregard the index marks if installing a new rear axle pinion flange.

    Position the rear axle pinion flange.

- Lubricate the rear axle pinion flange splines with Premium Long Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.
- Position the rear axle pinion flange.



18. Using the special tools, install the rear axle pinion flange.

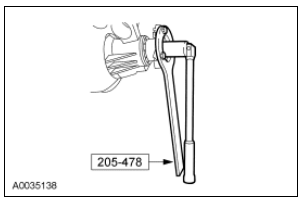


19. **⚠ CAUTION: Do not, under any circumstance, loosen the differential drive pinion nut to reduce differential pinion bearing preload. If it is necessary to reduce differential pinion bearing preload, install a new drive pinion collapsible spacer and differential drive pinion nut.**

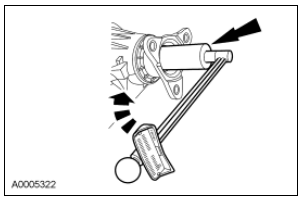
    ⚠ CAUTION: Remove the special tool while taking differential pinion bearing preload readings with the Nm (lb-in) torque wrench.

    Use the special tool to hold the rear axle pinion flange while tightening the differential drive pinion nut.

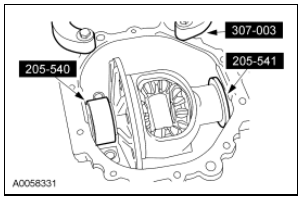
    - Rotate the differential pinion gear occasionally to make sure the differential pinion bearings seat correctly. Take frequent differential pinion bearing preload readings by rotating the differential pinion gear with a Nm (lb-in) torque wrench.



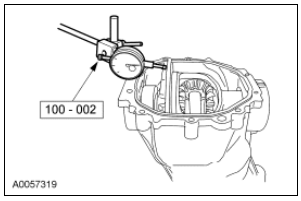
20. Tighten the differential drive pinion nut to set the differential pinion bearing preload.



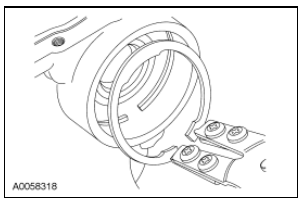
21. Install the special tools on the differential case.



22. Position the special tool on the differential case in the differential housing.



23. Install a unique set-up selective snap ring with a thickness of 2.54 mm (0.100 in).



24. **NOTE:** Repeat this step until obtaining a consistent reading.

    Measure the total end play.

    - Attach the special tools and position the indicator tip on the machined surface of the differential case flange.
    - Move the differential case to the left and the right (as far as possible).
    - Record the reading in Line A.

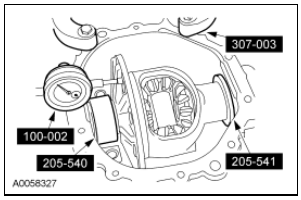
    Differential Bearing Shim Selection Chart

8.0 Inch Lightweight Axle	Example	Actual
Line A Total end play without ring gear	0.230	
Line B Total end play with ring gear	0.193	
Line C Subtract Line B from Line A	0.037	
Line D Initial backlash clearance	0.016	0.016
Line E Set-up snap ring thickness	0.100	0.100
Line F Left Master Bearing compensation	0.100	0.100
Line G Carrier bearing preload	0.012	0.012

    To determine the snap ring thickness, add lines C, D and E (Example: 0.037 + 0.016 + 0.100 = 0.153 snap ring thickness).

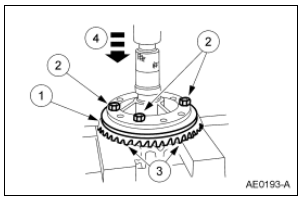
    To determine the bearing shim thickness, add lines A, F and G. Subtract line C and D from the sum. Example:

    - 0.230 + 0.100 + 0.012 = 0.342
    - 0.342 - 0.037 - 0.016 = 0.289 bearing shim thickness

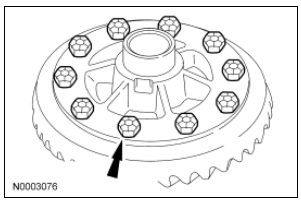


25. Remove the Dial Indicator and the differential case from the differential housing.

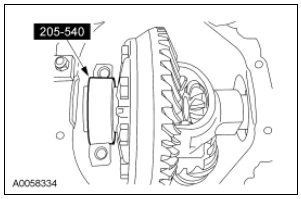
26. Install the differential ring gear.
    1. Place the differential ring gear on the differential case.
    2. Hand start 3 differential ring gear bolts to align the holes in the differential ring gear and the differential case.
    3. Place the differential case and differential ring gear onto the press bed blocks with the differential ring gear teeth facing downward.
    4. Press the differential ring gear into place.



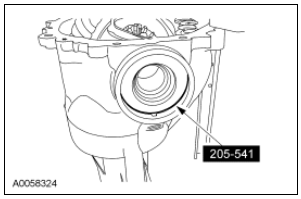
27. Install the remaining differential ring gear bolts.
    - Tighten to 120 Nm (89 lb-ft).



28. Place the differential case with the special tool into the differential housing.

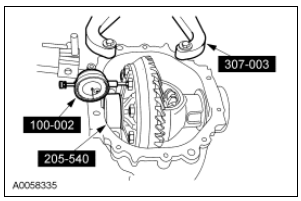


29. Install the special tool.

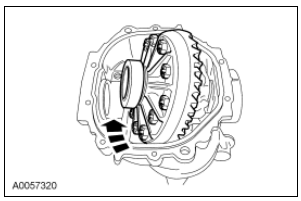


30. Measure the end play.
    - Attach the special tool and position the indicator tip on the machined surface of the differential case flange.
    - Rock the differential ring gear to allow full mesh with the drive pinion gear.
    - With the gears in full mesh, set the special tool to zero.

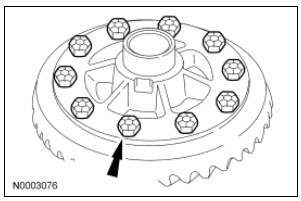
- Move the differential case as far as possible to the left and note the reading.
- Record the reading on the differential bearing shim selection procedure Line B.
  - ♦ Remove the special tool.



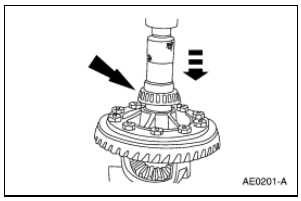
31. Remove the differential case from the differential housing.



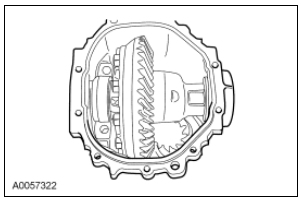
32. Remove the differential ring gear bolts. Apply Stud and Bearing Mount TA-27 meeting Ford specification WSK-M2G349-A1 to the differential ring gear bolt threads, and reinstall the differential ring gear bolts.
    - Tighten to 120 Nm (89 lb-ft).



33. Using a suitable press, press the differential bearings on the differential case.



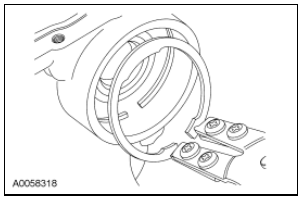
34. Place the differential case and differential bearing cups in the differential case.



35. **NOTE:** Select the correct size selective snap ring using the differential bearing shim selection chart.

    NOTE: To determine the thickness of the selective snap ring to be used, subtract Line B from Line A. Add Lines D and E to the difference. This is the thickness of the selective snap ring required.

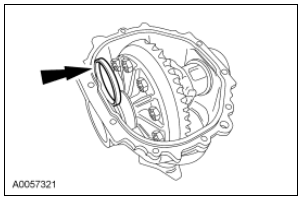
    Place the selective snap ring in the differential housing.



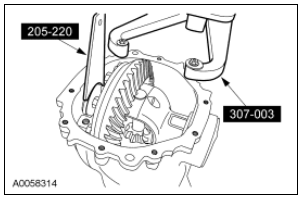
36. **NOTE:** Select the correct size selective bearing shim using the differential bearing shim selection chart.

    NOTE: To determine the thickness of the differential bearing shim to be used, add Lines A, F and G. Subtract Lines C and D from the sum. This is the thickness of the differential bearing shim required.

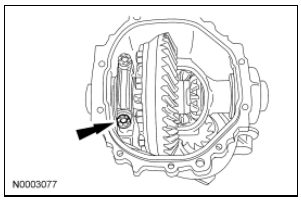
    Position the differential bearing shim indicated by the differential bearing shim selection chart.



37. Using the special tools, seat the differential bearing shim in the differential housing.

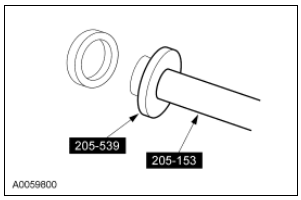


38. Install the differential bearing cap, then the differential bearing cap bolts in the original location.
    - Tighten to 105 Nm (77 lb-ft).



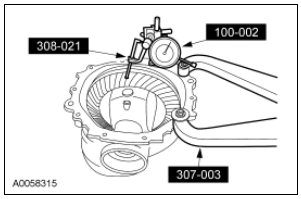
39. Lubricate the lips of the halfshaft housing seal.
    - Use Premium Long-Life Grease XG-1-C meeting Ford specification ESA-M1C75-B.

40. Using the special tools, install the halfshaft housing seal.



41. Using the special tools, measure the differential ring gear backlash at 4 equally spaced points.
    - Attach the special tool.
    - Position the special tool tip centrally on a drive tooth.
    - Zero the indicator.

- Turn the differential ring gear without turning the differential pinion gear. Record the indicator reading. The allowable backlash is 0.127 mm (0.005 in) to 0.228 mm (0.009 in) and must not vary more than 0.076 mm (0.003 in) between points measured. A backlash variation of more than 0.076 mm (0.003 in) between points checked indicates gear/case runout.
  - ♦ If backlash is within specifications, install the axle assembly.
  - ♦ To correct for a high or low backlash, proceed as follows.



42. To correct for high or low backlash, increase or decrease the thickness of the differential bearing shim and decrease or increase the thickness of the selective snap ring by the same amount. Refer to the following tables when adjusting the backlash. When the backlash is within specifications, install the differential assembly.

Backlash Change Required		Thickness Change Required	
mm	**in**	**mm**	**in**

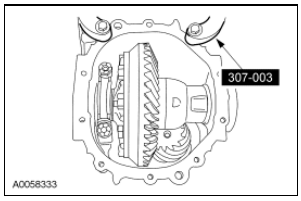
43. Remove the differential assembly from the special tool.



44. **⚠ CAUTION: The differential housing cover must be installed within 15 minutes of application of the Silicone Gasket and Sealant F7AZ-19554-EA meeting Ford specification WSE-M4G323-A4.**

    ⚠ CAUTION: Allow the Silicone Gasket and Sealant to cure for 1 hour before filling the axle with lubricant.

    Apply a continuous bead of Silicone Gasket and Sealant to the differential housing cover mounting surface, then install the differential housing cover.

45. Install the rear axle assembly. For additional information, refer to Axle Assembly in this section.

46. Fill the axle.
    - Use High Performance Rear Axle Lubricant XY-75W140-QL meeting Ford specification WSL-M2C192-A to 3-5 mm (1/8-3/16 in) from the bottom of the filler hole.
    - Tighten to 34 Nm (25 lb-ft).

Printable View (7 KB)

Torque Specifications

Description	Nm	lb-ft
Rear axle wheel hub retainer	300	221
Suspension lower arm bolt	150	111
Toe-link bolt	55	41
Rear caliper bracket bolt	103	76
Anti-lock sensor bolt	7	5

Rear Drive Halfshafts

Printable View (11 KB)

⚠ CAUTION: An inspection of the outer and inner boots is necessary so that if damage or grease leakage is evident, installation of a new halfshaft can take place immediately. Continued operation with damage or grease leakage will result in CV joint wear and noise due to contamination and loss of the CV joint grease.

- The RH and LH halfshafts are different lengths, with the RH halfshaft being the longer of the two.
- Inboard and outboard CV joints connect to a splined shaft. A circlip stopper holds the cross groove inboard race assembly (inboard CV joint) together.
- An axle circlip retains the splined inboard CV joint to the differential side gear. Install a new axle circlip every time you remove the halfshaft from the vehicle.
- A rear axle wheel hub retainer secures the side shaft assembly (interconnecting shaft and outboard CV joint) to the rear hub. Install a new rear axle wheel hub retainer every time you remove the halfshaft from the vehicle.

Halfshaft Handling

⚠ CAUTION: Never pick up or hold the halfshaft only by the inboard or outboard CV joint.

Handle all halfshaft components carefully during removal and installation procedures.

- The halfshaft assemblies are not repairable. Install a new assembly if worn/damaged.
- To separate the halfshaft from the rear hub, press the outboard CV joint from the rear hub.
- To separate the halfshaft from the differential, apply a load to the back face of the inboard CV joint assembly to overcome the axle circlip.
- Do not over-angle the CV joints.
- Damage will occur to an assembled inboard CV joint if it is over-plunged outward from the joint housing.
- Never use a hammer to remove or install the halfshafts.
- Never use the halfshaft assembly as a lever to position other components. Always support the free end of the halfshaft.
- Do not allow the boots to contact sharp edges or hot exhaust components.
- Handle the halfshaft only by the interconnecting shaft to avoid pull-apart and potential damage to the CV joints.
- Do not drop assembled halfshafts. The impact will cut the boots from the inside without evidence of external damage.

Wheel and Tire Balancing, Rear

⚠ WARNING: Do not balance the rear wheels and tires while mounted on the vehicle. Possible tire disintegration, differential or halfshaft failure can result, causing personal injury or extensive component damage. Use an off-vehicle wheel and tire balancer only.

Hoisting

⚠ CAUTION: Use a frame-contact hoist only. Vehicle or component damage can result if other types of hoists are used.

Never raise the vehicle using the halfshafts as lift points.

Rear Drive Halfshafts

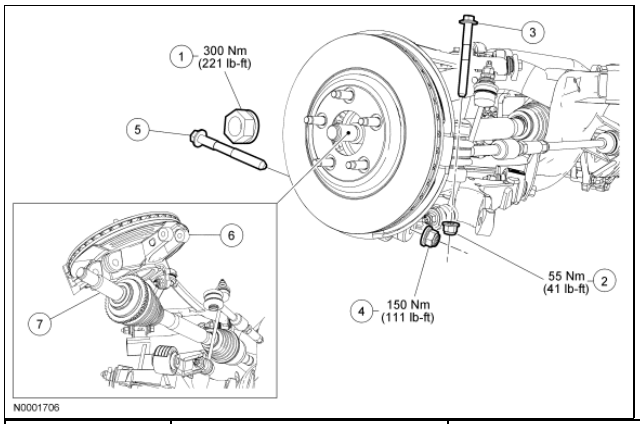
Halfshaft

Printable View (462 KB)

Special Tool(s)

ST1712-A	Differential Plug 205-294 (T89P-4850-B)
	Protector, Differential Seal 205-506
ST2309-A	Halfshaft Removal Tool 205-475
ST1516-A	Hub Remover/Replacer 204-069 (T81P-1104-C)
ST1517-A	Metric Hub Remover Adapter 205-237 (T86P-1104-A1)
ST1518-A	Metric Hub Remover Adapters 204-085 (T83P-1104-BH)



Item	Part Number	Description
1	4B423	Rear axle wheel hub retainer
2	W520213-S	Toe link nut
3	W705517-S	Toe link bolt
4	W705518-S	Suspension lower arm nut
5	W705516-S	Suspension lower arm bolt
6	3K185	Rear wheel knuckle assembly
7	3514	Rear halfshaft assembly

Removal

1. ⚠ **CAUTION: Do not begin this procedure unless:**

- a new rear axle wheel hub retainer is available.
- a new axle circlip is available.
- you have read Halfshaft Handling in this section.

With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

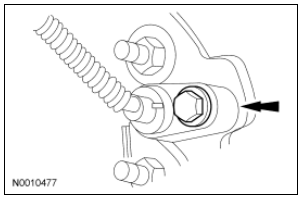
2. Remove the rear wheel and tire assembly. For additional information, refer to Section 204-04 .

3. Remove and discard the rear axle wheel hub retainer.

4. **⚠ CAUTION: When removing the caliper, never allow it to hang from the brake hose. Provide a suitable support.**

   Remove the rear brake caliper and support bracket as an assembly.

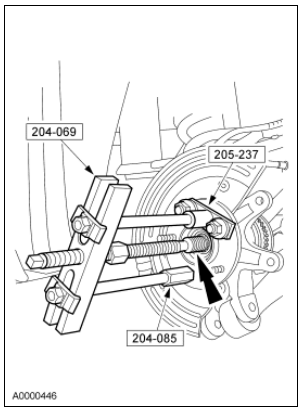
5. Remove the rear anti-lock speed sensor from the hub.



6. Remove and discard the suspension lower arm nut and bolt.

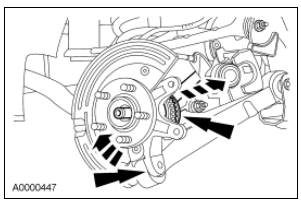
7. Remove the toe-link nut and bolt.

8. Using the special tools, press the outboard CV joint until it is loose in the hub.

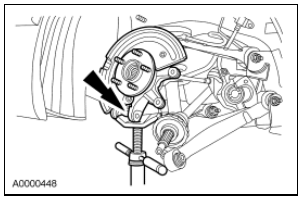


9. **⚠ CAUTION: Do not over-angulate the outboard CV joint or damage the boot.**

   While raising the knuckle, remove the CV joint from the hub.

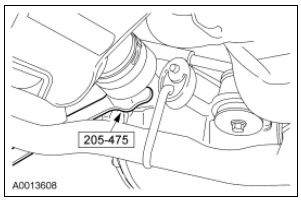


10. Position the knuckle to gain clear access for the halfshaft removal.



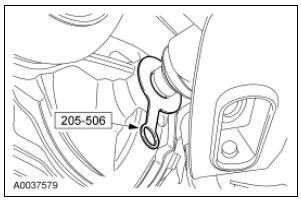
11. ⚠ **CAUTION: The crown of the tool forks must face away from the axle housing. Position the special tool correctly between the CV joint and the axle housing so as not to damage the differential seal.**

    Using the special tool, exert enough pressure to overcome the axle circlip and separate the CV joint from the differential side gear.

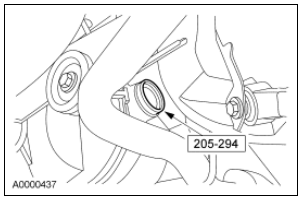


12. ⚠ **CAUTION: To prevent damage to the axle shaft oil seal, install the special tool before removing the inboard CV joint housing from the axle.**

    Install the special tool.



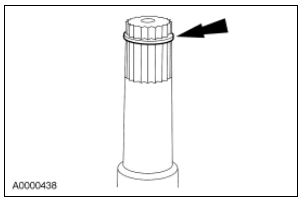
13. Install the special tool.



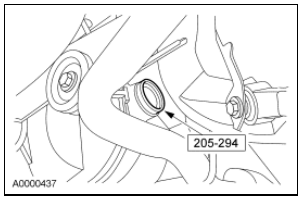
Installation

1. **NOTE:** This procedure applies to both the LH and RH halfshafts.

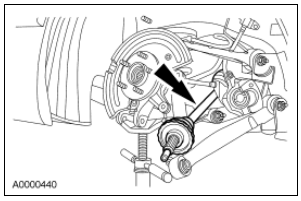
   Install a new axle circlip.



2. Remove the special tool.

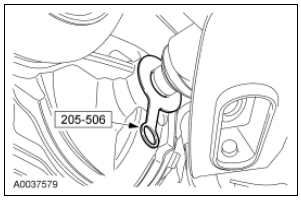


3. Position the halfshaft for installation.

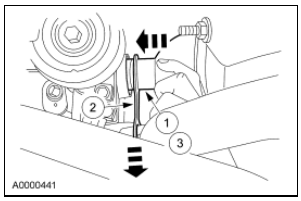


4. ⚠ **CAUTION: Differential seal damage will occur if installing the halfshaft without the special tool installed.**

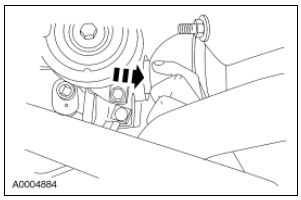
   Install the special tool.



5. Seat the CV joint in the differential side gear.
   1. Slide the CV joint into the axle housing until the shaft splines are past the differential seal.
   2. Remove the special tool.
   3. Align the CV joint and side gear splines, and slide the joint into the gear until it seats.
      - ♦ When seated, the axle circlip will lock the CV joint in the differential side gear.

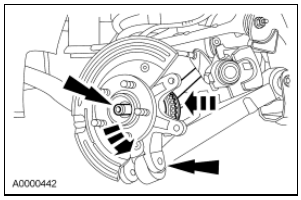


6. Check the axle circlip engagement by attempting to pull the inboard CV joint out of the differential side gear.
   - If the circlip is not seated, push the CV joint inward until the circlip is fully engaged in the differential side gear.



7. ⚠ **CAUTION: Do not over-angulate the outboard CV joint or damage the boot.**

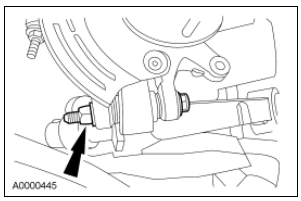
   While raising the knuckle, install the CV joint into the hub, then position the knuckle onto the lower control arm.



8. ⚠ **CAUTION: Position the suspension at curb ride height before tightening the bolt and nut.**

   Install the new suspension lower arm bolt and nut.

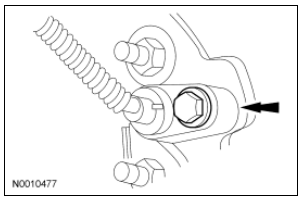
   - Tighten to 150 Nm (111 lb-ft).



9. Install the toe-link nut and bolt.
   - Tighten to 55 Nm (41 lb-ft).

10. Install the rear brake caliper and bracket and the bolts.
    - Tighten to 103 Nm (76 lb-ft).

11. Install the rear brake anti-lock sensor and the bolt.
    - Tighten to 7 Nm (5 lb-ft).



12. Install the new rear axle wheel hub retainer.
    - Tighten to 300 Nm (221 lb-ft).

13. Install the rear wheel and tire assembly. For additional information, refer to Section 204-04 .

Brake System

Printable View (16 KB)

The brake system consists of the following components:

- a vacuum-assisted power braking system
- a power adjustable brake pedal with memory function (if equipped)
- a diagonal split hydraulic system
- front disc brakes utilizing a dual piston brake caliper and disc system
- rear disc brakes utilizing a single piston brake caliper and disc system
- an electronic parking brake (EPB) system that actuates an integral system within the rear brake discs
- a 4-wheel anti-lock brake system (ABS) available in 2 variants: ABS with Traction Control or ABS with Traction Control and Stability Assist (also referred to as Interactive Vehicle Dynamics [IVD] or Advance Trac). For additional information, refer to Section 206-09 .

Adjustable Pedals

The vehicle may be equipped with an adjustable brake and accelerator pedal system. Using the adjustable pedal switch, located on the instrument panel, the driver can adjust the brake and accelerator pedals for a more comfortable driving position.

Memory Adjustable Pedal Operation

The power adjustable pedals memory feature stores the current accelerator and brake pedal positions and recalls the previously stored pedal positions for a specified driver as directed by the memory feature. The adjustable pedals with memory feature:

- are operational with the ignition switch in the ON or OFF position.
- can be adjusted forward or rearward using the adjustable pedal switch.
- retains 2 separate driver's pedal positions.
- updates the retained pedal position when that driver's memory is stored.
- moves the pedal to the retained pedal position when that driver's memory is recalled.
- stops pedal movement when any manual actuation of the pedal adjustment switch occurs while memory recall is moving the pedal.

Programming Adjustable Pedal Positions

Programming adjustable pedal positions can be accomplished by doing the following:

- An adjustable pedal position can be stored at any time. To store the adjustable pedal position to memory, the driver must move the pedals to the preferred position using the adjustable pedal switch. The driver must then press the memory SET switch, activating the memory SET switch light emitting diode (LED). Within 5 seconds (before the LED goes out) the driver must select memory position No.1 or No.2.
- If no memory switch input is received within the 5-second time limit, the operation is aborted and the memory SET switch LED is turned OFF. If one of the following inputs is received during the 5-second programming limit, the operation is aborted and the memory SET switch LED is turned OFF:
    - ♦ Adjustable pedal switch

- Power driver seat switch
- Power outside rearview mirrors switch
- Memory SET switch.

Recalling a Stored Adjustable Pedal Position

Once the driver has stored a preferred adjustable pedal position, the driver can recall the setting by pressing the corresponding memory switch, or by using a programmed remote keyless entry transmitter. Recalling a stored adjustable pedal position can be accomplished by doing the following:

- The driver can recall a preferred adjustable pedal position by pressing one of the memory recall switches. Pressing memory switch 1 initiates a recall of the adjustable pedal position stored in memory No.1. Pressing memory switch 2 initiates a recall of the adjustable pedal position stored in memory No.2.
- A remote keyless entry transmitter can be used to recall previously set memory positions. The remote keyless entry transmitters are manufactured with an assigned personality number (No.1 or No.2). The remote keyless entry transmitter assigned with personality No.1 is capable of recalling only memory position No.1. Similarly, the remote keyless entry transmitters assigned with personalities No.1 and No.2 can recall memory positions No.1 and No.2 respectively.
- Memory recall occurs when the UNLOCK switch is pressed on the remote keyless entry transmitters. A second press of the UNLOCK switch, which unlocks the passenger doors, does not initiate a memory recall.
- A memory recall in progress does not prohibit the initiation of another memory recall; the most recently requested memory recall is executed. For additional memory system information, refer to Section 501-10 .

Electronic Parking Brake (EPB)

The electronic parking brake (EPB) replaces the function of the conventional hand brake lever system. The EPB has 2 functions. Its primary function is to hold the vehicle up to a 30% grade. The secondary function is to be able to decelerate the vehicle by using the EPB as an emergency brake.

The EPB system:

- has a switch located in the front console behind the gear selector. The switch is hardwired to the EPB module. It includes a yellow fault warning lamp.
- has a control module that communicates with the other vehicle modules through the SCP network.
- uses an electric motor and gearbox assembly to apply and release tension on a conventional parking brake cable system.

Electronic Parking Brake (EPB) Operation

Pull the parking brake switch upward to engage the parking brake. Release the switch, and it returns to the neutral position. To release the parking brake, make sure the ignition is turned to ON, press the brake pedal, then push the parking brake switch down. The instrument cluster BRAKE warning lamp illuminates and remains illuminated until the parking brake is released.

The EPB will automatically release when the gearshift lever is moved from P (Park) with the ignition ON. The EPB also disengages if a gear is selected and the accelerator pedal is pressed. The EPB will not release when the release switch is activated. If the battery is disconnected, the EPB system must be reset; the vehicle message center will display "APPLY PARK BRAKE" or "APPLY ((P))".

Electronic Parking Brake (EPB) Resetting

NOTE: The EPB can be released after the battery is reconnected.

The EPB system must be reset whenever the battery has been disconnected or has been in a state of discharge.

To reset the EPB system, follow the steps:

1. Place gearshift selector in the park (P) position.
2. Turn the ignition switch ON.
3. Press the brake pedal and at the same time pull on the EPB switch.
4. Then release the EPB switch. To release the EPB switch, push on the EPB switch while depressing the brake pedal.

 ST2032-A	On-Car Brake Lathe 201-00002 or equivalent

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A
Silicone Brake Caliper Grease and Dielectric Compound XG-3	ESE-M1C171-A
Brake Parts Cleaner PM-4	

Inspection and Verification

⚠ WARNING: Use of any brake fluid other than the approved DOT 3 will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Do not spill brake fluid onto painted surfaces. If spilled, wipe up immediately.

NOTE: Always check the fluid level in the brake master cylinder reservoir before carrying out the test procedures. If the fluid level is not at the correct level, clean the reservoir cap before removing, then add DOT 3 brake fluid.

NOTE: Prior to carrying out any diagnosis, make sure the red brake warning indicator is functional. For additional information, refer to Section Section 413-01 .

The first indication that something may be wrong in the brake system is a change in the feeling through the brake pedal. The brake warning indicator in the instrument cluster and the brake fluid level in the brake master cylinder reservoir are also indicators of system concerns.

If a wheel is locked and the vehicle must be moved, open a bleeder screw at the locked wheel to let out enough fluid to relieve the pressure. Close the bleeder screw. This bleeding operation may release the brakes but does not correct the cause of the concern. If this does not relieve the locked wheel condition, repair the locked components before proceeding.

Inspect all the hoses and connections. All unused vacuum connectors should be capped. Make sure the hoses and their connections are correctly secured and in good condition with no holes, or soft or collapsed areas.

Road Test

The technician should have a thorough knowledge of the brake system operation and accepted general braking guidelines in order to detect any problems.

Select a road that is reasonably smooth and level. Gravel or bumpy roads are not suitable because the surface does not allow the tires to grip the road equally. Avoid crowned roads.

A key factor in evaluating brake concerns is the deceleration rate. This varies from vehicle to vehicle and with changes in operating conditions. It is evident how well the brakes are working after just a few applications.

For low or spongy brake pedal concerns:

- check and, if necessary, refill the brake master cylinder reservoir.
- bleed the brake system and retest the brake pedal feel.
- if the brake pedal is still low or feels spongy, check the brake pedal mounting for looseness and correct installation. Check the brake booster and the brake master cylinder for loose mounting. Correct as necessary and retest the system for normal operation.

For a slow or incomplete brake pedal return concern:

- inspect for binding, damage, correct installation, or interference at the brake pedal.
- check the brake booster for binding, damage, and correct installation.

Brake Pads

NOTE: It is not necessary to install new brake pads if the friction material properties are within specification. It is also not necessary to install new brake pads when the brake discs are machined.

- Remove the brake pads. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

- Inspect and measure the thickness of the brake pad friction material.
    - Install new brake pads if the thickness of the friction material is less than 3.0 mm (0.118 inch). For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - Compare all 4 front or rear pads for uneven wear. Install new brake pads if the thickness of the friction material varies from pad to pad by more than 2.0 mm (0.079 inch). For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - Install new brake pads if there are missing chunks or cracks in the lining through to the backing plate. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - If the friction material shows taper wear (i.e. the thickness varies by more than 3.0 mm [0.118 inch] in any direction) verify the caliper guide pins are functioning correctly. For additional information, refer to Brake Caliper Guide Pins in this section.

Brake Discs

⚠ CAUTION: Using an impact tool without a torque socket leads to unevenly tightened lug nuts. This causes brake disc on-vehicle lateral runout and brake roughness.

NOTE: It is generally not necessary to install new brake discs to address brake noise concerns.

- Remove the brake disc. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Inspect the brake disc and measure the brake disc thickness in a minimum of 4 places around the circumference of the brake disc. Record the measurements.
    - Install new brake discs if any thickness measurement is less than the minimum specification. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - Install new brake discs if cracked. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
    - Machine the brake discs if the diagnosis has revealed vibration in the steering wheel, seat, or pedal while braking. Heavily scored brake discs, similar to that caused by pads worn down to the backing plate, should also be machined. In order to machine, the thickness of the discs must be greater than the minimum thickness to machine specification. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

Brake Caliper

Inspect the brake calipers for the following:

- brake fluid leaks
- tears or cracks in the boots and seals
- binding and corrosion of the caliper piston
- correct operation of the guide pins. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

Brake Caliper Guide Pins

⚠ CAUTION: Do not use power tools for caliper guide pin bore cleaning.

The guide pins should slide with a reasonable amount of hand force. If the brake pads show taper wear or the guide pins are difficult to move, carry out the following steps:

NOTE: If a guide pin kit is not available, install a new brake caliper assembly.

- Disassemble the guide pins. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Use a wire brush, rolled-up sandpaper, or emery cloth to remove all corrosion and foreign material from the caliper guide pin bores. Clean any remaining debris from the bores with brake parts cleaner and compressed air.
- Install new brake pads if the lining is not within specification. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.
- Assemble the caliper guide pins using new caliper seals, boots, and guide pins. Use an ample amount of grease to lubricate the bores and guide pins.

Brake Lines and Tubes

⚠ CAUTION: Never use copper tubing. It is subject to fatigue, cracking, and corrosion which could result in brake tube failure.

- Double-wall steel tubing is used throughout the brake hydraulic system. All brake tube fittings must be correctly double flared to provide strong, leakproof connections. When bending tubing to fit the underbody or rear axle contours, be careful not to kink or crack the tube.
- If a section of the brake tube is damaged, the entire section must be installed new with a tube of the same type, size, shape, and length.
- When installing the hydraulic brake tubing, hoses, or connectors, tighten all connections to specification. After installation, bleed the brake system. For additional information, refer to Brake System Bleeding in this section.
- The wet appearance on the outer cover of rubber brake hoses is called "sweating." This is a normal condition for neoprene rayon braided hose and is not a sign of leakage or cause to install a new hose.

Install a new flexible brake hose if the hose shows signs of softening, cracking, or other damage.

When installing a new brake hose, position the hose to avoid contact with other vehicle components.

Non-Pressure Leaks

NOTE: The wet appearance on the outer cover of rubber brake hoses is called "sweating." This is a normal condition for neoprene rayon braided hose. The sweating condition is not evidence of a brake fluid leak and will not result in a loss of pressure in the system.

The only part of the brake system that could have a brake fluid loss that does not appear when the system is under pressure is the brake master cylinder reservoir under the following conditions:

- missing or poorly-fitted brake master cylinder filler cap
- punctured or otherwise damaged brake master cylinder reservoir
- missing or damaged brake master cylinder filler cap gasket
- missing, damaged, or poorly-fitted sealing grommets between the brake master cylinder and the brake master cylinder reservoir

The brake master cylinder reservoir grommets are not repairable and must be installed new as part of a new brake master cylinder reservoir.

Brake Master Cylinder Normal Conditions

The following conditions are considered normal and are not indications that the brake master cylinder is in need of service:

Condition 1: During normal operation of the brake master cylinder, the fluid level in the brake master cylinder reservoir rises during brake application and falls during release. The net fluid level (such as after brake application and release) will remain unchanged.

Condition 2: A trace of brake fluid exists on the booster shell below the master cylinder mounting flange. This results from the normal lubricating action of the master cylinder bore and seal.

Condition 3: The fluid level decreases with pad wear.

Brake Master Cylinder Abnormal Conditions

Changes in the brake pedal feel or travel are indicators that something could be wrong in the brake system. GO to Symptom Chart for abnormal condition diagnosis.

Brake Booster

Inspect the brake booster for the following:

- excessive corrosion or damage
- leakage in the vacuum connections
- kinks or leakage in the vacuum hoses
- correct operation of the brake booster check valve

Changes in the brake pedal feel or travel are indicators that something could be wrong in the brake system. GO to Symptom Chart for abnormal condition diagnosis.

Adjustable Pedals

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
• Adjustable pedals • Adjustable pedal motor and cables	• Adjustable pedal switch • Central junction box (CJB) fuse 30 (10A) • Wiring harness • Circuitry

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. If the diagnostic tool does not power up, refer to the diagnostic tool manual.

5. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP, UBP, CAN or ISO circuit faults; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for front electronic module (FEM), refer to Section 419-10 .
   - System passed, retrieve and record the continuous DTCs and the carry out self-test diagnostics for the FEM.

6. If the DTCs retrieved are related to the concern, go to the Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index.

7. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

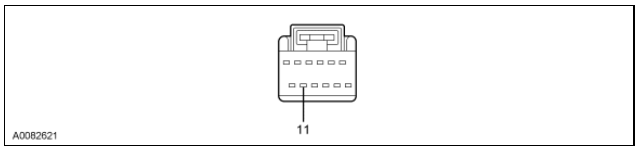
Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU Defective	FEM	INSTALL a new FEM. REFER to Section 419-10 .
B1990	Pedal Forward/Rearward Potentiometer Feedback Circuit Failure	FEM	Go To Pinpoint Test D .
B2358	Adjustable Pedal Switch Failure	FEM	Go To Pinpoint Test B .

Symptom Chart

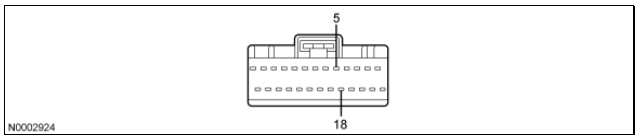
Symptom Chart
Connector Reference and Terminal Readings

Front Electronic Module (FEM) C201c



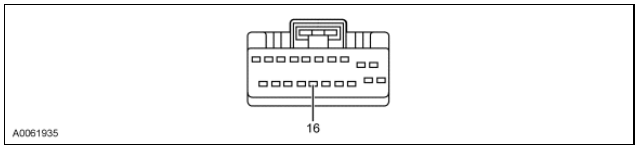
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
11	8-GC7 (WH/RD) brake fluid level sensor output circuit	Greater than 10 volts with the ignition switch in the ON position.

Front Electronic Module (FEM) C201e



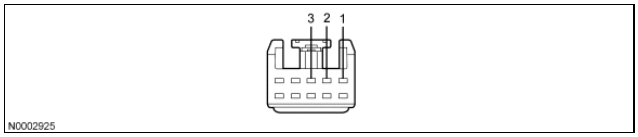
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
5	8-AL18 (WH/RD) pedal position feedback circuit (the FEM uses the signal to recall the pedal position from memory)	Voltage varies with the pedal position, continuity between the FEM and the adjustable pedal motor.
18	9-AL18 (BN/RD) adjustable pedal potentiometer signal ground to the FEM, (-), and diagnostic feedback circuit	Resistance between 3,600 and 5,400 ohms, 0 volts when connected.

Front Electronic Module (FEM) C201f



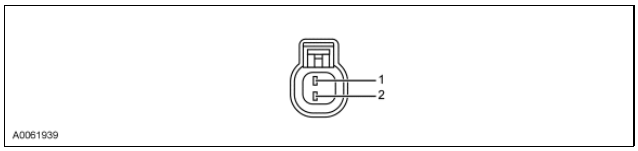
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
16	7-AL18 (YE/RD) adjustable pedal potentiometer (+)	10 volt reference applied to the adjustable pedal potentiometer, continuity between the adjustable pedal motor and the FEM.

Adjustable Brake Pedal Potentiometer C268



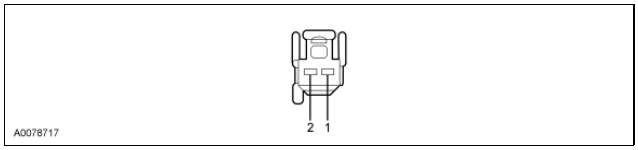
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	9-AL18 (BN/RD) adjustable pedal potentiometer signal ground (-) and diagnostic feedback circuit	Resistance between 3,600 and 5,400 ohms, 0 volts when connected.
2	8-AL18 (WH/RD) pedal position feedback circuit (the front electronic module (FEM) uses the signal to recall the pedal position from memory)	Voltage varies with the pedal position, continuity between the FEM and the adjustable pedal motor.
3	7-AL18 (YE/RD) adjustable pedal potentiometer (+)	10 volt reference applied to the adjustable pedal potentiometer, continuity between the adjustable pedal motor and the FEM.

Brake Fluid Level Switch C1395



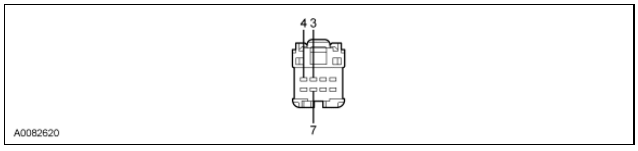
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	8-GC7 (WH/RD) brake fluid level switch signal return to the instrument cluster	Continuity between the brake fluid level indicator switch and the instrument cluster.
2	31-GC7 (BK/BU) ground circuit for the brake indicator lamp when the parking brake switch is closed	Continuity between the switch and ground, less than 5 ohms to ground when the switch is closed.

Adjustable Pedal Motor C2003



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	34-AL18 (BU/RD) adjustable pedal motor power feed or ground (switched)	Greater than 10 volts with the motor in one direction and ground when in the opposite direction. Less than 5 ohms between the adjustable pedal switch and the adjustable pedal motor connectors (both disconnected).
2	35-AL18 (VT/BU) adjustable pedal motor ground or power feed (switched)	Greater than 10 volts with the motor in one direction and ground when in the opposite direction. Less than 5 ohms between the adjustable pedal switch and the adjustable pedal motor connectors (both disconnected).

Adjustable Pedal Switch C2089



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	32-AL19 (WH/GN) ground input to the FEM, moves pedal away from the driver	0 volts and less than 5 ohms to ground, continuity between the switch and the FEM.
4	31-AL19A (BK/GN) switch common ground	0 volts and less than 5 ohms to ground.
7	34-AL19 (BU/BK) ground input to the FEM, moves the pedal toward the driver	0 volts and less than 5 ohms to ground, continuity between the switch and the FEM.

Pinpoint Tests

Pinpoint Test A: The Red Brake Warning Indicator Lamp Is Always On

Normal Operation

The red brake warning indicator is located on the instrument cluster. When the brake fluid in the brake master cylinder reservoir is less than an acceptable level, and when the parking brake is engaged, the red brake warning indicator illuminates.

Possible Causes

- low brake fluid level
- parking brake engaged
- circuit 31-CG7 (BK/BU) open
- circuit 8-GC7 (WH/RD) open or short to ground
- low brake fluid level switch
- front electronics module (FEM)
- instrument cluster

PINPOINT TEST A: THE RED BRAKE WARNING INDICATOR IS ALWAYS ON

Test Step	Result / Action to Take
A1 ISOLATE THE BRAKE FLUID LEVEL SWITCH	
• Key in OFF position. • Disconnect: Brake Fluid Level Switch C1395. • Key in ON position. • Monitor the brake warning indicator. • **Is the brake warning indicator lamp on?**	**Yes** GO to A2 . **No** INSTALL a new brake fluid level switch. TEST the system for normal operation.
A2 CHECK CIRCUIT 8-GC7 (WH/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: front electronic module (FEM) C201c. • Measure the resistance between the brake fluid level switch C1395-1, circuit 8-GC7 (WH/RD), harness side and ground.  N0002863 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK CIRCUIT 8-GC7 (WH/RD) FOR AN OPEN	

• Measure the resistance between the FEM C201c-11, circuit 8-GC7 (WH/RD), harness side and the brake fluid level switch C1395-1, circuit 8-GC7 (WH/RD), harness side.  N0002986 • **Is the resistance less than 5 ohms?**	**Yes** GO to A4 . **No** REPAIR the circuit. TEST the system for normal operation.
A4 CHECK CIRCUIT 31-GC7 (BK/BU) FOR AN OPEN	
• Measure the resistance between the brake fluid level switch C1395-2, circuit 31-GC7 (BK/BU), harness side and ground.  N0002865 • **Is the resistance less than 5 ohms?**	**Yes** REFER to Section 206-05 to diagnose the parking brake. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test B: DTC B2358: Adjustable Pedal Switch Failure

Refer to Wiring Diagrams Cell 127 for schematic and connector information.

Normal Operation

The adjustable brake and accelerator pedals with memory feature are controlled by the front electronic module (FEM) and are operational with the ignition switch ON or OFF. The FEM supplies voltage to the adjustable pedal 2-way motor until the switch is released or until the travel limit is reached. The memory feature allows the driver to program a personalized pedal position that can be recalled using the memory switches or the remote keyless entry (RKE) transmitters.

Possible Causes

- adjustable pedal switch
- circuit 31-AL19A (BK/GN) open

PINPOINT TEST B: DTC B2358: ADJUSTABLE PEDAL SWITCH FAILURE

Test Step	Result / Action to Take
B1 CHECK THE ADJUSTABLE PEDAL SWITCH REARWARD	
• Disconnect: Adjustable Pedal Switch C2089. • Press the adjustable pedal switch REARWARD and measure the resistance between the adjustable pedal switch C2089-3, circuit 32-AL19 (WH/GN), component side, and	**Yes** GO to B2 . **No** INSTALL a new adjustable pedal

C2089-4, circuit 31-AL19A (BK/GN), component side.  N0002866 • **Is the resistance less than 5 ohms?**	switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B2 CHECK THE ADJUSTABLE PEDAL SWITCH FORWARD	
• Press the adjustable pedal switch FORWARD and measure the resistance between the adjustable pedal switch C2089-7, circuit 34-AL19 (BU/BK), component side, and C2089-4, circuit 31-AL19A (BK/GN), component side.  N0002867 • **Is the resistance less than 5 ohms?**	**Yes** GO to B3 . **No** INSTALL a new adjustable pedal switch. CLEAR the DTCs. REPEAT the self-test. TEST the system for normal operation.
B3 CHECK CIRCUIT 31-AL19A (BK/GN) FOR AN OPEN	
• Measure the resistance between the adjustable pedal switch C2089-4, circuit 31-AL19A (BK/GN), harness side, and ground.  N0002868 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new adjustable pedal switch. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Adjustable Pedal Does Not Operate Correctly

Refer to Wiring Diagrams Cell 127 for schematic and connector information.

Normal Operation

The adjustable brake pedals operate forward or rearward when the adjustable pedal switch is pushed in either direction and current flows from the front electronic module (FEM) through circuit 34-AL19 (BU/BK) or circuit 32-AL19 (WH/GN). Ground to the switch is supplied by circuit 31-AL19A (BK/GN). The adjustable pedal motor receives voltage from the FEM through circuit 34-AL18 (BU/RD) (rearward) or circuit 35-AL18 (VT/BU (forward). The adjustable motor connects to a cable that transmits motor rotation to the adjustable brake pedal assembly. Another cable transmits motor rotation between the brake pedal assembly and the accelerator pedal assembly.

Possible Causes

- adjustable pedal motor
- circuit 32-AL19 (WH/GN) open, short to ground, or short to voltage
- circuit 34-AL19 (BU/BK) open, short to ground, or short to voltage
- circuit 31-AL19A (BK/GN) open
- circuit 34-AL18 (BU/RD) open
- circuit 35-AL18 (VT/BU) open
- adjustable pedal motor cables
- adjustable pedal switch

PINPOINT TEST C: THE ADJUSTABLE PEDAL DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
C1 CHECK THE MOTOR SOUND	
• Allow 2 minutes for the thermal overload to reset. • Operate the adjustable pedal control switch. • **Can the adjustable pedal motor be heard to operate?**	**Yes** GO to C2 . **No** GO to C6 .
C2 CHECK THE MOTOR INSTALLATION	
• Check the adjustable pedal motor for correct installation. • **Is the motor installation OK?**	**Yes** GO to C3 . **No** INSTALL the motor correctly. TEST the system for normal operation.
C3 CHECK THE ADJUSTABLE ACCELERATOR PEDAL SYSTEM	
• Disconnect the brake pedal-to-accelerator pedal cable. • Operate the adjustable pedal control switch. • **Does the adjustable brake pedal operate now?**	**Yes** REPAIR the adjustable accelerator pedal system. REFER to Section 310-02 . TEST the system for normal operation. **No** GO to C4 .
C4 INSPECT FOR FOREIGN MATERIAL	
• Inspect the adjustable brake pedal assembly for foreign material causing a binding condition. • **Is any foreign material found?**	**Yes** REMOVE the foreign material. TEST the system for normal operation. **No** GO to C5 .
C5 CHECK THE BRAKE PEDAL MOTOR CABLE	
• Remove the adjustable pedal motor. For additional information, refer to Section 206-06 .	**Yes** GO to C6 .

• Inspect the ends of the brake pedal motor cable for wear or damage. • **Are the cable ends OK?**	**No** INSTALL a new brake pedal motor cable. REFER to Section 206-06 . TEST the system for normal operation.
C6 CHECK FOR VOLTAGE TO THE ADJUSTABLE PEDAL SWITCH	
• Disconnect: Adjustable Pedal Switch C2089. • Measure the voltage between the adjustable pedal switch C2089-3, circuit 32-AL19 (WH/GN), harness side and ground; and between the adjustable pedal switch C2089-7, circuit 34-AL19 (BU/BK), harness side and ground.  N0002869 • **Is the voltage greater than 10 volts?**	**Yes** GO to C7 . **No** REPAIR circuit in question. TEST the system for normal operation.
C7 CHECK THE GROUND TO THE ADJUSTABLE PEDAL SWITCH	
• Measure the resistance between the adjustable pedal switch C2089-4, circuit 31-AL19A (BK/GN), harness side and ground.  N0002870 • **Is the resistance less than 5 ohms?**	**Yes** GO to C8 . **No** REPAIR the circuit. TEST the system for normal operation.
C8 CHECK THE CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: FEM C201b. • Measure the voltage between the adjustable pedal switch C2089-3, circuit 32-AL19 (WH/GN), harness side and ground; and between the adjustable pedal switch C2089-7, circuit 34-AL19 (BU/BK), harness side and ground.  N0002869 • **Is any voltage present?**	**Yes** REPAIR the circuit(s) in question. TEST the system for normal operation. **No** GO to C9 .
C9 CHECK THE CIRCUITS FOR A SHORT TO GROUND	

• Measure the resistance between the adjustable pedal switch C2089-3 , circuit 32-AL19 (WH/GN), harness side and ground; and between the adjustable pedal switch C2089-7, circuit 34-AL19 (BU/BK), harness side and ground.  N0002871 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C10 . **No** REPAIR the circuit. TEST the system for normal operation.
C10 CHECK THE SWITCH-TO-MOTOR CIRCUITS CONTINUITY	
• Connect: Adjustable Pedal Switch C2089. • Disconnect: Adjustable Pedal Motor C2003. • Measure the resistance between the adjustable pedal motor C2003-1, circuit 34-AL18 (BU/RD), harness side and ground; and between the adjustable pedal motor C2003-2, circuit 35-AL18 (VT/BU), harness side and ground.  N0002872 • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new adjustable pedal motor. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Pinpoint Test D: DTC B1990: Pedal Forward/Rearward Potentiometer Feedback Circuit Failure

Normal Operation

The adjustable brake and accelerator pedals with memory feature are controlled by the front electronic module (FEM) and are operational with the ignition switch ON or OFF. The FEM supplies voltage to the adjustable pedal 2-way motor until the switch is released or until the travel limit is reached. The memory feature allows the driver to program a personalized pedal position that can be recalled using the memory switches or remote keyless entry transmitters.

Possible Causes

- circuit 8-AL18 (WH/RD) open, short to voltage, or short to ground
- circuit 7-AL18 (YE/RD) open, short to voltage, or short to ground
- circuit 9-AL18 (BN/RD) open, short to voltage, or short to ground
- FEM
- adjustable pedal potentiometer

PINPOINT TEST D: DTC B1990: PEDAL FORWARD/REARWARD FEEDBACK CIRCUIT FAILURE

Test Step	Result / Action to

	Take
D1 CHECK THE FRONT ELECTRONIC MODULE (FEM) FOR CORRECT OUTPUT PIDs	
• Use the adjustable pedal switch to move the pedals to a central position. • Monitor the FEM pedal position PID while moving the adjustable pedal switch into the FORWARD position, then into the REARWARD position. • **Does the PID value decrease with forward movement and increase with rearward movement throughout the pedal's entire travel?**	**Yes** REFER to Section 419-10 for further diagnosis. CLEAR the DTC(s). REPEAT the self-test. **No** GO to D2 .
D2 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: FEM C201e. • Disconnect: FEM C201f. • Disconnect: Adjustable Pedal Potentiometer C268. • Measure the voltage between adjustable pedal potentiometer harness side and ground as follows: **Adjustable Pedal Potentiometer C268 / Circuit** 1 — 9-AL18 (BN/RD) 2 — 8-AL18 (WH/RD) 3 — 7-AL18 (YE/RD)  N0002873 • **Is voltage present?**	**Yes** REPAIR the circuit(s). CLEAR the DTC(s). REPEAT the self-test. **No** GO to D3 .
D3 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between adjustable pedal motor C268-2, circuit 8-AL18 (WH/RD), harness side and ground; and between adjustable pedal motor C268-3, circuit 7-AL18 (YE/RD), harness side and ground; and between adjustable pedal motor C268-1, circuit 9-AL18 (BN/RD), harness side and ground.  N0002874	**Yes** GO to D4 . **No** REPAIR the circuit in question. CLEAR the DTC(s). REPEAT the self-test.

• **Are the resistances less than 10,000 ohms?**	
D4 CHECK THE ADJUSTABLE PEDAL MOTOR CIRCUITS FOR AN OPEN	
• Measure the resistance between adjustable pedal motor harness side and the FEM harness side as follows: **Adjustable Pedal Potentiometer C268** / **FEM (C201e, C201f)** C268-1, circuit 9-AL18 (BN/RD) / C201e-18, circuit 9-AL18 (BN/RD) C268-2, circuit 8-AL18 (WH/RD) / C201e-5, circuit 8-AL18 (WH/RD) C268-3, circuit 7-AL18 (YE/RD) / C201f-16, circuit 7-AL18 (YE/RD)  N0002875 • **Are the resistances less than 5 ohms?**	**Yes** GO to D5 . **No** REPAIR the circuit(s). CLEAR the DTC(s). REPEAT the self-test.
D5 CHECK THE ADJUSTABLE PEDAL POTENTIOMETER	
• Disconnect: Adjustable Pedal Potentiometer C268. • Measure the resistance between the adjustable pedal potentiometer C268-2, circuit 8-AL18 (WH/RD), harness side and the adjustable pedal potentiometer C268-3, circuit 7-AL18 (YE/RD), harness side; and between the adjustable pedal potentiometer C268-2, circuit 8-AL18 (WH/RD), harness side and the adjustable pedal potentiometer C268-1, circuit 9-AL18 (BN/RD) harness side.  N0002876 • **Are the resistances between 3,700 ohms and 5,400 ohms?**	**Yes** INSTALL a new FEM. REFER to Section 419-10 . CLEAR the DTC(s). REPEAT the self-test. **No** INSTALL a new adjustable pedal motor. CLEAR the DTC(s). REPEAT the self-test.

Pinpoint Test E: Vibration When The Brakes Are Applied

Possible Causes

- uneven brake pad wear
- brake disc pad transfer
- brake disc
- suspension components

PINPOINT TEST E: VIBRATION WHEN THE BRAKES ARE APPLIED

Test Step	Result / Action to Take
E1 CHECK THE OASIS AND FOR TSBs	
• Check the On-Line Automotive Service Information System (OASIS) and Technical Service Bulletins (TSBs) for applicable brake concerns. • **Is there applicable information available on the OASIS or in a TSB?**	**Yes** REFER to the OASIS or the TSB. CARRY OUT any necessary repairs that are indicated by the OASIS or the TSB. If the concern is still present, GO to E2 . **No** GO to E2 .
E2 ROAD TEST THE VEHICLE LIGHT BRAKING	
• Inspect the wheels and tires. Refer to Section 204-04 . • Road test the vehicle. Warm the brakes by slowing the vehicle from 80 to 32 km/h (50 to 20 mph) using light brake force. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using light pedal force. • **Is there a vibration/shudder felt in the steering wheel, seat, or brake pedal?**	**Yes** GO to E5 . **No** GO to E3 .
E3 ROAD TEST THE VEHICLE MODERATE TO HEAVY BRAKING	
• Road test the vehicle. At highway speeds of 89-97 km/h (55-60 mph), apply the brake using a moderate to heavy pedal force. • **Is there a vibration/shudder?**	**Yes** GO to E4 . **No** The concern is not present at this time.
E4 NORMAL ACTUATION OF THE anti-lock braking system (ABS) SYSTEM DIAGNOSIS	
• During moderate to heavy braking, noise from the hydraulic control unit (HCU) and pulsation in the brake pedal can be noted. Pedal pulsation coupled with noise during heavy braking or on loose gravel, bumps, or wet or snowy surfaces is acceptable and indicates correct functioning of the ABS system. Pedal pulsation or steering wheel nibble (frequency is proportioned to the vehicle speed) indicates a concern with a brake or suspension component. • **Is the vibration/shudder vehicle speed sensitive?**	**Yes** GO to E6 . **No** The concern is not present at this time.
E5 APPLICATION OF THE PARKING BRAKE	
• This test is not applicable to vehicles with drum-in-hat type parking brakes. For vehicles with drum-in-hat parking brakes, proceed to the next test step. For all other vehicles, apply the parking brake to identify if the problem is in the front or rear brake. At highway speeds of 89-97	**Yes** GO to E8 . **No** GO to E6 .

km/h (55-60 mph), lightly apply the parking brake until the vehicle slows down. Release the parking brake immediately after the test. • **Is there a vibration/shudder?**	
E6 CHECK THE FRONT SUSPENSION	
• Check the front suspension. Refer to Section 204-01 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to E7 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
E7 RESURFACE THE FRONT BRAKE DISCS	
• ⚠ **CAUTION: Do not use a bench lathe to machine the brake discs.** • **NOTE:** Follow the manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the front brake discs. Refer to Brake Disc Machining in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** GO to E8 . **No** The concern has been corrected and is not present at this time. No additional repairs necessary.
E8 CHECK THE REAR SUSPENSION	
• Check the rear suspension. Refer to Section 204-02 . • **Are all the suspension components in satisfactory condition?**	**Yes** GO to E9 . **No** REPAIR or INSTALL new components as necessary. TEST the system for normal operation.
E9 RESURFACE THE REAR BRAKE DISC	
• ⚠ **CAUTION: Do not use a bench lathe to machine the brake discs.** • **NOTE:** Follow the manufacturer's instructions to machine the brake discs. After machining, make sure the brake disc meets the thickness specification. • Resurface the rear brake discs. Refer to Brake Disc Machining in this section. • Road test the vehicle. • **Is the vibration/shudder present?**	**Yes** REFER to Section 100-04 to continue diagnosis of the vibration. **No** The concern has been corrected and is not present at this time. No additional repairs necessary.

Component Tests

Brake Booster

1. Check the hydraulic brake system for leaks or insufficient fluid.

2. With the transmission in NEUTRAL, stop the engine and apply the parking brake control. Apply the brake pedal several times to exhaust all vacuum in the system.

3. Apply the brake pedal and hold it in the applied position. Start the engine. If the vacuum system is operating, the brake pedal tends to move downward under constant foot pressure.

4. If downward movement of the brake pedal is felt, the brake booster is functioning. If no downward movement of the brake pedal is felt, install a new brake booster.

5. Operate the engine a minimum of 10 seconds at fast idle. Stop the engine, and let the vehicle stand for 10 minutes. Then apply the brake pedal with approximately 89 N (20 lb) of force. The brake pedal feel should be the same as that noted with the engine operating. If the brake pedal feels hard (no power assist), install a new brake booster vacuum hose assembly and retest. If the brake pedal feels spongy, bleed the hydraulic system to remove air. For additional information, refer to Brake System Bleeding in this section.

Check Valve

The function of the check valve is to allow manifold vacuum to enter the brake booster and prevent the escape of vacuum if manifold vacuum is lost during sustained full throttle operation. The check valve is located inside the aspirator in the brake booster vacuum hose.

To test the function of the check valve:

- Start and run the engine for at least 10 seconds.
- Operate the brake pedal to check for power assist.
- Disconnect the vacuum booster hose from the engine port.
- There should be enough vacuum retained in the brake booster for at least one more power-assisted brake operation.

Brake Master Cylinder Bypass Condition Test

1. Disconnect the brake lines at the brake master cylinder.

2. Plug the outlet ports of the brake master cylinder.

3. Apply the brakes. If brake pedal height cannot be maintained, the brake master cylinder has an internal leak and must be rebuilt or a new master cylinder must be installed.

Compensator Port Check

The purpose of the compensator ports in the brake master cylinder is to supply any additional brake fluid required by the system due to brake pad wear and to allow brake fluid returning from the brake lines to the brake master cylinder to enter the brake master cylinder reservoir.

The returning brake fluid causes a slight turbulence in the brake master cylinder reservoir. Turbulence seen in the brake master cylinder reservoir upon application or release of the brake pedal is normal and shows that the compensating ports are not plugged.

Brake Disc Machining

Printable View (22 KB)

Special Tool(s)

 ST2032-A	On-Car Brake Lathe 201-00002 or equivalent

Material

Item	Specification
High Temperature Nickel Anti-Sieze Lubricant XL-2	ESE-M12A4-A
Brake Parts Cleaner PM-4	

Brake Disc Machining

⚠ **CAUTION: Do not use a bench lathe to machine the brake discs.**

NOTE: Read the entire operating manual and view the video shipped with the lathe before installing, operating, or repairing the lathe.

NOTE: If the thickness of the brake disc is less than the minimum thickness to machine specification, install a new brake disc. This makes sure that the brake disc thickness is above the minimum thickness after machining.

NOTE: Do not machine new brake discs.

NOTE: Lateral runout and disc thickness variation measurements are not required because correct adjustment of the on-vehicle brake lathe makes sure that these dimensions are within specifications.

1. **NOTE:** It is not necessary to disconnect the brake line from the brake caliper.

   Position the brake caliper and brake caliper anchor bracket aside. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

2. For vehicles with a 2-piece brake disc and hub assembly:
   1. Mark the brake disc and the wheel stud for correct indexing during re-assembly.
   2. Remove the brake disc from the hub.
   3. ⚠ **CAUTION: Do not use an abrasive sanding disc since it removes paint or other protective finishes from the wheel or metal from the mounting surfaces, adversely affecting corrosion protection and brake disc lateral runout.**

      Remove corrosion from the wheel mounting surface, both disc mounting surfaces, and hub mounting surface.
   4. Align the match marks and install the brake disc on the hub.

3. Machine the brake disc using an on-car brake lathe.
    1. Install the hub adapter and silencer belt, if necessary.
    2. Install the cutting lathe.
    3. If lathe is not self adjusting, adjust the lathe oscillation using a dial indicator. Total indicated reading (TIR) target is 0.000 mm (0.000 in), maximum is 0.08 mm (0.003 in).
    4. Center the cutting head, adjust the cutting bits, and install the chip deflector.
    5. **NOTE:** The depth of cut should be between 0.10 and 0.20 mm (0.004 and 0.008 in). Lighter cuts causes the bit to heat up and wear faster. Heavier cuts causes poor brake disc surface finish.

       Machine the brake disc.
    6. Remove the lathe and, if installed, the silencer belt.
    7. Remove the hub adapter.

4. Remove metal shavings.

5. For vehicles with a 2-piece brake disc and hub assembly:
    1. Remove the brake disc from the hub.
    2. Remove metal shavings from the hub, the brake disc mounting surfaces and from the ABS sensors.
    3. Apply anti-seize lubricant to hub mounting surface to prevent corrosion.
    4. Align the match marks and install the brake disc on the hub.

6. **NOTE:** It is not required to install new brake pads if friction material properties are within guidelines. Refer to Brake Pads in this section.

   Install the brake caliper and brake caliper anchor bracket. For additional information, refer to Section 206-03 for front disc brakes or Section 206-04 for rear disc brakes.

Brake System Bleeding

Printable View (22 KB)

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool

Manual

⚠ WARNING: Use of any other than approved DOT 3 or DOT 4 brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

⚠ CAUTION: Do not allow the brake master cylinder reservoir to run dry during the bleeding operation. Keep the brake master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

NOTE: When any part of the hydraulic system has been disconnected for repair or installation of new components, air can get into the system and cause spongy brake pedal action. This requires bleeding of the hydraulic system after it has been correctly connected. The hydraulic system can be bled manually or with pressure bleeding equipment.

1. Clean all dirt from and remove the brake master cylinder filler cap and fill the brake master cylinder reservoir with the specified brake fluid.

2. Remove the bleeder screw cap and place a box end wrench on the RH rear bleeder screw. Attach a rubber drain tube to the RH rear bleeder screw and submerge the free end of the tube in a container partially filled with clean brake fluid.

3. Have an assistant hold firm pressure on the brake pedal.

4. Loosen the RH rear bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the RH rear bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.

5. Tighten the RH rear bleeder screw and install the bleeder screw cap.

- Tighten to 20 Nm (15 lb-ft).

6. Repeat Steps 2, 3, 4 and 5 for the LH rear bleeder screw.

7. Remove the bleeder screw cap and place a box end wrench on the RH front disc brake caliper bleeder screw. Attach a rubber drain tube to the RH front disc brake caliper bleeder screw, and submerge the free end of the tube in a container partially filled with clean brake fluid.

8. Have an assistant hold firm pressure on the brake pedal.

9. Loosen the RH front disc brake caliper bleeder screw until a stream of brake fluid comes out. While the assistant maintains pressure on the brake pedal, tighten the RH front disc brake caliper bleeder screw.
   - Repeat until clear, bubble-free fluid comes out.
   - Refill the brake master cylinder reservoir as necessary.

10. Tighten the RH front disc brake caliper bleeder screw and install the bleeder screw cap.
    - Tighten to 13 Nm (10 lb-ft).

11. Repeat Steps 7, 8, 9 and 10 for the LH front disc brake caliper bleeder screw.

Pressure

⚠ WARNING: Use of any other than approved DOT 3 or DOT 4 brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

⚠ CAUTION: Do not allow the master cylinder to run dry during the bleeding operation. Keep the master cylinder reservoir filled with the specified brake fluid. Never reuse the brake fluid that has been drained from the hydraulic system.

1. Clean all dirt from and remove the brake master cylinder filler cap. Fill the brake master cylinder reservoir with the specified brake fluid.

2. **NOTE:** Master cylinder pressure bleeder adapter tools are available from various manufacturers of pressure bleeding equipment. Follow the instructions of the manufacturer when installing the adapter.

   Install the bleeder adapter to the brake master cylinder reservoir, and attach the bleeder tank hose to the fitting on the adapter.

3. **NOTE:** Bleed the longest line first. Make sure the bleeder tank contains enough specified brake fluid to complete the bleeding operation.

   Remove the bleeder screw cap and place a box end wrench on the RH rear brake caliper bleeder screw. Attach a rubber drain tube to the RH rear brake caliper bleeder screw, and submerge the free

end of the tube in a container partially filled with clean brake fluid.

4. Open the valve on the bleeder tank.

5. Loosen the RH rear brake caliper bleeder screw. Leave open until clear, bubble-free brake fluid flows, then tighten the RH rear brake caliper bleeder screw and remove the rubber hose and install the bleeder screw cap.
    - Tighten to 20 Nm (15 lb-ft).

6. Continue bleeding the rear of the system, going in order from the LH rear brake caliper bleeder screw to the RH front disc brake caliper bleeder screw ending with the LH front disc brake caliper bleeder screw.

7. Tighten the front brake caliper bleeder screw and remove the hose.
    - Tighten to 13 Nm (10 lb-ft).

8. Close the bleeder tank valve. Remove the tank hose from the adapter, and remove the adapter.

Brake System Leak Check

Printable View (9 KB)

1. **NOTE:** Brake fluid is water soluble and it is possible that all evidence of fluid leakage has been washed off if the vehicle has been operated in the rain or snow.

   Make sure the brake master cylinder reservoir is full.

2. Apply the brakes several times and make sure the brake pedal feel is not spongy. If necessary, bleed the system. For additional information, refer to Brake System Bleeding in this section.

3. Verify that the reservoir level is not dropping.

4. If the reservoir level is dropping, inspect the brake components, fittings and lines to locate the source of the leak.

Front Disc Brake

The front disc brake system includes the brake caliper, the disc brake pads, the anchor plate, and the brake disc. The brake caliper is a dual piston floating design. The brake caliper is mounted to the anchor plate by the caliper guide bolts. The brake caliper slides, or floats, on the caliper guide bolts. The brake disc is a cast, ventilated type disc. When mechanical force is applied by the driver to the brake pedal, the force is converted into hydraulic pressure by the master cylinder. The hydraulic force is directed to the disc brake calipers and transferred to the brake pads. The brake pads are then forced against the brake disc friction surfaces by the brake caliper pistons. The friction of the brake pads on the brake disc causes the slowing of wheel rotation and the vehicle.

Removal

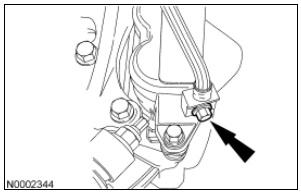
⚠ WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately. Failure to follow this instruction may result in personal injury.

⚠ CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the brake caliper flow bolt and discard the 2 copper washers.



3. Remove the 2 brake caliper bolts and the brake caliper.

Installation

1. Position the brake caliper and install the 2 bolts.
   - To install, tighten to 35 Nm (26 lb-ft).

2. Using 2 new copper washers, position the brake flexible hose and install the flow bolt.
   - To install, tighten to 47 Nm (35 lb-ft).

3. Bleed the brake system. For additional information, refer to Section 206-00 .

Brake Pads

Printable View (9 KB)

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the 2 brake caliper bolts and position the brake caliper aside.
3. Remove the brake pads and the spring clips.

Installation

1. **NOTE:** Use a suitable tool to protect the pistons and the boots.

   Compress the caliper pistons.
2. Install the spring clips and brake pads.
3. Position the brake caliper and install the 2 brake caliper bolts.
   - To install, tighten to 35 Nm (26 lb-in).

Brake Caliper Anchor Plate

Printable View (7 KB)

Removal and Installation

1. Remove the brake pads. For additional information, refer to Brake Pads in this section.

2. Remove and discard the 2 brake caliper anchor plate bolts.
   - To install, tighten to 103 Nm (76 lb-ft).

3. To install, reverse the removal procedure.

Brake Disc

Printable View (8 KB)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (Canada CXG-2-B)	ESE-M12A4-A
Brake Parts Cleaner PM-4	

Removal

1. Remove and discard the 2 brake caliper anchor plate bolts and position the brake caliper anchor plate aside.

2. Mark a wheel stud and the corresponding brake disc lug hole.
   - This ensures the lowest front brake disc runout is maintained during reassembly.

3. Remove the brake disc.

Installation

1. Clean any rust or debris from brake disc and wheel hub.
   - Use brake parts cleaner to clean the front brake disc and hub surfaces.

2. Apply a thin coat of high temperature nickel anti-seize lubricant to the hub flange.

3. Install the brake disc, aligning the marks on the disc and the wheel stud.

4. Position the brake caliper anchor plate and install 2 new bolts.
   - To install, tighten to 103 Nm (76 lb-ft).

Brake Disc Shield

Printable View (9 KB)

Removal and Installation

1. Remove the brake disc. For additional information, refer to Brake Disc in this section.
2. **CAUTION: Do not use a drill larger than 6.0 mm (0.23 in) to remove the rivet from the brake disc shield.**

   Using a 5.5 mm (0.21 in) drill, remove the 3 rivets.
3. Remove the brake disc shield.
4. To install, reverse the removal procedure.

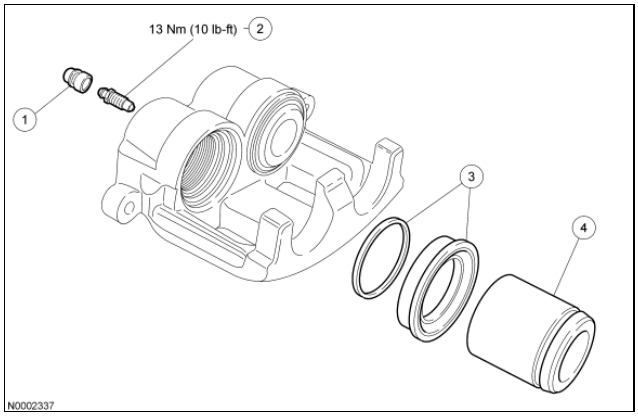
Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A

Brake Caliper Exploded View



Item	Part Number	Description
1	2L126	Bleeder screw cap (part of kit 2B294/2B302)
2	2208	Bleeder screw
3	2120	Brake caliper piston seal kit
4	2196	Brake caliper piston

Disassembly

⚠ WARNING: Use of any other than approved DOT 3 motor vehicle brake fluid will cause permanent damage to brake components and will render the brakes inoperative. Failure to follow these instructions may result in personal injury.

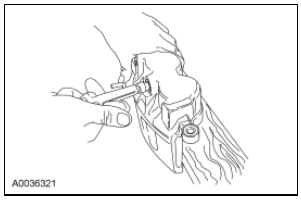
⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15

minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately. Failure to follow this instruction may result in personal injury.

⚠ CAUTION: Brake fluid is harmful to painted or plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Remove the brake caliper. For additional information, refer to Brake Caliper in this section.
2. Drain the remaining brake fluid from the brake caliper.
3. Secure the brake caliper in a vise.
4. **⚠ CAUTION: Apply moderate air pressure in short bursts to prevent an uncontrolled release of the piston.**

   Place a piece of wood in the caliper. Remove the piston by applying moderate air pressure through the bleeder screw port.



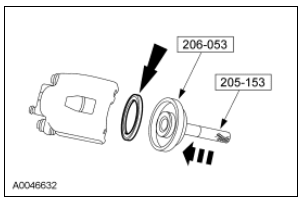
5. **NOTE:** Do not hone the piston bores. If the brake caliper cylinder bore/piston is excessively scored or corroded, install a new brake caliper.

   Remove and discard the piston seal and dust boot

Assembly

1. **⚠ CAUTION: Never reuse the piston seal or dust boot.**

   Lubricate each cylinder bore, the piston seals, the caliper pistons, and the dust boots with brake fluid.
2. Install the piston seals.
3. Use the special tools to install the dust boot.



4. Install the brake caliper piston.
5. Install the brake caliper. For additional information, refer to Brake Caliper in this section.

Rear Disc Brake

Printable View (7 KB)

The disc brake caliper is held in place using a brake caliper anchor plate bolted to the wheel knuckle. It uses 2 brake caliper guide pins to allow the single piston caliper to move as the disc brake pads wear.

The brake disc is a non-ventilated, full-cast design. The brake disc is removed and installed with the brake caliper and brake caliper anchor plate removed as an assembly.

The brake disc shield is mounted to the wheel knuckle and is held in place by the hub and bearing bolts. It protects the wheel bearings and inner surface of the brake disc from damaging road debris.

The disc brake pads are housed in the brake caliper anchor plate assembly and are of a non-asbestos, semi-metallic composition.

Rear Disc Brake

Printable View (7 KB)

Refer to Section 206-00 .

Disc Brake System Exploded View

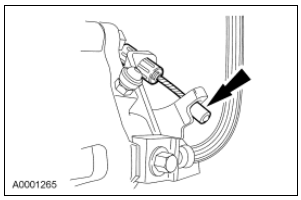
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A
High Temperature Nickel Anti-Seize Lubricant XL-2 (Canada CXG-2)	ESE-M12A4-A
Silicone Brake Caliper Grease and Dielectric Compound XG-3-A	ESE-M1C171-A
Brake Parts Cleaner PM-4	

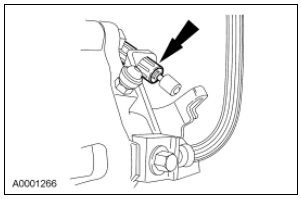
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

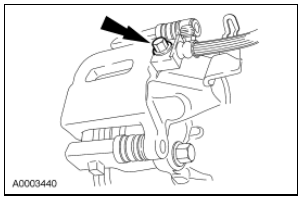
2. Remove the parking brake cable end from the parking brake lever arm.



3. Disconnect the parking brake cable and conduit from the brake caliper.



4. Remove the brake caliper flow bolt and discard the 2 copper washers.



5. Remove the 2 brake caliper bolts.

6. Remove the brake caliper.

7. Inspect the disc brake caliper.
    - If leaks or damaged boots are found, install a new disc brake caliper.

Installation

1. Position the brake caliper and install the 2 bolts.
    - Tighten to 35 Nm (26 lb-ft).

2. Using 2 new copper washers, position the front brake flexible hose and install the flow bolt.
    - Tighten to 47 Nm (35 lb-ft).

3. Connect the parking brake cable and conduit to the brake caliper.

4. Install the parking brake cable end to the parking brake lever arm.

5. Bleed the caliper. For additional information, refer to Section 206-00 .

Brake Pads

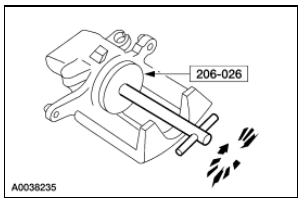
Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the 2 brake caliper bolts.
3. Remove the pads and spring clip.
   - Discard the spring clips.
4. Inspect the pads for wear and contamination.

Installation

1. Using the special tool, compress the brake caliper piston into the disc brake caliper.



2. Position the notch in the caliper piston up and down to align with the alignment pin on the brake pad.
3. Install the new spring clips and brake pads.
4. Position the brake caliper and install the 2 bolts.
   - Tighten to 35 Nm (26 lb-ft).

High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A

Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the 2 brake caliper anchor plate bolts.
3. **CAUTION: Using a suitable tool, support the brake caliper and brake caliper anchor plate to the vehicle.**

   Position the brake caliper anchor plate and brake caliper assembly aside.
4. Measure the brake disc thickness and install a new brake disc if it is not within specification.
5. Inspect the disc brake caliper and install a new one as required.

Installation

1. Clean any rust or debris from the brake disc and the wheel hub.
   - Use brake parts cleaner to clean the brake disc and hub surfaces.
2. **CAUTION: Do not allow the lubricant to make contact with the wheel studs, brake pads, or brake disc.**

   Apply a thin coat of anti-seize lubricant to the hub flange.
3. Position the brake caliper and brake caliper anchor plate assembly and install the 2 bolts.
   - Tighten to 103 Nm (76 lb-ft).
4. Test the brakes for normal operation.

Brake Disc Shield

Printable View (10 KB)

Material

Item	Specification
Penetrating and Lock Lubricant XL-1	
Brake Parts Cleaner PM-4	

Removal and Installation

1. Remove the brake disc. For additional information, refer to Brake Disc in this section.
2. **CAUTION: Do not use a drill larger that 6.0 mm (0.23 in) to remove the rivet from the brake disc shield.**

   Remove the brake disc shield rivets.
3. **NOTE:** If the brake disc shield cannot be removed easily, apply rust penetrant and inhibitor on the brake disc to wheel hub mating surfaces.

   Remove the brake disc shield.
4. To install, reverse the removal procedure.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool

Principles of Operation

Electronic Parking Brake (EPB)

The electronic parking brake (EPB) replaces the function of the conventional hand brake lever system. The EPB has 2 functions. Its primary function is to hold the vehicle up to a 30% grade. The secondary function is to be able to decelerate the vehicle by using the EPB as an emergency brake.

The EPB system:

- has a switch located in the front console behind the gear selector. The switch is hard wired to the EPB module. It includes a yellow fault warning lamp.
- has a control module that communicates with the other vehicle modules through the standard corporate protocol (SCP) network.
- uses an electric motor and gearbox assembly to apply and release tension on a conventional parking brake cable system.

Electronic Parking Brake (EPB) Operation

Pull the parking brake switch upward to engage the parking brake. Release the switch, and it will return to the neutral position. To release the parking brake, make sure the ignition switch is turned to the ON position, press the brake pedal, then push the parking brake switch down. The instrument cluster BRAKE warning lamp will illuminate and will remain illuminated until the parking brake is released.

The EPB will automatically release when the gearshift lever is moved from Park with the ignition switch in the ON position. The EPB will also disengage if a gear is selected and the accelerator pedal is pressed. The EPB will not release when the release switch is activated. If the battery is disconnected, the EPB system must be reset; the vehicle message center will display APPLY PARK BRAKE or APPLY ((P)).

Electronic Parking Brake (EPB) Resetting

NOTE: The EPB can be released after the battery is reconnected.

The EPB system must be reset whenever the battery has been disconnected or has been in a state of discharge.

To reset the EPB system, follow the steps:

1. Place gearshift selector in the PARK position.
2. Turn the ignition switch to the ON position.
3. Press the brake pedal and at the same time pull on the EPB switch.
4. Release the EPB switch. To release the EPB switch, push on the EPB switch while depressing the brake pedal.

Inspection and Verification

1. Verify the customer concern by operating the EPB system.
2. Visually inspect for obvious signs of mechanical or electrical damage. Refer to the following chart:

Visual Inspection Chart

Mechanical	Electrical
• Parking brake cable(s) • Parking brake actuator • Parking brake shoes or related components • Rear brake caliper	• EPB switch • Front battery junction box (BJB) fuse 19 (30A) • Central junction box (CJB) fuse 7 (5A) • Connector(s) or connections • Circuitry • EPB module

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. If the diagnostic tool does not power up, refer to the diagnostic tool manual.
5. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
   - SCP, ISO or UBP circuit faults; all electronic control units no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for the EPB module, Go To Pinpoint Test A .
   - System passed, retrieve and record the continuous DTCs and carry out self-test diagnostics for the EPB module.
6. If the DTCs retrieved are related to the concern, go to the Electronic Parking Brake (EPB) System Diagnostic Trouble Code (DTC) Index.
7. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnostics.

Electronic Parking Brake (EPB) System Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1317	Battery Voltage High	EPB	Go To Pinpoint Test A .
B1318	Battery Voltage Low	EPB	Go To Pinpoint Test A .
B1342	ECU is Defective	EPB	INSTALL a new EPB module. REFER to Parking Brake Module in this section.
B2477	Module Configuration Failure	EPB	**NOTE:** The EPB module is delivered from the manufacturer with this DTC. The EPB module will not operate until it has been configured. CONFIGURE the EPB module. REFER to Section 418-01 .
C1094	Park Brake Apply Switch Circuit Failure	EPB	Go To Pinpoint Test B .

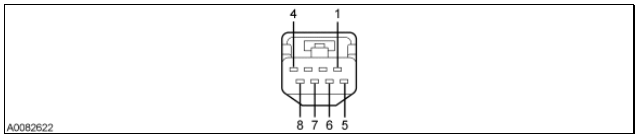
Symptom Chart

Symptom Chart
Connector Circuit Reference

Electronic Parking Brake (EPB) Switch C3218



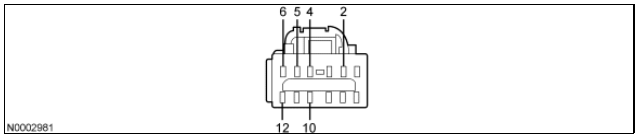
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	64S-CG15 (BU/WH) switch illumination power	Greater than 10 volts with the headlamp switch ON.
4	10-CG15 (GY/VT) EPB module to EPB switch release circuit	EPB module output to the EPB switch: open 4.0 volts/closed 2.5 volts.
5	9-CG15 (BN/BU) EPB switch ground	Continuity between the EPB switch and the Hall-effect sensor, less than 5 ohms resistance to ground.
6	31S-CG14 (BK/GN) yellow EPB indicator lamp ground	Continuity between the switch and the EPB module, less than 5 ohms resistance to ground (supplied by the EPB module) when the switch is illuminated.
7	75-CG14 (YE/GN) yellow EPB indicator lamp power	Power supplied from CJB fuse 7 (5A), hot at all times.
8	8-CG15 (WH/BU) EPB module to EPB switch apply circuit	EPB module output to the EPB switch: open 4.0 volts/closed 2.5 volts.

Electronic Parking Brake (EPB) Module C4205a

	Circuit Designation/Description	Normal Condition/Measurement

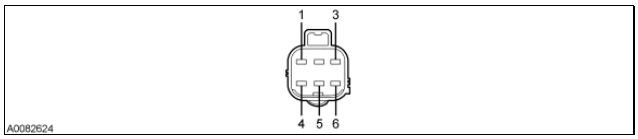
Pin Number(s)		
1	30-CG16 (RD/BU) power to the EPB module	Greater than 10 volts at all times supplied by BJB fuse 19 (30A), hot at all times.
2	33-CG19 (YE/VT) EPB actuator motor (-)	EPB switch at rest: half of B+ voltage/EPB switch applying: 0 volts/EPB switch releasing: B+ voltage.
3	32-CG19 (WH/VT) EPB actuator motor (+)	EPB switch at rest: half of B+ voltage/EPB switch applying: B+ voltage/EPB switch releasing: 0 volts.
4	31-CG16 (BK/BU) EPB module ground	0 volts and less than 5 ohms resistance to ground.

Electronic Parking Brake (EPB) Module C4205b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	31S-CG14 (BK/GN) yellow EPB indicator lamp ground	Continuity between the switch and the EPB module, less than 5 ohms resistance to ground (supplied by EPB module) when the switch is illuminated.
4	8-GC20 (WH/VT) Hall-effect signal	Voltage varies between 0 and 4.4 volts directly with EPB actuator rotation.
5	8-CG15 (WH/BU) EPB module to the EPB switch apply circuit	EPB module output to the EPB switch: open 4.0 volts/closed 2.5 volts.
6	10-CG15 (GY/VT) EPB module to the EPB switch release circuit	EPB module output to the EPB switch: open 4.0 volts/closed 2.5 volts.
10	7-CG20 (YE/VT) Hall-effect sensor power	Approximately 2 volts less than battery voltage, output from the EPB module to the EPB sensor.
12	9-CG20 (BN/WH) Hall-effect sensor and switch ground	0 volts, less than 5 ohms resistance to ground (supplied by the EPB module).

Electronic Parking Brake (EPB) Actuator C4206



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	32-CG19 (WH/VT) EPB actuator motor (+)	PB switch at rest: half of B+ voltage/EPB switch applying: B+ voltage/EPB switch releasing: 0 volts.
3	7-CG20 (YE/VT) Hall-effect sensor power	Approximately 2 volts output from the EPB module to the EPB sensor.
4		

	8-CG20 (WH/VT) Hall-effect signal	Voltage varies between 0 and 4.4 volts directly with EPB actuator rotation.
5	9-CG20 (BN/WH) Hall-effect sensor ground	0 volts and less than 5 ohms to ground.
6	33-CG19 (YE/VT) EPB actuator motor (-)	EPB switch at rest: half of B+ voltage/EPB switch applying: 0 volts/EPB switch releasing: B+ voltage.

Pinpoint Test A: DTC B1317/B1318 Battery Voltage High/Low

Normal Operation

The vehicle electrical system supplies 12 volts to the electronic parking brake (EPB) module.

Voltage is supplied by circuit 30-CG16 (RD/BU) (power hot at all times). Ground is supplied by circuit 31-CG16 (BK/BU).

Possible Causes

- charging system
- battery
- circuit 31-CG16 (BK/BU) open
- circuit 30-CG16 (RD/BU) open

PINPOINT TEST A: DTC B1317/B1318 BATTERY VOLTAGE HIGH/LOW

⚠ **CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**

Test Step	Result / Action to Take
A1 CHECK THE BATTERY VOLTAGE	
• Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running. • **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**	**Yes** GO to A2 . **No** REFER to Section 414-00 . CLEAR the DTC(s). REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
A2 CHECK THE VOLTAGE TO THE EPB MODULE	
• Disconnect: EPB Module C4205a. • Measure the voltage between the EPB module C4205a-1, circuit 30-CG16 (RD/BU), harness side and ground.	**Yes** GO to A3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

 • **Is the voltage greater than 10 volts?**	
A3 CHECK THE EPB MODULE GROUND	
• Key in OFF position. • Measure the resistance between EPB module C4205a-4, circuit 31-CG16 (BK/BU), harness side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** CHECK the module communications network. REFER to Section 418-00 . **No** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test.

Pinpoint Test B: DTC C1094/C1782: Park Brake Apply/Release Switch Circuit Failure

Normal Operation

The electronic parking brake (EPB) switch circuits 8-CG15 (WH/BU) and 10-CG15 (GY/VT) receive a reference voltage from the EPB module when the switch is in its neutral position. This voltage is between 3.5 and 4.5 volts. When the switch contacts close on the apply or release side, a resistor inside the switch is bypassed, causing the reference voltage on switch circuits 8-CG15 (WH/BU) or 10-CG15 (GY/VT) to change from 1.5 to 3.0 volts. When the EPB module receives this voltage range on the apply or release circuit, an output signal is generated to the actuator to apply or release the EPB.

Possible Causes

- EPB switch
- circuit 8-CG15 (WH/BU) open or short to voltage
- circuit 10-CG15 (GY/VT) open or short to voltage
- EPB module

PINPOINT TEST B: DTC C1094/C1782: PARK BRAKE APPLY/RELEASE SWITCH CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
B1 CHECK THE ELECTRONIC PARKING BRAKE (EPB) SWITCH	
• Disconnect the battery. Refer to Section 414-00 . • Disconnect: EPB Switch C3218. • Measure the resistance between EPB switch C3218 pin 8, component side and C3218 pin 5, component side while the	**Yes** GO to B2 . **No** INSTALL a new parking brake.

EPB switch is in the idle position; and between the EPB switch C3218 pin 4, component side and C3218 pin 5, component side while the EPB switch is in the idle position.  N0002879 • Measure the resistance between the EPB switch C3218 pin 8, component side and C3218 pin 5, component side while the EPB switch is in the apply position; and between the EPB switch C3218 pin 4, component side and C3218 pin 5, component side while the EPB switch is in the release position. • **Is the resistance between 149 - 153 ohms in the apply position and between 597 - 609 ohms in the idle position?**	REFER to Parking Brake Switch in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
B2 CHECK CIRCUIT 8-CG15 (WH/BU) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the EPB switch C3218-8, circuit 8-CG15 (WH/BU), harness side and ground.  N0002880 • **Is battery voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. RESET the EPB module. REFER to Electronic Parking Brake (EPB) Resetting in this section. REPEAT the self-test. **No** GO to B3 .
B3 CHECK CIRCUIT 8-CG15 (WH/BU) FOR AN OPEN	
• Disconnect: EPB Module C4205b. • Measure the resistance between the EPB module C4205b-5, circuit 8-CG15 (WH/BU), harness side and the EPB switch C3218-8, circuit 8-CG15 (WH/BU), harness side.  N0002881 • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
B4 CHECK CIRCUIT 10-CG15 (GY/VT) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the EPB switch C3218-4, circuit 10-CG15 (GY/VT), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB)

 N0002882 • **Is battery voltage present?**	Resetting in this section. **No** GO to B5 .
B5 CHECK CIRCUIT 10-CG15 (GY/VT) FOR AN OPEN	
• Measure the resistance between the EPB module C4205b-6 circuit 10-CG15 (GY/VT), harness side and the EPB switch C3218-4 circuit 10-CG15 (GY/VT), harness side. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test C: DTC C1769/C1783: Park Brake Apply/Release Switch Circuit Short To Ground

Normal Operation

The electronic parking brake (EPB) switch circuits 8-CG15 (WH/BU) and 10-CG15 (GY/VT) receive a reference voltage from the EPB module when the switch is in its neutral position. This voltage is between 3.5 and 4.5 volts. When the switch contacts close on the apply or release side, a resistor inside the switch is shorted, causing the voltage on switch circuits 8-CG15 (WH/BU) or 10-CG15 (GY/VT) to change from 1.5 to 3.0 volts. When the EPB module receives this voltage range on the apply or release circuit, an output signal is generated to the actuator to apply or release the EPB.

Possible Causes

- circuit 8-CG15 (WH/BU) short to ground
- circuit 10-CG15 (GY/VT) short to ground
- EPB module
- EPB switch

PINPOINT TEST C: DTC C1769/C1783: PARK BRAKE APPLY/RELEASE SWITCH SHORT TO GROUND

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
C1 RETRIEVE THE DTCs	
• Connect the diagnostic tool.	**Yes** GO to C2 .

• Enter the following diagnostic mode on the diagnostic tool: Retrieve the DTC(s). • **Is DTC C1769 retrieved?**	**No** If DTC C1783 is retrieved, GO to C3 .
C2 CHECK CIRCUIT 8-CG15 (WH/BU) FOR AN OPEN	
• Disconnect the battery. Refer to Section 414-00 . • Disconnect: EPB Switch C3218. • Measure the resistance between the electronic parking brake (EPB) switch C3218-8, circuit 8-CG15 (WH/BU), harness side and ground.  N0002884 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
C3 CHECK CIRCUIT 10-CG15 (GY/VT) FOR AN OPEN	
• Measure the resistance between the EPB switch C3218-4, circuit 10-CG15 (GY/VT), harness side and ground.  N0002885 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C4 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
C4 CHECK THE EPB SWITCH PIDs	
• Using the diagnostic tool, monitor the EPB apply, neutral, and release PIDs while operating the EPB switch. • **Do the EPB PIDs match the EPB switch positions?**	**Yes** INSTALL a new EPB module. REFER to Parking Brake Module in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** INSTALL a new EPB switch. REFER to Parking Brake Switch in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test D: DTC C1784: Electronic Parking Brake (EPB) Motor Output Short To Ground

Normal Operation

The electronic parking brake (EPB) 2-way motor receives power from circuit 32-CG19 (WH/VT) or 33-CG19 (YE/VT), depending the direction of the motor revolution. When the EPB is applied, circuit 32-CG19 (WH/VT) is equal to the battery voltage and circuit 33-CG19 (YE/VT) is equal to 0 volts. When the EPB is released, 32-CR19 (YE/VT) is equal to 0 volts and 33-CT19 (YE/VT) is equal to the battery voltage. Otherwise, both circuits are at one half of the battery voltage.

Possible Causes

- circuit 32-CG19 (WH/VT) short to ground
- circuit 33-CG19 (YE/VT) short to ground
- EPB module
- EPB switch
- EPB actuator

PINPOINT TEST D: C1784: ELECTRONIC PARKING BRAKE (EPB) MOTOR OUTPUT CIRCUIT SHORT TO GROUND

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
D1 CHECK CIRCUIT 32-CG19 (WH/VT) FOR A SHORT TO GROUND	
• Disconnect the battery. Refer to Section 414-00 . • Disconnect: EPB Module C4205a. • Measure the resistance between the EPB module C4205a-3 circuit 32-CG19 (WH/VT), harness side and ground.  N0002886 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
D2 CHECK CIRCUIT 33-CG19 (YE/VT) FOR A SHORT TO GROUND	
• Measure the resistance between the EPB module C4205a-2, circuit 33-CG19 (YE/VT), harness side and ground.	**Yes** INSTALL a new EPB module. REFER to Parking Brake Module in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

 N0002887 • **Is the resistance greater than 10,000 ohms?**	**No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test E: DTC C1785: Electronic Parking Brake (EPB) Motor Output Open Circuit

Normal Operation

The electronic parking brake (EPB) 2-way motor receives power from circuit 32-CG19 (WH/VT) or 33-CG19 (YE/VT), depending on the direction of the motor revolution. When the EPB is applied, circuit 32-CG19 (WH/VT) is equal to the battery voltage and circuit 33-CG19 (YE/VT) is equal to 0 volts. When the EPB is released, 32-CR19 (YE/VT) is equal to 0 volts and 33-CT19 (YE/VT) is equal to the battery voltage. Otherwise, both circuits are at one half of the battery voltage.

Possible Causes

- circuit 32-CG19 (WH/VT) open
- circuit 33-CG19 (YE/VT) open
- EPB actuator
- EPB module

PINPOINT TEST E: DTC C1785: ELECTRONIC PARKING BRAKE (EPB) MOTOR OUTPUT OPEN CIRCUIT

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
E1 CHECK CIRCUIT 32-CG19 (WH/VT) FOR AN OPEN	
• Disconnect the battery. Refer to Section 414-00 . • Disconnect: EPB Module C4205a. • Disconnect: EPB Actuator C4206. • Measure the resistance between the EPB module C4205a-3, circuit 32-CG19 (WH/VT), harness side and the EPB actuator C4206-1, circuit 32-CG19 (WH/VT), harness side.  N0002888 • **Is the resistance less than 5 ohms?**	**Yes** GO to E2 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

E2 CHECK CIRCUIT 33-CG19 (YE/VT) FOR AN OPEN	
• Measure the resistance between the EPB module C4205a-2, circuit 33-CG19 (YE/VT), harness side and the EPB actuator C4206-6, circuit 33-CG19 (YE/VT), harness side.  N0002889 • **Is the resistance less than 5 ohms?**	**Yes** GO to E3 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
E3 CHECK THE EPB ACTUATOR INTEGRITY	
• Connect a fused (10A) jumper wire to the EPB actuator C4206 pin 6, circuit 33-CG19 (YE/VT), component side and to the positive battery terminal.  N0002890 • Connect a fused (10A) jumper wire to the EPB actuator C4206 pin 1, circuit 32-CG19 (WH/VT), component side and to the negative battery terminal. • Reverse the leads to verify the actuator operates in both directions. • **Does the EPB actuator operate in both directions?**	**Yes** INSTALL a new EPB module. REFER to Parking Brake Module in this section. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. REPEAT the self-test. TEST the system for normal operation. **No** INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. REPEAT the self-test. TEST the system for normal operation.

Pinpoint Test F: DTC C1786: Electronic Parking Brake (EPB) Motor Output Circuit Short To Voltage

Normal Operation

The electronic parking brake (EPB) 2-way motor receives power from circuit 32-CG19 (WH/VT) or 33-CG19 (YE/VT), depending on the direction of the motor revolution. When the EPB is applied, circuit 32-CG19 (WH/VT) is equal to battery voltage and circuit 33-CG19 (YE/VT) is equal to 0 volts. When the EPB is released, 32-CR19 (YE/VT) is equal to 0 volts and 33-CT19 (YE/VT) is equal to battery voltage. Otherwise both circuits are at one half of the battery voltage.

Possible Causes

- circuit 32-CG19 (WH/VT) short to voltage
- circuit 33-CG19 (YE/VT) short to voltage
- EPB actuator
- EPB module

PINPOINT TEST F: DTC C1786: EPB MOTOR OUTPUT CIRCUIT SHORT TO VOLTAGE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
F1 CHECK CIRCUIT 32-CG19 (WH/VT) FOR A SHORT TO VOLTAGE	
• Disconnect: EPB Module C4205a. • Disconnect: EPB Actuator C4206. • Measure the voltage between the EPB module C4205a-3, circuit 32-CG19 (WH/VT), harness side and ground.  N0002891 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** GO to F2 .
F2 CHECK CIRCUIT 33-CG19 (YE/VT) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the EPB module C4205a-2, circuit 33-CG19 (YE/VT), harness side and ground.  N0002892 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** GO to F3 .
F3 CHECK THE EPB ACTUATOR MOTOR (+)	
• Connect: EPB Actuator C4206. • Measure the voltage between the EPB module C4205a-3, circuit 32-CG19 (WH/VT), harness side and ground.  N0002891	**Yes** INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** GO to F4 .

• **Is voltage present?**	
F4 CHECK THE EPB ACTUATOR MOTOR (-)	
• Measure the voltage between the EPB module C4205a-2, circuit 33-CG19 (YE/VT), harness side and ground.  • **Is voltage present?**	**Yes** INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** INSTALL a new EPB module. REFER to Parking Brake Module in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test G: DTC C1799: Electronic Parking Brake (EPB) Hall-Effect Circuit Failure

Normal Operation

The electronic parking brake (EPB) actuator contains a Hall-effect sensor, which the EPB module uses to determine how long the EPB motor is required to run during an application or release of the parking brake. The Hall-effect sensor receives power (approximately 2 volts less than the battery voltage) from the EPB module through circuit 7-CG20 (YE/VT). Circuit 8-CG20 (WH/VT) provides a signal to the EPB module and this signal varies between 0 and 4.4 volts when the EPB motor is rotating. The voltage varies due to the presence of a magnetic field, which is being detected by the Hall-effect sensor. Ground to the Hall-effect sensor is supplied by circuit 9-CG20 (BN/VT).

Possible Causes

- circuit 7-CG20 (YE/VT) short to voltage, short to ground, or open
- circuit 8-CG20 (WH/VT) short to voltage, short to ground, or open
- circuit 9-CG20 (BN/VT) short to voltage, short to ground, or open
- EPB actuator
- EPB module

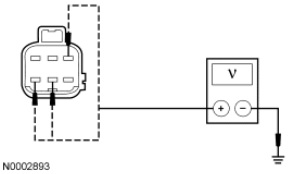
PINPOINT TEST G: DTC C1799: ELECTRONIC PARKING BRAKE (EPB) HALL CIRCUIT EFFECT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
G1 CHECK THE HALL-EFFECT CIRCUITS FOR A SHORT TO VOLTAGE	
• Disconnect: EPB Module C4205b. • Disconnect: EPB Actuator C4206. • Measure the voltage between the EPB actuator C4206 circuits, harness side and ground as follows:	**Yes** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No**

	GO to G2 .

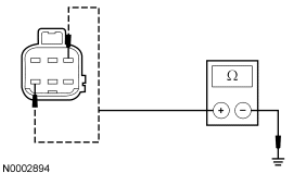
Circuit	Pin	Function
7-CG20 (YE/VT)	3	Hall-effect voltage
8-CG20 (WH/VT)	4	Hall-effect signal
9-CG20 (BN/WH)	5	Hall-effect ground



- **Is any voltage present?**

G2 CHECK THE HALL-EFFECT CIRCUITS FOR A SHORT TO GROUND	
• Measure the resistance between the EPB actuator C4206 circuits, harness side and ground as follows:	**Yes** GO to G3 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Circuit	Pin	Function
7-CG20 (YE/VT)	3	Hall-effect voltage
8-CG20 (WH/VT)	4	Hall-effect signal

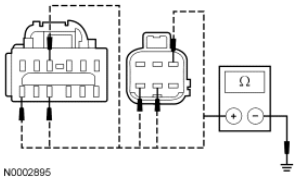


- **Are the resistances greater than 10,000 ohms?**

G3 CHECK THE HALL-EFFECT CIRCUITS FOR AN OPEN	
• Measure the resistance between the EPB actuator C4206 circuits, harness side and the EPB module C4205b circuits, harness side as follows:	**Yes** GO to G4 . **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Circuit	EPB Actuator Pin	EPB Module Pin
	3	10

7-CG20 (YE/VT)		
8-CG20 (WH/VT)	4	4
9-CG20 (BN/WH)	5	12

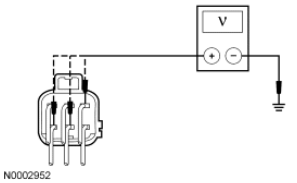


- **Is the resistance less than 5 ohms?**

G4 CHECK THE HALL-EFFECT CIRCUITS FOR A SHORT TO VOLTAGE WITH THE EBP ACTUATOR CONNECTED

- Connect: EPB Actuator C4206.
- Measure the voltage between the EPB actuator C4206 circuits, harness side and ground as follows:

Circuit	Pin	Function
7-CG20 (YE/VT)	3	Hall-effect voltage
8-CG20 (WH/VT)	4	Hall-effect signal
9-CG20 (BN/WH)	5	Hall-effect ground



- **Is any voltage present?**

Yes
INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

No
GO to G5 .

G5 CHECK THE HALL-EFFECT CIRCUITS FOR A SHORT TO GROUND WITH THE EBP ACTUATOR CONNECTED

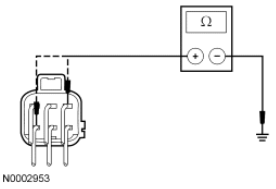
- Measure the resistance between the EPB actuator C4206 circuits, harness side and ground as follows:

Circuit	Pin	Function
7-CG20 (YE/VT)	3	Hall-effect voltage

Yes
GO to G6 .

No
INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

8-CG20 (WH/VT)	4	Hall-effect signal



- **Is the resistance greater than 10,000 ohms?**

G6 CHECK THE HALL-EFFECT CIRCUITS FOR AN OPEN WITH THE EBP ACTUATOR CONNECTED	
• Measure the resistance between the EPB actuator C4206 circuits, harness side and the EPB module C4205b circuits, harness side as follows: **Circuit / EPB Actuator Pin / EPB Module Pin** 7-CG20 (YE/VT): 3 / 10 8-CG20 (WH/VT): 4 / 4 9-CG20 (BN/WH): 5 / 12  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** REPAIR the affected circuit(s). CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test H: DTCS C1801, C1802 AND C1803: Electronic Parking Brake (EPB) Actuator Apply/Release Faults

Normal Operation

The electronic parking brake (EPB) system applies and releases the parking brake cables using an electric motor and gear connected to the parking brake cables. The cable ends are connected to the rear disc brake caliper lever. The lever applies and releases the brake piston toward or away from the rear disc.

Possible Causes

- parking brake cables
- rear disc brake caliper
- EPB module

PINPOINT TEST H: DTCS C1801, C1802 AND C1803: EPB ACTUATOR APPLY/RELEASE FAULTS

Test Step	Result / Action to Take
H1 CHECK THE LH AND RH PARKING BRAKE CABLE AND CONDUIT	
• Check the parking brake cable and conduit for binding, damage, stretching, and correct routing. For correct parking brake cable routing, refer to Parking Brake Cable in this section. • Check that the correct parking brake cables are installed on the correct side of the vehicle. • **Are the parking brake cables OK?**	**Yes** GO to H2 . **No** REPAIR or INSTALL new parking brake components as necessary. CLEAR the DTCs. REPEAT the self-test. RESET the parking brake system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
H2 CHECK THE REAR DISC BRAKE CALIPER LEVERS	
• Inspect the brake caliper. Be sure that there is no corrosion, dirt, or damage that could cause the rear disc brake caliper to bind. • **Is the rear disc brake caliper OK?**	**Yes** INSTALL a new EPB actuator. REFER to Parking Brake Actuator in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** INSTALL a new rear disc brake caliper. REFER to Section 206-04 . CLEAR the DTC(s). REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test I: DTCS C1987/C1988: Yellow Electronic Parking Brake (EPB) Fault Warning Indicator Short To Battery/Circuit Failure

Normal Operation

The yellow electronic parking brake (EPB) system warning indicator (in the EPB switch) illuminates for 3 seconds at prove-out when the ignition switch is cycled to RUN, and illuminates continuously, even with the ignition switch OFF, when the EPB module has detected a fault in the system and DTCs are present.

Possible Causes

- EPB module
- EPB switch
- central junction box (CJB) fuse 7 (5A)
- circuit 75-CG14 (YE/GN) open
- circuit 31S-CG14 (BK/GN) open, short to voltage, or short to ground

PINPOINT TEST I: DTCS C1987/C1988: YELLOW ELECTRONIC PARKING BRAKE (EPB) FAULT WARNING INDICATOR SHORT TO BATTERY/CIRCUIT FAILURE

Test Step	Result / Action to Take
I1 CHECK THE EPB SWITCH	
• Disconnect: EPB Switch C3218. • Measure the resistance between the EPB switch C3218-6, circuit 31S-CG14 (BK/GN), component side and the EPB switch C3218-7, circuit 75-CG14 (YE/GN), component side.  N0002896 • **Is the resistance less than 15 ohms?**	**Yes** GO to I2 . **No** INSTALL a new EPB switch. REFER to Parking Brake Switch in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
I2 CHECK CIRCUIT 31S-CG14 (BK/GN) FOR A SHORT TO VOLTAGE	
• Disconnect: EPB Module C4205b. • Measure the voltage between the EPB module C4205b-2, circuit 31S-CG14 (BK/GN), harness side and ground.  N0002897 • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** GO to I3 .
I3 CHECK CIRCUIT 31S-CG14 (BK/GN) FOR A SHORT TO GROUND	
• Measure the resistance between the EPB module C4205b-2, circuit 31S-CG14 (BK/GN) harness side and ground; and between the EPB switch C3218-6, circuit 31S-CG14 (BK/GN), harness side and ground.  N0002898 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I4 **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTC(s). RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
I4 CHECK CIRCUIT 31S-CG14 (BK/GN) FOR AN OPEN	

• Disconnect the battery. Refer to Section 414-00 . • Measure the resistance between the EPB module C4205b-2, circuit 31S-CG14 (BK/GN), harness side and the EPB switch C3218-6, circuit 31S-CG14 (BK/GN), harness side.  N0002980 • **Is the resistance less than 5 ohms?**	**Yes** GO to I5 . **No** REPAIR the circuit. REPEAT the self-test. CLEAR the DTC(s). RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
I5 CHECK CIRCUIT 75-CG14 (YE/GN) FOR AN OPEN	
• Measure the resistance between the EPB switch C3218-7, circuit 75-CG14 (YE/GN), harness side and the CJB fuse 7 (5A) output cavity.  N0002899 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new EPB module. REFER to Parking Brake Module in this section. CLEAR the DTC(s). REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** REPAIR the circuit. CLEAR the DTC(s). REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test J: DTC C1989: Park Brake Apply And Release Switch Contacts Energized Simultaneously

Normal Operation

The electronic parking brake (EPB) 2-way motor receives power from circuit 32-CG19 (WH/VT) or 33-CG19 (YE/VT), depending on the direction of the motor revolution. When the EPB is applied, circuit 32-CG19 (WH/VT) is equal to the battery voltage and circuit 33-CG19 (YE/VT) is equal to 0 volts. When the EPB is released, 32-CR19 (YE/VT) is equal to 0 volts and 33-CT19 (YE/VT) is equal to battery voltage. Otherwise, both circuits are at one half of the battery voltage.

Possible Causes

- 8-CG15 (WH/BU) short
- 10-CG15 (GY/VT) short
- 9-CG20 (BN/WH) short
- EPB switch
- EPB module

PINPOINT TEST J: C1989: PARK BRAKE APPLY AND RELEASE SWITCH CONTACTS ENERGIZED SIMULTANEOUSLY

<table>
<tr><th>Test Step</th><th>Result / Action to Take</th></tr>

</table>

Pinpoint Test K: DTC C1408/C1409: Parking Brake Apply/Release Switch Circuit Out Of Range

Normal Operation

The electronic parking brake (EPB) switch circuits 8-CG15 (WH/BU) and 10-CG15 (GY/VT) receive a reference voltage from the EPB module when the switch is in its neutral position. This voltage is between 3.5 and 4.5 volts. When the switch contacts close on the apply or release side, a resistor inside the switch is shorted, causing the voltage on circuits 8-CG15 (WH/BU) or 10 CG15 (GY/VT) to change from 1.5 to 3.0 volts. When the EPB module receives this voltage range on the apply or release circuit, an output signal is generated to the actuator to apply or release the EPB.

Possible Causes

- EPB switch
- circuit 8-CG15 (WH/BU) open
- circuit 10-CG15 (GY/VT) open
- EPB module

PINPOINT TEST K: DTC C1408/C1409: PARKING BRAKE APPLY/RELEASE SWITCH CIRCUIT OUT OF RANGE

NOTE: If DTC C1408 is retrieved, go to Step 1. If DTC C1409 is retrieved, go to Step 2.

Test Step	Result / Action to Take
K1 CHECK THE PARKING BRAKE SWITCH APPLY/RELEASE OUTPUT	
• Measure the voltage between the electronic parking brake (EPB) switch C3218-8, circuit 8-CG15 (WH/BU), harness side and the EBP switch C3218-5, circuit 9-CG15 (BN/BU), harness side while pulling the EPB switch up from its rest position.  N0002955 • Measure the voltage between the EPB switch C3218-4, circuit 10-CG15 (GY/VT), harness side and the EBP switch C3218-5, circuit 9-CG15 (BN/BU), harness side while pushing the EPB switch down from its rest position.  N0002956 • **Do the voltages change from 3.5-4.5 volts (idle range) to 1.5-3.0 volts (switch active range)?**	**Yes** If the EPB switch apply voltage is within range, GO to K2 . If the EPB switch release voltage is within range, GO to K3 . **No** INSTALL a new EPB switch. REFER to Parking Brake Switch in this section. RESET the parking brake system. REFER to Electronic Parking Brake (EPB) Resetting in this section. CLEAR the DTCs. REPEAT the self-test.
K2 CHECK CIRCUIT 8-CG15 (WH/BU) FOR AN OPEN	

• Disconnect the battery. Refer to Section 414-00 . • Disconnect: EPB Switch C3218. • Disconnect: EPB Module C4205b. • Measure the resistance between the EPB switch C3218-8, circuit 8-CG15 (WH/BU), harness side and the EPB module C4205b-5, circuit 8-CG15 (WH/BU), harness side.  N0002969 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new EPB switch. REFER to Parking Brake Switch in this section. RESET the parking brake system. REFER to Electronic Parking Brake (EPB) Resetting in this section. CLEAR the DTCs. REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
K3 CHECK CIRCUIT 10-CG15 (GY/VT) FOR AN OPEN	
• Disconnect: EPB Switch C3218. • Disconnect: EPB Module C4205b. • Measure the resistance between the EPB switch C3218-4, circuit 10-CG15 (GY/VT), harness side and the EPB module C4205b-6, circuit 10-CG15 (GY/VT) harness side.  N0002970 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new EPB module. REFER to Parking Brake Module in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. RESET the parking brake system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Pinpoint Test L: DTCs U1027, U1040, U1051, U1058, and U1134

Normal Operation

The electronic parking brake (EPB) module receives module inputs from the anti-lock brake system (ABS) module, the powertrain control module (PCM), and the instrument cluster through the standard corporate protocol (SCP) network.

Possible Causes

- ABS module
- PCM
- instrument cluster
- ingition switch
- EPB module

PINPOINT TEST L: DTCs U1027, U1040, U1051, U1058, AND U1134

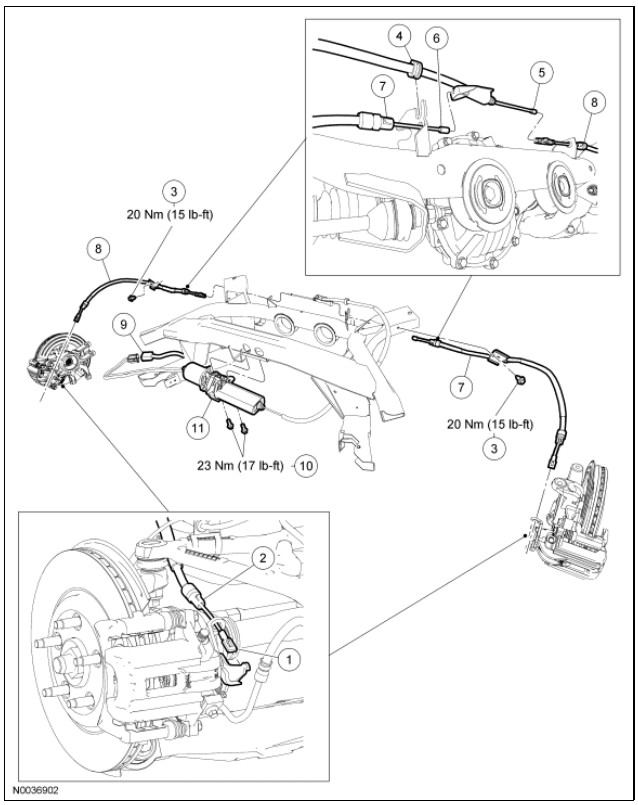
Test Step	Result / Action to Take
L1 RETRIEVE THE RECORDED DTCS FROM BOTH THE CONTINUOUS AND ON-DEMAND SELF-TESTS SPEED CONTROL ACTUATOR	
• Check for recorded speed control actuator DTCs from the continuous and on-demand self-test. • **Are any DTCs recorded?**	**Yes** For DTC U1027, GO to L2 . For DTC U1040, GO to L3 . For DTC U1051, GO to L4 . For DTC U1058, GO to L5 . For DTC U1134, GO to L6 . **No** Go to the Symptom Chart in this section.
L2 MONITOR THE ENGINE RPM	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PCM PID. • Monitor the powertrain control module (PCM) engine RPM PID. • **Do the PID values agree with the engine RPM?**	**Yes** GO to L7 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue diagnosis of the engine speed.
L3 MONITOR THE VEHICLE SPEED SENSOR (VSS) SIGNAL	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: ABS PID. • Monitor the anti-lock brake system (ABS) module VSS signal PID. • **Do the PID values agree with the speed signal?**	**Yes** GO to L7 . **No** REFER to Section 206-09 to continue diagnosis of the VSS signal.
L4 MONITOR THE ABS MODULE STOPLAMP SWITCH	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: ABS Module PID. • Check the speed control actuator for correct operation by monitoring the ABS stoplamp switch signal PID. • **Do the PID values agree with the stoplamp switch signal?**	**Yes** GO to L7 . **No** REFER to Section 206-09 to continue diagnosis of the stoplamps.
L5 MONITOR THE PRNDL	

• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: PCM PID. • Monitor the PCM digital transmission range (TR) sensor PID while selecting different gear positions. • **Do the PID values agree with the PRNDL display?**	**Yes** GO to L7 . **No** REFER to Section 307-01 to continue diagnosis of the digital TR sensor.
L6 MONITOR THE IGNITION SWITCH PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster PID. • Monitor the instrument cluster ignition switch PID while selecting different switch positions. • **Do the PID values agree with the switch position?**	**Yes** GO to L7 . **No** REFER to Section 211-05 to continue diagnosis of the ignition switch.
L7 CHECK FOR CORRECT EPB MODULE OPERATION	

• Disconnect the EPB module connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect the EPB module connectors and make sure it seats correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new EPB module. REFER to Parking Brake Module in this section. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test. RESET the EPB system. REFER to Electronic Parking Brake (EPB) Resetting in this section.

Parking Brake Exploded View

Printable View (189 KB)



Item	Part Number	Description

Parking Brake Cable

Printable View (47 KB)

Removal

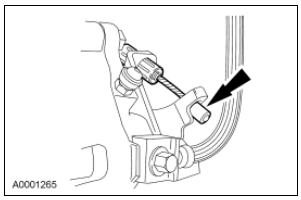
NOTE: LH shown, RH is similar.

1. Release the tension on the parking brake cables by, connecting the diagnostic tool to the vehicle and following the diagnostic tool instructions to slacken the electronic parking brake cables.

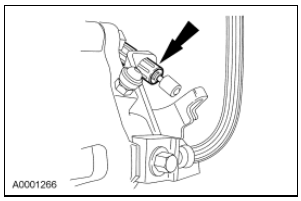
2. Separate the parking brake cable and conduit from the parking brake equalizer.

3. Release the parking brake cable and conduit from the subframe.

4. Release the parking brake cable end from the brake caliper parking brake lever.



5. Release and separate the parking brake cable and conduit from the brake caliper.



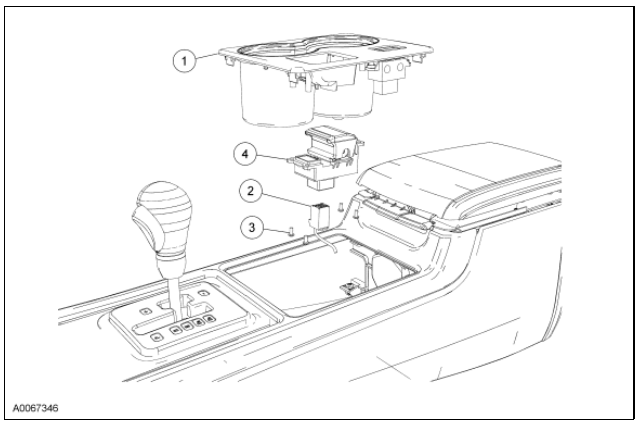
6. Remove the parking brake cable and conduit bracket bolt.
   - To install, tighten to 20 Nm (15 lb-ft).

7. Remove the parking brake cable and conduit from the vehicle.

8. To install, reverse the removal procedure.

Parking Brake Switch

Printable View (79 KB)



Item	Part Number	Description
1	13562	Floor console finish panel cup holder
2		Parking brake switch electrical connector
3		Parking brake switch screws (4 required)
4	2B623	Parking brake switch

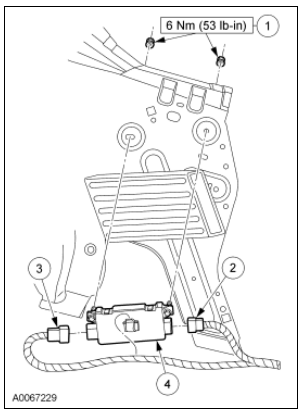
Removal and Installation

NOTE: The electronic parking brake (EPB) system must be reset following the EPB system reset procedure if the battery has been disconnected. Refer to Electronic Parking Brake (EPB) Resetting in the diagnostic section.

1. Disconnect the battery. For additional information, refer to Section 414-01 .
2. Release the floor console finish panel cup holder from the floor console finish panel and position it aside.
3. Disconnect the parking brake switch electrical connector from the parking brake switch.
4. Remove the 4 parking brake switch screws.
5. Release the parking brake switch from the floor console finish panel cup holder.
6. To install, reverse the removal procedure.

Parking Brake Module

Printable View (53 KB)



Item	Part Number	Description
1	W705790-S301	Electronic parking brake (EPB) module nuts (2 required)
2		EPB module electrical connector
3		EPB module electrical connector
4	2C496	EPB module

Removal

NOTE: If installing a new EPB module, the module must be configured. Follow the diagnostic tool instructions for configuring the EPB module. For additional information, refer to Section 418-01 .

1. Disconnect the battery. For additional information, refer to Section 414-01 .

2. Position the LH luggage compartment trim panel aside.

3. Disconnect the 2 EPB module electrical connectors.

4. Remove the 2 nuts and the EPB module.
   - To install, tighten to 6 Nm (53 lb-in).

5. To install, reverse the removal procedure.
   - If installing a new EPB module, configure the module. For configuration additional information, refer to Section 418-01 .

Parking Brake Actuator

Printable View (9 KB)

Removal

NOTE: The electronic parking brake (EPB) system must be reset following the EPB system reset procedure if the battery has been discontinued. Refer to Electronic Parking Brake (EPB) Resetting in the diagnostic section.

1. Release the tension on the parking brake cables by connecting the diagnostic tool to the vehicle and following the diagnostic tool instructions to slacken the EPB cables.

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Separate the EPB actuator cable from the parking brake cable and conduits at the equalizer.

4. Release the EPB actuator cable grommet from the subframe.

5. Disconnect the EPB actuator electrical connector.

6. Remove the 2 EPB actuator assembly bolts.
   - To install, tighten to 23 Nm (17 lb-ft).

7. To install, reverse the removal procedure.

Brake master cylinder nuts	32	24	
Power adjustable pedal motor screws	2		18

Hydraulic Brake Actuation

Printable View (8 KB)

The brake system consists of the following components:

- a vacuum-assisted power braking system
- a power adjustable brake pedal with memory function, if equipped.
- a diagonal split hydraulic system
- a 4-wheel anti-lock brake system (4WABS) available in 2 variants: 4WABS with Traction Control or 4WABS with Traction Control and Stability Assist (also referred to as Interactive Vehicle Dynamics [IVD] or Advance Trac). For additional information, refer to Section 206-09 .

Adjustable Pedals

The vehicle may be equipped with an adjustable brake and accelerator pedal system. Using the adjustable pedal switch, located on the instrument panel, the driver can adjust the brake and accelerator pedals for a more comfortable driving position.

Memory Adjustable Pedal Operation

The power adjustable pedals memory feature stores the current accelerator and brake pedal positions and recalls the previously stored pedal positions for a specified driver as directed by the memory feature. The adjustable pedals with memory feature:

- are operational with the ignition switch ON or OFF.
- can be adjusted forward or rearward using the adjustable pedal switch.
- retains 2 separate driver's pedal positions.
- updates the retained pedal position when that driver's memory is stored.
- moves the pedal to the retained pedal position when that driver's memory is recalled.
- stops pedal movement when any manual actuation of the pedal adjustment switch occurs while memory recall is moving the pedal.

Hydraulic Brake Actuation

Printable View (7 KB)

Refer to Section 206-00 .

Adjustable Pedal Indexing

Printable View (127 KB)

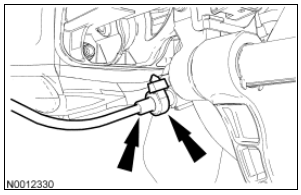
⚠ CAUTION: The adjustable pedal system must be indexed whenever the brake pedal assembly or accelerator pedal assembly is serviced.

1. Make sure the electrical connector is connected to the adjustable pedal motor.

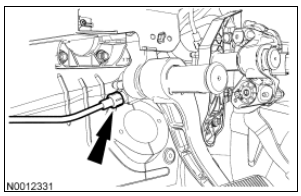
2. **NOTE:** A new adjustable brake pedal or adjustable accelerator pedal assembly will be in the full forward (towards the front of the vehicle) position.

   Operate the adjustable pedal to the full forward position. If the adjustable accelerator pedal bottoms before the adjustable brake pedal, operate both adjustable pedals full rearward.

3. Remove the tie-strap, if necessary, and disconnect the drive cable assembly from the adjustable brake pedal drive. Continue to operate the adjustable accelerator pedal to the full rearward position.

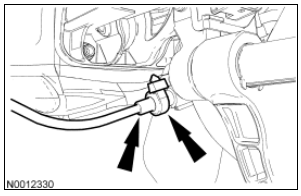


4. Connect the drive cable assembly to the adjustable brake pedal drive.

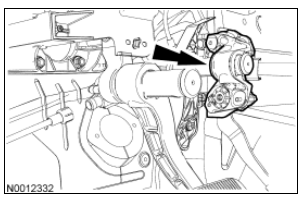


5. Operate both the adjustable pedals to the full forward position.

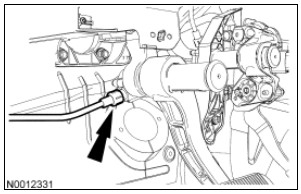
6. If the adjustable brake pedal bottoms before the adjustable accelerator pedal, remove the tie-strap, if necessary, and disconnect the adjustable brake pedal drive cable.



7. Operate the accelerator pedal to the full forward position.



8. Connect the drive cable assembly to the adjustable brake pedal drive.

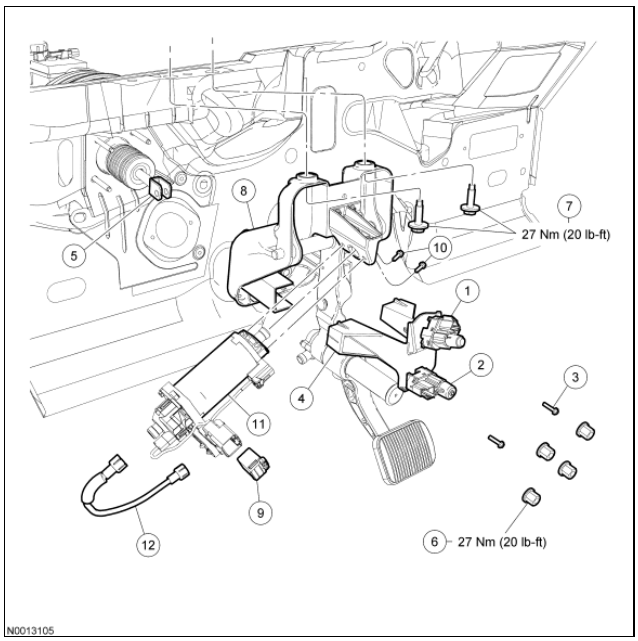


9. Operate both the adjustable pedals to the full forward position.

10. Check that the adjustable brake pedal and adjustable accelerator pedal can be adjusted fully forward, fully rearward, and they hit the forward and rearward stops at the same time.

Brake Pedal and Bracket

Printable View (166 KB)



Item	Part Number	Description
1	13480	Stoplamp switch
2	9F924	Speed control deactivator switch electrical connector
3		Switch bracket screws (2 required)
4	2C433	Switch bracket
5		Brake booster rod
6	385759-S59	Brake booster nuts (4 required)
7	N806528-S58	Brake pedal bracket bolts (2 required)
8	2450	Brake pedal bracket (fixed/adjustable)
9		Adjustable brake pedal motor electrical connector
10		Adjustable brake pedal motor screws (2 required)
11	2C429	Adjustable brake pedal motor
12	2C431	Adjustable brake pedal drive cable

Removal and Installation

NOTE: The adjustable pedal assembly is shown; the fixed pedal assembly is similar.

1. Remove the steering column. For additional information, refer to Section 211-04 .
2. Remove the speed control deactivator switch. For additional information, refer to Section 310-03 .
3. Remove the stoplamp switch. For additional information, refer to Section 417-01 .
4. Remove the 2 switch bracket screws and position the switch bracket aside.
5. Remove the self-locking clip from the brake booster rod pin.

6. Remove the brake booster rod pin from the brake booster rod.

7. Position the brake pedal booster rod and bushing off the brake pedal.

8. If equipped with adjustable pedals, disconnect the adjustable pedal motor electrical connector.

9. Remove the 4 brake booster nuts.
    - To install, tighten to 27 Nm (20 lb-ft).

10. Remove the 2 upper brake pedal bracket bolts.
    - To install, tighten to 27 Nm (20 lb-ft).

11. Remove the brake pedal and bracket assembly from the vehicle.

12. To install, reverse the removal procedure.

Brake Pedal Motor

Printable View (7 KB)

Removal and Installation

1. Remove the steering column. For additional information, refer to Section 211-04 .
2. Remove the 2 adjustable pedal motor screws and release the drive cable assemblies from the adjustable pedal motor.
3. Disconnect the adjustable pedal motor electrical connector.
4. Remove the adjustable pedal motor.
5. To install, reverse the removal procedure.

Brake Pedal Motor Cable

Printable View (7 KB)

Removal and Installation

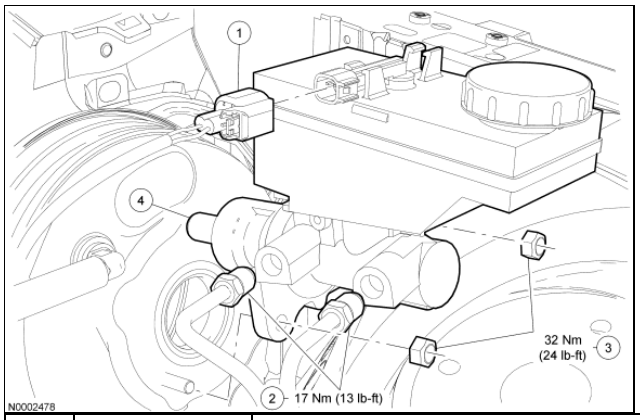
1. Remove the steering column. For additional information, refer to Section 211-04 .
2. Disconnect the drive cable assemblies from the brake pedal transmission.
3. Release the cable assembly from the adjustable pedal motor.
4. To install, reverse the removal procedure.

Brake Master Cylinder

Printable View (126 KB)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A



Item	Part Number	Description
1		Brake fluid level warning switch electrical connector (part of 14289)
2	2C326	Brake line fittings (2 required)
3	382802-S191	Master cylinder nuts (2 required)
4	2140	Brake master cylinder/reservoir assembly

Removal and Installation

1. If equipped with interactive vehicle dynamics (IVD), disconnect the brake master cylinder pressure switch electrical connector.

2. Disconnect the brake fluid level switch electrical connector.

3. **NOTE:** Cap the brake line and plug the master cylinder ports after disconnecting the brake line fittings.

   Disconnect the brake line fittings.

   - To install, tighten to 17 Nm (13 lb-ft)

4. Remove the 2 brake master cylinder nuts.
   - To install, tighten to 32 Nm (24 lb-ft).

5. Remove the brake master cylinder.

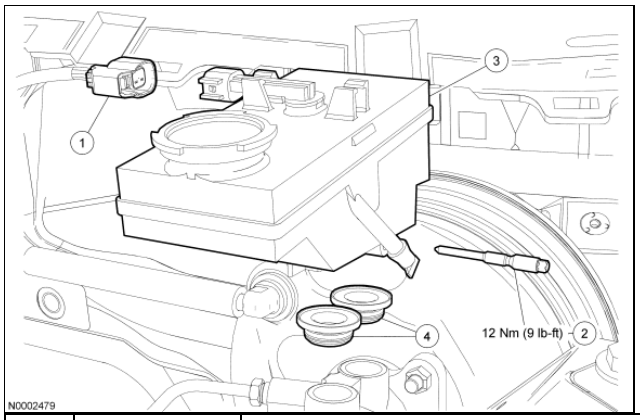
6. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to Section 206-00 .

Brake Fluid Reservoir

Printable View (115 KB)

Material

Item	Specification
High Performance DOT 3 Motor Vehicle Brake Fluid PM-1 (Canada CPM-1)	ESA-M6C25-A



Item	Part Number	Description
1		Brake fluid level warning switch electrical connector (part of 14289)
2	2462	Brake fluid reservoir retainer screw
3	2K478	Brake fluid reservoir
4		Brake fluid reservoir seals (2 required)

Removal and Installation

1. Use a suitable suction device to drain the reservoir before removal.

2. Disconnect the brake fluid level switch electrical connector.

3. Remove the brake fluid reservoir retaining screw.
   - To install, tighten to 12 Nm (9 lb-ft).

4. Remove the brake fluid reservoir.

5. To install, reverse the removal procedure.

Printable View (7 KB)

Torque Specifications

Description	Nm	lb-ft
Brake booster nut	27	20
Degas bottle bolt	15	11
Strut tower support brace bolt	20	15
Vapor management valve nut	28	21
Windshield wiper pivot arm nut	25	18

Power Brake System

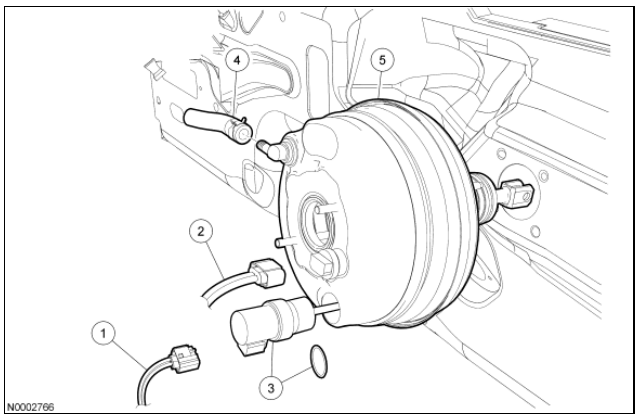
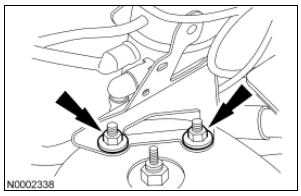
Brake Booster

Printable View (274 KB)

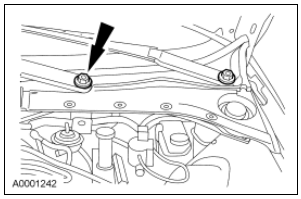


Item	Part Number	Description
1		Brake pedal travel switch (PTS) electical connector (vehicles with Interactive Vehicle Dynamics [IVD])
2		Brake pedal force switch electrical connector (vehicles with IVD)
3		PTS and O-ring (vehicles with IVD)
4	2C429	Vacuum hose
5	2005	Brake booster assembly (vehicles with or without IVD)

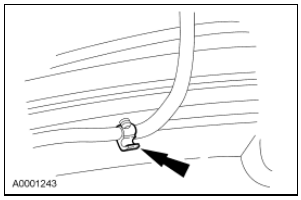
1. Remove the 2 nuts and position the vapor management valve (VMV) and bracket assembly aside.
   - To install, tighten to 28 Nm (21 lb-ft).



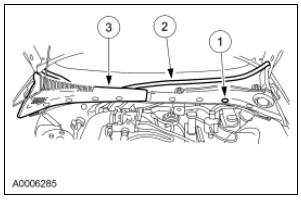
2. Remove the 2 nuts and the 2 windshield wiper pivot arms.
   - To install, tighten to 25 Nm (18 lb-ft).



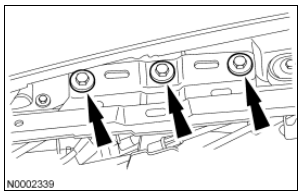
3. Disconnect the windshield washer hose.



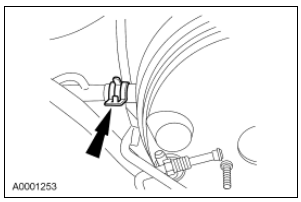
4. Remove the cowl panel grille.
    1. Remove the cowl panel grille pin-type retainers.
    2. Remove the cowl panel grille rubber trim.
    3. Remove the cowl panel grille.



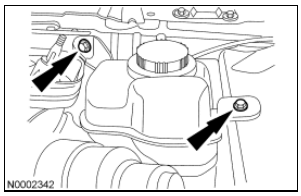
5. Remove the 7 bolts and the strut tower support brace.
    - To install, tighten to 20 Nm (15 lb-ft)



6. Disconnect the degas bottle return hose.



7. Remove the 2 degas bottle bolts and position the degas bottle aside.
    - To install, tighten to 15 Nm (11 lb-ft).

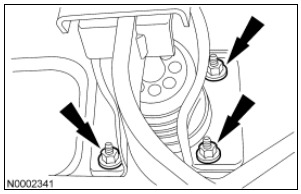


8. Remove the brake master cylinder. For additional information, refer to Section 206-06 .

9. If equipped, disconnect the brake pedal travel switch and the brake pedal force switch electical connectors.

10. Disconnect the brake booster vacuum hose from the vacuum check valve.

11. Remove and discard the 4 brake booster-to-brake pedal bracket nuts.
    - To install, tighten to 27 Nm (20 lb-ft).



12. Disconnect the brake pedal pin from the brake booster input shaft.
    1. Remove the redundent self-locking clip.
    2. Disconnect the booster rod from the brake pedal.

13. Remove the brake booster from the vehicle.

14. To install, reverse the removal procedure.

Anti-Lock Control

Printable View (9 KB)

Anti-Lock Brake System (ABS) with Traction Control

The anti-lock brake system (ABS) with Traction Control consists of the following components:

- hydraulic control unit (HCU)
- anti-lock brake system (ABS) module
- rear wheel speed sensors
- rear wheel speed sensor ring (integral to the halfshaft)
- front wheel speed sensors
- front wheel speed sensor rings (integral to the hub and bearing assembly)
- stability assist/traction control switch
- yellow ABS warning indicator
- stability assist/traction control active/fail warning lamp

The front wheel speed sensor rings are integral to the front hub and bearing assemblies. For additional information, refer to Section 204-01 .

The rear wheel speed sensor rings are integral to the rear halfshaft. For additional information, refer to Section 205-05 .

Anti-Lock Brake System (ABS) With Traction Control and Stability Assist

The anti-lock brake system (ABS) with Traction Control Stability Assist consists of these additional components:

- yaw rate sensor (contains the accelerometer(s) and is also known as the Sensor cluster)
- steering wheel rotation sensor
- active brake booster
    - ♦ master cylinder pressure sensor
    - ♦ pedal travel sensor
    - ♦ brake pedal force switch

The front wheel speed sensor rings are integral to the front hub and bearing assemblies. For additional information, refer to Section 204-01 .

The rear wheel speed sensor rings are integral to the rear halfshaft. For additional information, refer to Section 205-05 .

Anti-Lock Control

Printable View (619 KB)

Refer to Wiring Diagrams Cell 42 for schematic and connector information.

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool
ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST1177-A	88 Digital Multimeter 105-R0053 or equivalent
ST2574-A	Flex Probe Kit 105-R025B

Principles of Operation

Anti-Lock Brake System (ABS)

The anti-lock brake control module manages anti-lock braking, while the anti-lock brake control module with stability assist manages anti-lock braking, traction control, and engine control systems to maintain vehicle control during deceleration and acceleration.

When the ignition switch is in the RUN position, the module will do a preliminary electrical check, and at approximately 20 km/h (12 mph), the hydraulic pump motor is turned on for approximately 1/2-second. Any malfunction of the anti-lock brake control system will disable the stability assist and the anti-lock brake warning indicator will illuminate. However, the power-assist braking system will function normally.

Electronic Brake Distribution (EBD)

The EBD controls rear brake pressure and acts as an electronic proportioning valve. It is controlled by the ABS module. When EBD is disabled, the amber ABS and the red brake warning indicators will illuminate.

Panic Assist Braking (ABS With Traction Control)

Panic assist braking functions by fully applying the brakes during a panic stop, using a specially developed pressure/pedal movement mechanism. Depending on vehicle speed, if pedal stroke is more rapid than normal, the brake booster automatically applies full brake boost. Panic assist will be disabled when the driver releases the brake pedal.

Panic Assist Braking (ABS With Stability Control)

Panic assist braking functions by fully applying the brakes during a panic stop, using the active brake booster. The ABS module continuously monitors the pedal travel sensor and when a pedal stroke is more rapid than normal, the ABS module will energize the solenoid in the brake booster to apply full brake boost. Panic assist will be disabled when the driver releases the brake pedal.

Stability Assist

With the ignition in the START or RUN positions, the stability assist module functions similarly to a conventional anti-lock brake module by monitoring and comparing the rotational speed of each wheel. Wheel speeds are measured by the wheel speed sensor which electrically senses each tooth of the anti-lock sensor ring as they pass through the sensor's magnetic field. When the stability assist module detects an impending wheel lock, wheel spin or vehicle motion that is inconsistent with the driver commands, brake pressure is modulated to the appropriate brake caliper(s). The stability assist module triggers the hydraulic control unit (HCU) to open and close the appropriate solenoid valves. Once the affected wheel(s) return to the desired speed, the stability assist module returns the solenoid valves to their normal position, and normal base brake operation is restored.

The ABS module communicates with the powertrain control module (PCM) to assist with traction control. At speeds under 100 km/h (62 mph), when the drive wheels lose traction and begin to spin, the stability assist module requests the PCM to reduce engine torque while simultaneously applying and releasing the appropriate brake caliper(s) to maintain traction. The PCM accomplishes this by minor incremental timing changes and fewer fuel injector pulses until the stability assist module ends the request. The request ends when the driven wheel speed returns to the desired speed. After the vehicle speed exceeds 100 km/h (62 mph), the traction control is accomplished only through the PCM torque control.

The stability assist system constantly monitors vehicle motion relative to the driver's intended course. This is done by using sensors to compare the driver's steering input and brake application with that of the actual vehicle motion. The system does not activate when the vehicle is traveling in reverse; however, ABS and traction control will continue to function as usual.

The stability assist control switch allows the driver to control use of the stability assist system. This is independent of the ABS function, which cannot be switched off by the driver. The stability assist system status is indicated by a stability assist warning lamp in the Stability assist/traction control switch. An illuminated Stability assist/traction control switch indicates that the stability assist system is switched off. In vehicles with a message center, the message AdvTrac Off, T/C ON is displayed. The anti-lock brake function continues to work as designed unless the yellow anti-lock brake warning indicator is also illuminated. Normal braking function always occurs, unless the red brake warning indicator is illuminated.

When stability assist activates, any of the following can occur:

- a rumble or grinding sound much like ABS or traction control
- a small deceleration or a reduction in the acceleration of the vehicle
- the stability assist indicator will flash
- if the driver's foot is on the brake pedal, a vibration will be felt in the pedal much like ABS
- if the event is severe and the driver's foot is not on the brake, the brake pedal will move to apply higher brake forces. A whooshing sound can also be heard from under the instrument panel in an event this severe.

Some drivers may notice a slight movement of the brake pedal when the system checks itself. The brake pedal moves when an active test of the brake booster is run. During this test a small amount of pressure will be generated at the master cylinder, but no pressure will be generated in the brake calipers.

Sensor Cluster (ABS With Stability Assist)

The sensor cluster (also called the yaw rate sensor) consists of the longitudinal and lateral accelerometer. The lateral accelerometer measures the acceleration which corresponds to the force involved when the vehicle slides sideways. This acceleration has 2 forms. The first is the centrifugal acceleration which is generated when the vehicle travels around in a circle. The second is the acceleration due to gravity. On level ground there is no contribution from this acceleration. However, if the vehicle is parked sideways on a bank or incline, the sensor will measure some lateral acceleration due to gravity even though the vehicle is not moving.

The yaw rate sensor measures the relative vehicle motion about the vertical axis through its center of gravity.

Steering Wheel Rotation Sensor (ABS With Stability Assist)

The steering wheel rotation sensor measures the rate of rotation of the steering wheel by monitoring the steering wheel rotation ring as it passes through the sensor gap. The steering wheel rotation sensor uses 2 signal lines to transmit information to the stability assist module, whether the steering wheel is being turned left or right and how far it is being turned. The steering wheel rotation sensor does not indicate the position of the steering wheel relative to straight-ahead. The stability assist system learns this position by comparing the steering wheel position with other signals and storing the position it has learned. The stability assist system confirms this position and modifies it as necessary during every new driving cycle.

Active Brake Booster (ABS With Stability Assist)

The active brake booster functions like a conventional brake booster with the added feature that it can be actuated electrically by the stability assist module. The electrical brake booster actuation is necessary in during panic assist and severe stability assist events. During severe stability assist events, an electrical actuator of the booster ensures that the hydraulic control unit can generate enough brake pressure to maintain vehicle stability. The brake assist from the brake booster is especially useful in cold weather when the hydraulic control unit cannot draw the brake fluid from the reservoir quickly at cold temperatures.

A solenoid within the active brake booster has a brake pedal force switch to indicate when the driver is stepping on the brake pedal. The solenoid provides electrical actuation of the brake booster. Without the force of the input rod, the air valve is directly opened due to the movement of the energized solenoid. With increasing current applied to the solenoid, the air valve opens and output force is created. With decreasing current applied to the solenoid, the air valve is closed and the vacuum valve opens, reducing output force. The brake pedal force switch indicates when the brake pedal has been applied. It is integrated into the booster key that normally sits against the rear shell of the boot in its rest position and it adjoins the valve body when in its balance position. The brake pedal force switch provides indication from 2 positions. In its rest position, it supplies 2 signals, normally open and normally closed. Upon application of sufficient force to initiate movement of the key away from the valve body, the brake pedal force switch changes state, signifying a driver application.

When the stability assist module is activating the brake booster, the brake pedal is pulled forward as the valve body moves. The brake pedal release switch is held in position by the input rod spring and remains against the valve body. Although the brake pedal position (BPP) switch changes state when the brake pedal drops, the brake pedal force switch remains inactive until it encounters an external force from the driver or a stability assist event controlled by the stability assist module.

Modules which are normally connected to the brake pedal position (BPP) switch are connected to a signal from the ABS module. This signal only changes state when the driver has applied the brake. If the ignition switch is in the RUN position, the brake booster is not electrically actuated, and no failure has been detected, the driver brake application signal will indicates a brake applied when the brake pedal force switch built into the brake booster indicate that the driver has applied the brake pedal. If the ignition switch is in the OFF position, the driver brake application signal will indicate a brake apply only when the BPP switch indicates that the driver is applying the brake pedal. When the ignition switch is in the OFF position, failures cannot be

detected. If there are failures, several layers of redundancy try to keep the driver brake application signal accurate. If the ABS module system detects faults on the driver brake application signal line it will also attempt to maintain correct stoplamp operation by communicating on the standard corporate protocol (SCP) network. Control of the stoplamp operation is also required because the BPP switch can change states during a ABS module event when the driver is not applying the brake pedal. The BPP switch can also change states during the system check of the brake booster. Only the ABS module system can interpret these changes and determine which ones are actually due to the driver applying the brake. Similarly, the ABS module system can take advantage of its other sensors to detect failures in the BPP switch.

ABS Module Configuration

The ABS module must be configured when a new ABS module is installed. If installing a new ABS module with stability assist, the calibration procedure as well as the configuration procedure must be carried out. For additional information, refer to Section 418-01 .

ABS Module Calibration (ABS With Stability Assist)

If a new ABS module is installed, it must be configured first. The ABS module also needs to be recalibrated whenever a component specific to the stability assist system is disconnected or a new component is installed. For additional information regarding the diagnostic trouble codes (DTCs) that require the recalibration procedure, refer to the ABS Calibration List. If a DTC is logged for any component of the stability assist system, the DTC must be cleared before carrying out the recalibration procedure. The need to recalibrate the ABS module is also indicated by the stability assist active/fail lamp flashing. The lamp will flash after clearing the DTCs that are indicated on the ABS Calibration List. If a DTC is retrieved after recalibration, refer to the Anti-Lock Brake System (ABS) Module Diagnostic Trouble Code (DTC) Index. If installing a new stability assist module, the calibration procedures as well as the configuration procedure must be carried out. For additional information regarding the module configuration and calibration, follow the diagnostic tool directions for the calibration procedure.

When carrying out the sensor cluster calibration using the diagnostic tool, the vehicle must be on a level surface, must not be moving and the ignition switch must be in the RUN position. When carrying out the steering wheel rotation sensor calibration on the diagnostic tool, the ignition switch must be in the RUN position with the engine running and the steering wheel must be rotated back and forth from lock position to lock position.

Traction Control and Traction Control with Stability Assist

DTC C1963

This diagnostic trouble code (DTC) is stored if the traction control warning indicator has been turned ON because the system could not confirm the straight-ahead position for more than 30 seconds above 18 km/h (11 mph) or if the vehicle reaches 70 kph (43 mph) before confirming the straight-ahead position. This condition will most likely occur if there is some other DTC or if driving aggressively immediately after turning the ignition switch on. If there is another DTC logged, the repair procedure is to follow the procedure for the first DTC. This DTC can be stored if:

- the PRNDL or Reverse switch has failed (check operation of PRNDL display and back-up lights).
- chassis modifications have been made that were not authorized by Ford.

In very rare circumstances this DTC can be stored by itself without the occurrence of any actual component failure. These conditions can cause DTC C1963 to set with no other DTC:

- The steering wheel has been turned while the ignition switch is in the OFF position and then the vehicle is started, and either the vehicle is driven continuously in a circle or the vehicle is driven with continuous swerving, sliding or tire spinning.

- A new traction control module has been installed in the vehicle and is not calibrated.

Inspection and Verification

NOTE: If a module is installed it must be reconfigured. Refer to Section 418-01 .

1. Verify the customer concern by operating the vehicle to duplicate the condition.

2. Verify the stoplamps operate correctly by applying and releasing the brake pedal with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 . If the stoplamps operate correctly, proceed to the next step.

3. Verify that the PRNDL operates correctly on the instrument cluster. If the PRNDL does not operate correctly, refer to Section 413-01 . If the PRNDL operates correctly, proceed to the next step.

4. Inspect to determine if any of the following mechanical or electrical concerns apply.

Visual Inspection Chart

Mechanical	Electrical
• Wheel speed sensor ring • Hydraulic control unit (HCU) • Incorrectly inflated tires • Mismatched wheels or tires on vehicle • Base brake concern • Brake booster vacuum hose • Ford-specified steering components, suspension components and tire size • Steering wheel rotation ring	• Auxiliary battery junction box (AJB) fuse(s): ♦ 14 (30A) ♦ 22 (40A) • ABS module • EVAC and fill connector • Wheel speed sensor • Advance Trac®/IVD switch • PTS switch • Steering wheel rotation sensor • Brake booster solenoid • Brake booster release switch • Brake pressure transducer • Yaw rate sensor (integral to sensor cluster) • Accelerometer (integral to sensor cluster) • Wiring harness • Connectors or connections • Circuitry

5. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connection of the data link connector to the vehicle.
   - check that the ignition switch is in the RUN position.

6. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

7. Carry out the diagnostic tool data link test. If diagnostic tool responds with:
   - SCP or ISO; all electronic control units, no response/not equipped, refer to Section 418-00 .
   - No response/not equipped for the ABS module, Go To Pinpoint Test A .
   - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), clear the continuous DTCs, cycle the ignition switch OFF and ON, then carry out the self-test diagnostics for the ABS module.

8. If the DTCs retrieved are related to the concern, go to Anti-lock Brake System (ABS) (With or Without Advance Trac®/IVD) Module Diagnostic Trouble Code (DTC) Index to continue diagnosis.

9. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue diagnosis.

Anti-lock Brake System (ABS)/Traction Control and ABS/Traction Control with Advance Trac®/IVD Diagnostic Trouble Code (DTC) Index

NOTE: The need to recalibrate the module is indicated by the active/fail lamp flashing. There are other service actions that can require recalibration when there is no flashing lamp. The lamp will flash after clearing the DTCs that are indicated in the module calibration list.

NOTE: Always retrieve the continuous DTCs after running the self-test.

NOTE: For a complete master list of DTCs, refer to Section 419-10 .

Anti-lock Brake System (ABS)/Traction Control and ABS/Traction Control with Advance Trac®/IVD Diagnostic Trouble Code (DTC) Index
NOTE: DTC C1730 (Reference Voltage Out Of Range) must be repaired before DTC C1279, C1280, C1281, C1282, C1288, C1289.

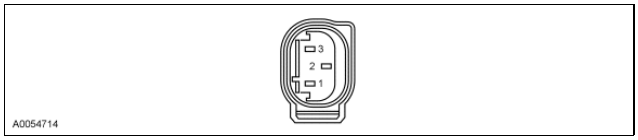
Symptom Chart

Refer to Wiring Diagrams Cell 42 for schematic and connector information.

Symptom Chart

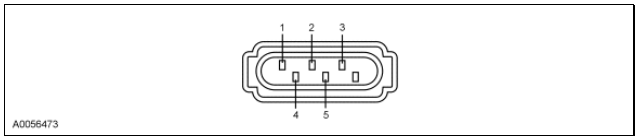
Connector Circuit Reference

Brake Pressure Transducer C147



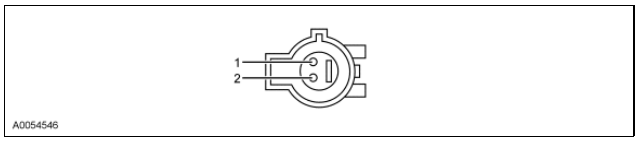
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	9-CF64 (BN/YE) Brake pressure transducer ground	0 volts, less than 5 ohms to chassis ground.
2	8-CF64 (WH/BK) Brake pressure transducer signal	0 to 5 volts, varies proportional to brake pressure.
3	7-CF64 (YE/BK) Brake pressure transducer power	5 volts with ignition ON.

Active Brake Booster C149



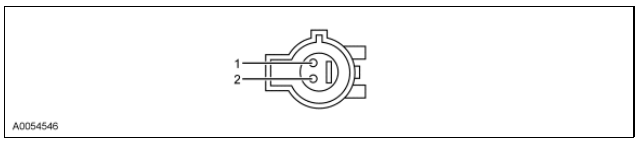
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	8-CF51 (WH/GN) Brake pedal force switch normally open (NO)	Open circuit without brake pedal applied.
2	10-CF51 (GY/OG) Brake pedal force switch normally closed (NC)	Closed circuit without brake pedal applied.
3	9-CF68 (BN/RD) Active brake booster power	5 volts with ignition switch in the ON position.
4	8-CF68 (WH/RD) Active brake booster power	B+ with ignition switch in the ON position.
5	9-CF51 (BN/GN) Brake pedal force switch signal	0 to 5 volts varies with brake pedal application.

LF Wheel Speed Sensor C150



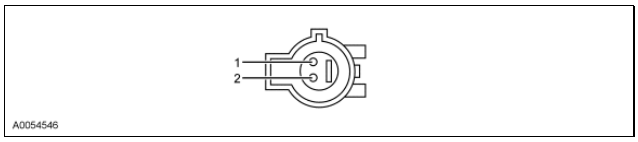
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	7-CF32 (YE) LF wheel speed (+)	PID value 0 to 255 km/h (0 to 158 mph).
2	8-CF32 (WH) LF wheel speed (-)	PID value 0 to 255 km/h (0 to 158 mph).

RF Wheel Speed Sensor C160



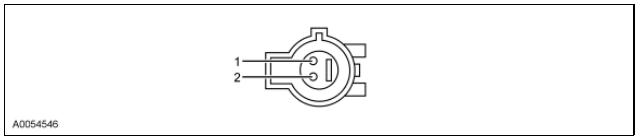
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	7-CF38 (YE/RD) RF wheel speed (+)	PID value 0 to 255 km/h (0 to 158 mph).
2	8-CF38 (WH/RD) RF wheel speed (-)	PID value 0 to 255 km/h (0 to 158 mph).

RR Wheel Speed Sensor C426



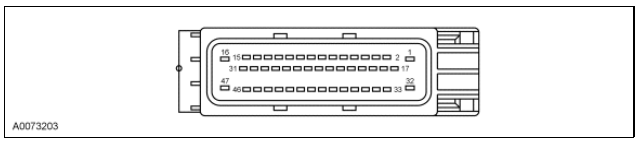
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	7-CF40 (YE/GN) RR wheel speed (+)	PID value 0 to 255 km/h (0 to 158 mph).
2	8-CF40 (WH/GN) RR wheel speed (-)	PID value 0 to 255 km/h (0 to 158 mph).

LR Wheel Speed Sensor C440



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	8-CF34 (WH/BU) LR wheel speed (+)	PID value 0 to 255 km/h (0 to 158 mph).
2	7-CF34 (YE/BU) LR wheel speed (-)	PID value 0 to 255 km/h (0 to 158 mph).

Anti-Lock Brake System (ABS) Connector C155

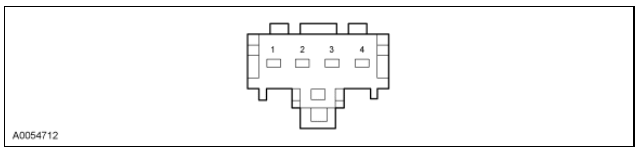


Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	30-CF13 (RD) HCU pump power	B+ voltage at all times.
2	4-EE6 (GY) ISO bus	ISO communication when connected.
3 (ABS)	8-CF63 (WH/GN) Vehicle speed signal	Signal varies with vehicle speed.
3 (ABS with stability assist)	8-CC18 (WH/RD) Steering wheel rotation sensor angle 1	PID value when connected 0° to 45°.
4	30-CF6A (RD/YE) Ignition power	B+ voltage with key ON.
5 (ABS with stability assist)	9-CC1 (BN/RD) Steering wheel rotation/accelerometer/yaw rate sensor return	0 volts, Less than 5 ohms to the chassis ground.
6 (ABS)	8-GN14 (WH/BK) Vehicle speed signal	Signal varies with vehicle speed.
6 (ABS with stability assist)	10-CC17 (GY) Steering wheel rotation sensor angle 2	PID value when connected 0° to -45°.
7		

	7-CC1 (YE/RD) Steering wheel rotation sensor/accelerometer/yaw rate sensor power	Greater than 9 volts with the ignition switch in the START or RUN position.
13	31S-CF45 (BK/GN) Advance Trac®/IVD OFF indicator	0 volts when Advance Trac®/IVD switch is OFF.
14	5-CF6 (BU) SCP Bus (-)	SCP communication low current when connected.
16	31-CF6A (BK/YE) ABS module ground	0 volts, less than 5 ohms to chassis ground.
17	8-CF68 (WH/RD) Active brake booster power	B+ with the ignition switch in the ON position.
18	7-CF64 (YE/BK) Brake pressure transducer power	5 volts with the ignition switch in the RUN position.
19	9-CF64 (BN/YE) Brake pressure transducer ground	0 volts, less than 5 ohms to chassis ground.
20	8-CF64 (WH/BK) Brake pressure transducer signal	0 to 5 volts, varies proportional to brake pressure.
22 (ABS with stability assist)	8-CF63 (WH/GN) Navigation system signal	Signal varies with vehicle speed.
24	9-CF65 (BN/WH) Pedal travel switch (PTS) switch ground	0 volts, less than 5 ohms to chassis ground.
25	5-CF66 (BU/WH) Accelerometer/yaw rate sensor CAN Bus (-)	CAN communication low current when connected.
26	7-CF65 (YE/VT) Pedal travel switch (PTS) switch power	5 volts with ignition switch in the RUN position.
27	8-CF51 (WH/GN) Brake pedal force switch normally open (NO)	Open circuit without brake pedal applied.
28	9-CF51 (BN/GN) Brake pedal force switch signal	0 to 5 volts varies with brake pedal application.
29	4-CF66 (GY/VT) Accelerometer/yaw rate sensor CAN Bus (+)	CAN communication high current when connected.
30	10-CF51 (GY/OG) Brake pedal force switch normally closed (NC)	Closed circuit without brake pedal applied.
31	9-CF68 (BN/RD) Active brake booster power	5 volts with ignition switch in the RUN position.
32	30-CF6A (RD/YE) HCU solenoid valves power	B+ voltage at all times.
33	8-CF38 (WH/RD) RF active wheel speed sensor ground	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
34	7-CF38 (YE/RD) RF active wheel speed sensor power	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
36	7-CF34 (YE/BU) LR active wheel speed sensor power	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
37	8-CF34 (WH/BU) LR active wheel speed sensor ground	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
38		12 volts with Advance Trac®/IVD switch ON.

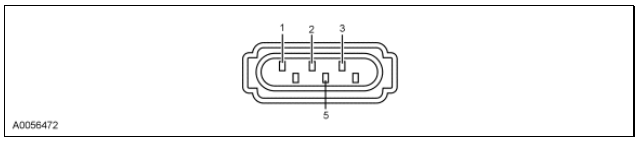
	8-CF54 (WH/VT) Traction Control Actuator/Advance Trac®/IVD switch input	
39	8-GN14 (WH/BK) Backup aid signal	5-volt reference signal to backup aid with transmission selector in R
40	9-CF65 (BN/WH) Pedal travel switch (PTS) switch signal	0 to 5 volts varies with pedal travel switch position.
41 (ABS with stability assist)	29S-CF58 (OG/GN) Brake ON/OFF switch input	0 volts Brake applied, 12 volts brake not applied.
42	8-CF40 (WH/GN) RR active wheel speed sensor ground	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
43	7-CF40 (YE/GN) RR active wheel speed sensor power	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
44	29S-CF2 (OG/BU) Driver brake apply signal power	Brake applied 12 volts to trailer tow relay (if equipped).
45	7-CF32 (YE) LF active wheel speed sensor power	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
46	8-CF32 (WH) LF active wheel speed sensor ground	PID value 0 to 255 km/h (0 to 158 mph); 0 volts, less than 5 ohms to chassis ground when connected.
47	31-CF6B (BK) ABS module ground	0 volts, less than 5 ohms to chassis ground.

Steering Wheel Rotation Sensor C226



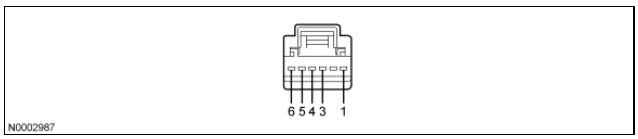
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	7-CC16A (YE/BK) Steering wheel rotation sensor/accelerometer/yaw rate sensor power	Greater than 9 volts with ignition switch in the START or RUN position.
2	10-CC17 (GY) Steering wheel rotation sensor angle 2	PID value when connected 0° to -45°.
3	8-CC18 (WH/RD) Steering wheel rotation sensor angle 1	PID value when connected 0° to 45°.
4	9-CC16 (BN/YE) Steering wheel rotation/accelerometer/yaw rate sensor return	0 volts, less than 5 ohms to chassis ground.

Accelerometer/Yaw Rate Sensor C3073



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	5-CF66 (BU/WH) Accelerometer/yaw rate sensor CAN Bus (-)	CAN communication low current when connected.
2	4-CF66 (GY/VT) Accelerometer/yaw rate sensor CAN Bus (+)	CAN communication high current when connected.
3	7-CF67 (YE/RD) Steering wheel rotation sensor/accelerometer/yaw rate sensor power	Greater than 9 volts with ignition switch in the START or RUN position.
5	9-CF67 (BN/RD) Steering wheel rotation/accelerometer/yaw rate sensor return	0 volts, less than 5 ohms to chassis ground.

Advance Trac®/IVD Switch C3208



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	31S-CF45 (BK/GN) Advance Trac®/IVD OFF signal	Greater than 10 volts with the switch OFF.
3	20-CF54 (PK/WH) Advance Trac®/IVD switch power	Greater than 10 volts on actuation.
4	8-CF54 (WH/VT) Advance Trac®/IVD signal	Greater than 10 volts on actuation.
5	31-LH45 (BK/WH) Switch illumination ground	0 voltage, less than 5 ohms to chassis ground.
6	64S-LH45 (BU/OG) Switch illumination power	Greater than 9 volts on actuation when connected.

Pinpoint Tests

Pinpoint Test A: No Communication With The Anti-lock Brake System (ABS) Module

Normal Operation

The operating voltage required to supply the ABS module, hydraulic pump, and isolation valves is in a range between 10 and 17 volts.

Voltage is supplied by circuit 30-CF6A (RD/YE) (ignition feed) and circuit 30-CF13 (RD) (power hot at all times). Ground is provided through circuit 31-CF6A (BK/YE) and 31-CF6B (BK).

Possible Causes

- charging system
- battery
- ground circuit 31-CF6A (BK/YE) or 31-CF6B (BK)
- power supply:
  - ♦ circuit 30-CF13 (RD) open
  - ♦ circuit 30-CF6A (RD/YE) open

PINPOINT TEST A: NO COMMUNICATION WITH THE ABS MODULE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
A1 CHECK THE VOLTAGE TO THE ABS MODULE	
• Key in OFF position. • Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the ABS module C155-1, circuit 30-CF13 (RD), harness side and ground; and between the ABS module C155-32, circuit 30-CF6 (RD/YE), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to A2 . **No** REPAIR the circuit in question. REPEAT the self-test.
A2 CHECK THE ABS MODULE GROUNDS	
• Key in OFF position. • Measure the resistance between the ABS module C155-16, circuit 31-CF6A (BK/YE), harness side and ground; and between the ABS module C155-47 circuit 31-CF6B (BK) harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** CHECK the module communications network. REFER to Section 418-00 . **No** REPAIR the circuit in question. REPEAT the self-test.

Pinpoint Test B: DTC B1483 Brake Pedal Input Circuit Failure

Normal Operation

The operating voltage required to supply the pedal travel switch (PTS) switch is 5 volts through circuit 7-CF65 (YE/VT).

The PTS signal is sent through circuit 8-CF65 (WH/VT) to the ABS module.

Ground is provided through circuit 9-CF65 (BN/WH).

Possible Causes

- power circuit 7-CF65 (YE/VT) open
- ground circuit 9-CF65 (BN/WH) short to voltage
- signal circuit 8-CF65 (WH/VT) open or short to voltage

PINPOINT TEST B: DTC B1483 BRAKE PEDAL INPUT CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
B1 CHECK CIRCUIT 7-CF65 (YE/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C155. • Measure the voltage between the ABS module C155-26, circuit 7-CF65 (YE/VT), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to B2 . **No** REPAIR the circuit in question 7-CF65 (YE/VT). CLEAR the DTC. REPEAT the self-test.
B2 CHECK CIRCUIT 8-CF65 (WH/VT)	
• Measure the voltage between the ABS module C155-40, circuit 8-CF65 (WH/VT), harness side and ground, while applying and releasing the brake pedal.  • **Is the voltage greater than 10 volts with the brake pedal applied, and 0 volts with the brake pedal released?**	**Yes** INSTALL a new pedal travel switch (PTS) switch. REFER to Section 417-01 . CLEAR the DTC. REPEAT the self-test. **No** GO to B3 .

B3 CHECK CIRCUIT 8-CF65 (WH/VT) FOR A SHORT TO GROUND	
• Measure the resistance between the ABS module C155-40, circuit 8-CF65 (WH/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit in question 8-CF65 (WH/VT). CLEAR the DTC. REPEAT the self-test.
B4 CHECK CIRCUIT 9-CF65 (BN/WH) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the ABS module C155-24, circuit 9-CF65 (BN/WH), harness side and ground.  • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new pedal travel switch (PTS) switch. REFER to Section 417-01 . CLEAR the DTC. REPEAT the self-test.

Pinpoint Test C: DTC B1676 Battery Pack Voltage Out Of Range

Normal Operation

The vehicle electrical system supplies 12 volts to the anti-lock brake system (ABS) module.

Voltage is supplied by circuit 30-CF6A (RD/YE) and circuit 30-CF13 (RD) (power hot at all times). Ground is provided through circuit 31-CF6A (BK/YE) and 31-CF6B (BK).

Possible Causes

- charging system
- battery
- ground circuit 31-CF6A (BK/YE) or 31-CF6B (BK)
- power supply:
  - ♦ circuit 30-CF13 (RD) open
  - ♦ circuit 30-CF6A (RD/YE) open

PINPOINT TEST C: DTC B1676 BATTERY PACK VOLTAGE OUT OF RANGE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take

C1 CHECK THE BATTERY VOLTAGE	
• Measure the battery voltage between the positive and negative battery posts with the key ON engine OFF (KOEO), and with the engine running. • **Is the battery voltage between 10 and 13 volts with KOEO, and between 11 and 17 volts with the engine running?**	**Yes** GO to C2 . **No** CHECK the charging system. REFER to Section 414-00 . TEST the system for normal operation.
C2 CHECK VOLTAGE TO THE ANTI-LOCK BRAKE SYSTEM (ABS) MODULE	
• Key in OFF position. • Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the ABS module C155-1, circuit 30-CF13 (RD), harness side and ground; and between the ABS module C155-32, circuit 30-CF6A (RD/YE), harness side and ground.  • **Are the voltages greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.
C3 CHECK THE ABS MODULE GROUNDS	
• Key in OFF position. • Measure the resistance between the ABS module C155-16, circuit 31-CF6A (BK/YE), harness side and ground; and between the ABS module C155-47 circuit 31-CF6B (BK) harness side and ground.  • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

Pinpoint Test D: DTC C1095 Anti-lock Brake system (ABS) Hydraulic Pump Motor Circuit Failure

Normal Operation

The operating voltage required to run the hydraulic pump motor is in a range between 10 and 17 volts.

Voltage is supplied by circuit 30-CF13 (RD) (power hot at all times). Ground is provided through circuit 31-CF6A (BK/YE) and 31-CF6B (BK/YE).

Possible Causes

- ground circuit 31-CF6A (BK/YE) or 31-CF6B (BK) open
- power supply circuit 30-CF13 (RD) open
- hydraulic pump motor
- ABS module

PINPOINT TEST D: DTC C1095 ABS HYDRAULIC PUMP MOTOR CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
D1 CHECK THE ABS PUMP MOTOR	
• Key in ON position. • **Is the ABS pump motor running all the time?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. **No** GO to D2 .
D2 CHECK THE PUMP MOTOR OPERATION	
• Key in ON position. • Trigger the ABS module pump motor ON active command. • **Does the ABS pump motor run for approximately 3 seconds?**	**Yes** CLEAR the DTC. CHECK the yellow ABS warning indicator while driving the vehicle (brakes must not be applied) above 32 km/h (20 mph). If the yellow ABS warning indicator illuminates, RETRIEVE the DTCs. If DTC C1095 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. If the yellow ABS warning indicator does not illuminate, the system is OK. **No** TRIGGER the ABS module pump motor OFF active command.GO to D3 .
D3 CHECK CIRCUIT 30-CF13 (RD) FOR AN OPEN	
• Disconnect: ABS Module C155. • Measure the voltage between the ABS module C155-1, circuit 30-CF13 (RD) harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to D4 . **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

D4 CHECK CIRCUIT 31-CF6A (BK/YE) OR 31-CF6B (BK) FOR AN OPEN	
• Measure the resistance between the ABS module C135-16, circuit 31-CF6A (BK/YE) harness side and ground; and between the ABS module C135-47, circuit 31-CF6B (BK) harness side and ground. Then, measure the resistance between ABS module C135-16 circuit 31-CF6A (BK/YE) and C135-47 circuit 31-CF6B (BK), component side.  • **Are the resistances less than 5 ohms?**	**Yes** INSTALL a new hydraulic control unit (HCU). REFER to Hydraulic Control Unit (HCU) in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

Pinpoint Test E: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR) Wheel Speed Sensor Input Circuit Failure

Normal Operation

The active wheel speed sensor generates a square wave signal that is sent to the anti-lock brake system (ABS) module. The wheel speed sensor circuitry connects to the ABS module connector C155 through 2 wires and a connector at each wheel speed sensor. When the ignition is turned to the RUN position, the ABS module carries out a self-test by sending a reference voltage through the right front wheel speed sensor and its circuitry to determine if they are functional.

12 volts are supplied to the active wheel speed sensors from the ABS module. The wheel speed sensor ground is supplied by the ABS module.

Possible Causes
- wheel speed sensor
- wheel speed sensor harness circuit (power or ground)
- ABS or wheel speed sensor connector(s)

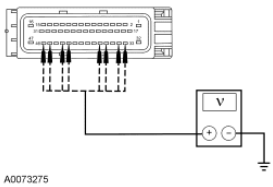
PINPOINT TEST E: DTC C1145 (RF), DTC C1155 (LF), DTC C1165 (RR), DTC C1175 (LR) WHEEL SPEED SENSOR INPUT CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
E1 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO VOLTAGE	

NOTE: Both circuits must be checked for each DTC.
- Key in OFF position.
- Disconnect: ABS Module C155.
- Disconnect: Suspect Wheel Speed Sensor.
- Key in ON position.
- Measure the voltage between ABS module C155 pins, harness side and ground, as follows:

DTC	ABS Module C155 Pin	Circuit
C1145 (RF)	33	8-CF38 (WH/RD)
C1145 (RF)	34	7-CF38 (YE/RD)
C1155 (LF)	45	7-CF32 (YE)
C1155 (LF)	46	8-CF32 (WH)
C1165 (RR)	42	8-CF40 (WH/GN)
C1165 (RR)	43	7-CF40 (YE/GN)
C1175 (LR)	36	7-CF34 (YE/BU)
C1175 (LR)	37	8-CF34 (WH/BU)



- **Is voltage present?**

Yes
REPAIR the circuit in question. CLEAR the DTC(s). REPEAT the self-test.

No
GO to E2 .

E2 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT TO GROUND

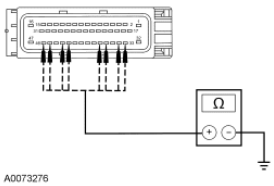
NOTE: Both circuits must be checked for each DTC.
- Key in OFF position.
- Measure the resistance between ABS module C155 pins harness side and ground, as follows:

DTC		Circuit

Yes
GO to E3 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

	ABS Module C155 Pin	
C1145 (RF)	33	8-CF38 (WH/RD)
C1145 (RF)	34	7-CF38 (YE/RD)
C1155 (LF)	45	7-CF32 (YE)
C1155 (LF)	46	8-CF32 (WH)
C1165 (RR)	42	8-CF40 (WH/GN)
C1165 (RR)	43	7-CF40 (YE/GN)
C1175 (LR)	36	7-CF34 (YE/BU)
C1175 (LR)	37	8-CF34 (WH/BU)



- **Are the resistances greater than 10,000 ohms?**

E3 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR AN OPEN

NOTE: Both circuits must be checked for each DTC.

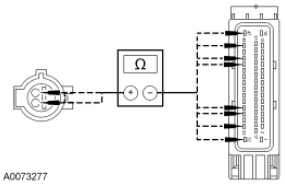
- Measure the resistance between ABS module C155 pins, harness side and the suspect wheel speed sensor connector pins, harness side as follows:

DTC	Circuit	ABS Module C155 Pin	Wheel Speed Sensor Connector Pin
C1145 (RF)	8-CF38 (WH/RD)	33	2
C1145 (RF)	7-CF38 (YE/RD)	34	1
C1155 (LF)	7-CF32 (YE)	45	1
C1155 (LF)	8-CF32 (WH)	46	2

Yes
GO to E4 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

C1165 (RR)	7-CF40 (YE/GN)	43	1
C1165 (RR)	8-CF40 (WH/GN)	42	2
C1175 (LR)	8-CF34 (WH/BU)	37	1
C1175 (LR)	7-CF34 (YE/BU)	36	2



- **Are the resistances less than 5 ohms?**

E4 CHECK THE WHEEL SPEED SENSOR CIRCUITS FOR A SHORT	
• Measure the resistance between the suspect wheel speed sensor pins.  • **Is the resistance greater 10,000 ohms?**	**Yes** GO to E5 . **No** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.
E5 CHECK THE ABS MODULE OUTPUT	
• Connect: ABS Module C155. • Key in ON position. • Measure the voltage between the suspect wheel speed sensor pins, harness side.  • **Is the voltage less than 9 volts?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor Front in this section. CLEAR the DTC. REPEAT the self-test. For the rear wheel speed sensor, REFER to Wheel Speed Sensor Rear in this section. CLEAR the DTC. REPEAT the self-test.

Pinpoint Test F: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) Wheel Speed Sensor Input Signal Missing

Normal Operation

The wheel speed sensor and sensor ring generate a square wave signal to the anti-lock brake system (ABS) module that is proportional to wheel speed. The ABS module compares wheel speed inputs from all wheel speed sensors to determine an impending wheel lockup.

Possible Causes

- mismatched tire sizes
- wheel speed sensor ring
- wheel speed sensor
- ABS module

PINPOINT TEST F: DTC C1233 (LF), DTC C1234 (RF), DTC C1235 (RR), DTC C1236 (LR) WHEEL SPEED SENSOR INPUT SIGNAL MISSING

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
F1 CHECK FOR DTCs	
• Key in ON position. • Connect the diagnostic tool. • **Is DTC C1145, C1155, C1165 or C1175 present?**	**Yes** Go To Pinpoint Test E . **No** GO to F2 .
F2 CHECK THE WHEEL SPEED PIDs	
• Use the diagnostic tool to monitor the wheel speed PIDs while driving the vehicle at a constant speed. • **Are the 4 wheel speed PID values similar?**	**Yes** CLEAR the DTC. DRIVE the vehicle. RETRIEVE DTCs. If DTC C1233, C1234, C1235 or C1236 is present, INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test. **No** GO to F3 .
F3 CHECK THE WHEEL SPEED SENSOR FOR DAMAGE AND/OR LOOSENESS	
• Key in OFF position. • With the vehicle in NEUTRAL, position the vehicle on a hoist. For additional information, refer to Section 100-02 . • **⚠ CAUTION: Examine the wheel speed sensor wire carefully with a good light. Failure to verify damage in the wheel speed sensor wire can lead to unnecessary installation of a new component.** • Inspect the wheel speed sensor mounting for looseness. If the wheel speed sensor is suspected, inspect the sensor for corrosion or on the front	**Yes** GO to F4 . **No** INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor Front in this section. CLEAR the DTC. REPEAT the self-test. For the rear wheel speed sensor, REFER to Wheel Speed Sensor Rear in this section. CLEAR the DTC. REPEAT the self-test.

anti-lock brake mounting flange. Clean as necessary. • **Is the wheel speed sensor OK?**	
F4 CHECK FOR WHEEL SPEED SENSOR RING DAMAGE	
• Remove the wheel speed sensor. • Inspect the wheel speed sensor ring for damaged or missing teeth. Rotate the wheel to verify that no teeth are missing. • **Is the wheel speed sensor ring OK?**	**Yes** GO to F5 . **No** INSTALL a new wheel speed sensor ring. For the front wheel speed sensor ring, REFER to Section 204-01 . CLEAR the DTC. REPEAT the self-test. For the rear wheel speed sensor ring, REFER to Section 205-05 . CLEAR the DTC. REPEAT the self-test.
F5 CHECK THE ANTI-LOCK BRAKE CONTROL MODULE OUTPUT	
• Key in ON position. • Measure the voltage between the ABS module C155 pins and the suspect wheel speed sensor connector pins as follows:	**Yes** INSTALL a new wheel speed sensor. For the front wheel speed sensor, REFER to Wheel Speed Sensor Front in this section. CLEAR the DTC. REPEAT the self-test. For the rear wheel speed sensor, REFER to Wheel Speed Sensor Rear in this section. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new anti-lock brake control module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation.

DTC	Circuit	ABS Module C155 Pin	Wheel Speed Sensor Connector Pin
C1234 (RF)	8-CF38 (WH/RD)	33	2
C1234 (RF)	7-CF38 (YE/RD)	34	1
C1233 (LF)	7-CF32 (YE)	45	1
C1233 (LF)	8-CF32 (WH)	46	2
C1235 (RR)	7-CF40 (YE/GN)	43	1
C1235 (RR)	8-CF40 (WH/GN)	42	2
C1236 (LR)	8-CF34 (WH/BU)	37	1
C1236 (LR)	7-CF34 (YE/BU)	36	2

 • **Are the voltages greater than 9 volts?**	

Pinpoint Test G: DTC C1277/C1278 Steering Wheel Angle 1 and 2 Circuit Failure/Faulted

Normal Operation

The steering wheel rotation sensor monitors the steering wheel position when the toothed-wheel on the steering shaft passes through its magnetic field.

Steering wheel rotation (in degrees) is sent to the anti-lock brake system (ABS) module through circuit 8-CC18 (WH/RD) and circuit 10-CC17 (GY). Voltage is supplied by the ABS module through circuit 7-CC1 (YE/RD). Ground is provided by the ABS module through circuit 9-CC1 (BN/RD).

Possible Causes

- sensor signal circuit 8-CC18 (WH/RD) open, short to ground, or short to voltage
- sensor signal circuit 10-CC17 (GY) open, short to ground, or short to voltage
- sensor power circuit 7-CC1 (YE/RD) open, short to ground, or short to voltage
- sensor ground circuit 9-CC1 (BN/RD) open, short to ground, or short to voltage
- steering wheel rotation sensor

PINPOINT TEST G: DTC C1277/C1278 STEERING WHEEL ANGLE 1 AND 2 CIRCUIT FAILURE/FAULTED

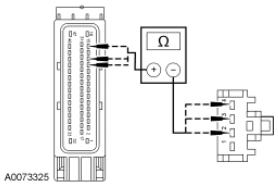
⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
G1 CARRY OUT THE RECALIBRATION PROCEDURE FOR THE STEERING WHEEL ROTATION SENSOR	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear the DTC. • Carry out the steering wheel rotation sensor recalibration procedure using the diagnostic tool. • Follow the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any DTCs retrieved or does the recalibration procedure**	**Yes** If DTC C1277 or C1278 is retrieved or the recalibration procedure indicates a fault, GO to G2 . If any other DTC, GO to the ABS (With or Without Advance Trac®/IVD) Module Diagnostic Trouble Code (DTC) Index. **No** The ABS system is operating correctly. The diagnostic trouble code (DTC) C1278 was meant for detection of steering wheel rotation sensor harness wiring problems at vehicle assembly time. The steering wheel rotation sensor circuit is checked for swapped wires (channel A and B). This DTC should not occur during

indicate a fault?	repair unless the harness wiring to the steering wheel rotation sensor was changed or the PRNDL position indicator is not operating correctly. The DTC will occur only after driving a few feet and making a turn if the wiring problem or PRNDL problem exists.
G2 MONITOR THE STEERING ROTATION SENSOR PIDs	
• Key in ON position. • Monitor the steering rotation sensor PIDs while rotating the steering wheel clockwise and counterclockwise. • **Are the 2 PID values similar?**	**Yes** CLEAR the DTC. DRIVE the vehicle. RETRIEVE the DTCs. If DTC C1277 is present, INSTALL a new ABS control module. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test. **No** GO to G3 .
G3 CHECK THE VOLTAGE TO THE STEERING WHEEL ROTATION SENSOR	
• Key in OFF position. • Disconnect: Steering Wheel Rotation Sensor C226. • Key in ON position. • Measure the voltage between the steering wheel rotation sensor C226-1, circuit 7-CC16A (YE/BK), harness side and ground.  A0057752 • **Is the voltage greater than 5 volts?**	**Yes** GO to G4 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
G4 CHECK THE STEERING WHEEL ROTATION SENSOR CIRCUITRY FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS module C155. • Measure the resistance between the ABS module C155 pins, harness side and steering wheel rotation sensor C226 pins, harness side as follows:	**Yes** GO to G5 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.

	Circuit		Circuit

Steering Wheel Rotation Sensor C226 Pin		ABS Module C155 Pin	
2	10-CC17 (GY)	6	10-CC17 (GY)
3	8-CC18 (WH/RD)	3	8-CC18 (WH/RD)
4	9-CC1 (BN/YE)	5	9-CC1 (BN/RD)

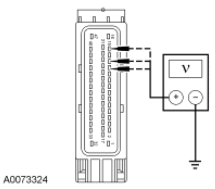


- **Are the resistances less than 5 ohms?**

G5 CHECK THE STEERING WHEEL ROTATION SENSOR FOR A SHORT TO VOLTAGE

- Key in OFF position.
- Connect: Steering Wheel Rotation Sensor C226.
- Disconnect: ABS Module C155.
- Key in ON position.
- Measure the voltage between the ABS module C155 pins, harness side and ground as follows:

ABS Module C155 Pin	Circuit
6	10-CC17 (GY)
3	8-CC18 (WH/RD)
5	9-CC1 (BN/RD)



- **Is any voltage present?**

Yes
REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.

No
GO to G6 .

G6 CHECK THE STEERING WHEEL ROTATION SENSOR CIRCUITRY FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the ABS module C155 pins, harness side and ground as follows: **ABS Module C155 Pin** / **Circuit** 6 — 10-CC17 (GY) 3 — 8-CC18 (WH/RD) 5 — 9-CC1 (BN/RD)  • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new steering rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTC. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.

Pinpoint Test H: DTC C1279, C1280, C1281, C1282, C2769, C2770 Sensor Cluster Fault

Normal Operation

The accelerometer (lateral and longitudinal) and the yaw rate sensor are contained in the sensor cluster. The sensor measures the vehicle acceleration and yaw rate then sends the signal via CAN communication wires to the anti-lock brake system (ABS) module.

Voltage is supplied by circuit 7-CC1 (YE/RD). Ground is provided through circuit 9-CF67 (BN/RD). The controller area network (CAN) communication is transmitted through circuit 5-CF66 (BU/WH) and circuit 4-CF66 (GY/VT).

Possible Causes

- power circuit 7-CC1 (YE/RD) open, short to ground, or short to power
- ground circuit 9-CF67 (BN/RD) open, short to ground, or short to power
- CAN communication:
  - ♦ circuit 5-CF66 (BU/WH) open, short to ground, or short to power
  - ♦ circuit 4-CF66 (GY/VT) open, short to ground, or short to power

PINPOINT TEST H: DTC C1279, C1280, C1281, C1282, C2769, C2770 SENSOR CLUSTER FAULT

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

NOTE: The yaw rate sensor and accelerometer are integral to the sensor cluster.

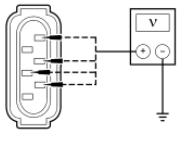
The sensor cluster is not serviceable and must be installed as an assembly.

Test Step	Result / Action to Take
H1 CARRY OUT THE YAW RATE SENSOR RECALIBRATION PROCEDURE	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear DTCs. • Carry out the yaw rate sensor recalibration procedure using the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any DTCs retrieved or does the recalibration procedure indicate a fault?**	**Yes** GO to H2 . **No** The ABS system is operating correctly.
H2 CHECK THE ABS MODULE YAW RATE PID	
• Monitor the ABS module yaw rate PID. • **Is the ABS module yaw rate PID value between 479 and 545?**	**Yes** INSTALL a new yaw rate sensor. REFER to Yaw Rate Sensor in this section. CLEAR the DTCs. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test. **No** GO to H3 .
H3 REVERIFY THE ABS MODULE YAW RATE PID	
• Monitor the ABS module yaw rate PID. • **Is the ABS module yaw rate PID value between 479 and 545?**	**Yes** CHECK the ABS module connector for loose or corroded pins. CLEAR the DTC. REPEAT the self-test. **No** GO to H4 .
H4 CHECK THE VOLTAGE FROM THE ABS MODULE	
• Key in OFF position. • Disconnect: The Yaw rate sensor C3073. • Key in ON position. • Measure the voltage between the yaw	**Yes** INSTALL a new sensor cluster. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test.

rate sensor C3073-1, circuit 5-CF67 (BU/WH), harness side and the yaw rate sensor C3073-5, circuit 9-CF67 (BN/RD), harness side.  A0057757 • **Is the voltage approximately 10 volts?**	**No** GO to H5 .
H5 CHECK THE YAW RATE SENSOR CIRCUITRY FOR AN OPEN	
• Measure the resistance between the ABS module C155 pins, harness side and yaw rate sensor C3073 pins, harness side as follows: **ABS Module C155 Pin** / **Yaw Rate Sensor C3073 Pin** / **Circuit** 7 / 3 / 7-CF67 (YE/RD) 5 / 5 / 9-CC1 (BN/RD)/9-CF67 (BN/RD) 25 / 1 / 5-CF66 (BU/WH) 29 / 2 / 4-CF66 (GY/VT)  A0073322 • **Is the resistance less than 5 ohms?**	**Yes** GO to H6 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
H6 CHECK THE YAW RATE SENSOR CIRCUITRY FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Disconnect: Yaw Rate Sensor C3073. • Key in ON position. • Measure the voltage between yaw rate sensor C3073 pins, harness side and	**Yes** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.

ground as follows:

Yaw Rate Sensor C3073 Pin	Circuit
3	7-CF67 (YE/RD)
5	9-CF67 (BN/RD)
1	5-CF66 (BU/WH)
2	4-CF66 (GY/VT)



A0057759

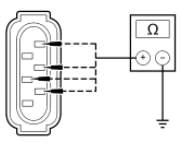
- **Is voltage present?**

No
GO to H7 .

H7 CHECK THE YAW RATE SENSOR CIRCUITRY FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the yaw rate sensor C3073 pins, harness side and ground as follows:

Yaw Rate Sensor C3073 Pin	Circuit
3	7-CF67 (YE/RD)
5	9-CF67 (BN/RD)
1	5-CF66 (BU/WH)
2	4-CF66 (GY/VT)



A0057760

Yes
INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. REPEAT the self-test.

No
REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.

• **Is the resistance greater than 10,000 ohms?**	

Pinpoint Test I: DTC C1285 Booster Solenoid Circuit Failure

Normal Operation

The active brake booster has internal solenoids that assist driver brake applications or can apply the brakes when needed if the vehicle loses control.

Power is supplied by circuit 8-CF68 (WH/RD). Ground is provided through circuit 9-CF68 (BN/RD).

Possible Causes
- power circuit 8-CF68 (WH/RD) open
- ground circuit 9-CF68 (BN/RD) open
- active brake booster
- ABS module

PINPOINT TEST I: DTC C1285 BOOSTER SOLENOID CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
I1 CARRY OUT THE BRAKE BOOSTER RECALIBRATION PROCEDURE	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear DTC. • Carry out the brake booster recalibration procedure using the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any diagnostic trouble codes (DTCs) retrieved or does the recalibration procedure indicate a fault?**	**Yes** If DTC C1285 is retrieved, or the brake booster portion of the recalibration procedure indicates a failure, GO to I2 . If any other DTC is retrieved, GO to the Anti-lock Brake System (ABS) (With or Without Advance Trac®/IVD) Module Diagnostic Trouble Code (DTC) Index. **No** The ABS system is operating correctly.
I2 CHECK THE BRAKE BOOSTER SOLENOID	
• Key in OFF position. • Disconnect: Brake Booster C149. • Measure the resistance between brake booster solenoid C149-3, component side and brake booster solenoid C149-4, component side.	**Yes** GO to I3 . **No** INSTALL a new brake booster. REFER to Section 206-07 . CLEAR the DTC. RECALIBRATE the ABS

 A0057761 • **Is the resistance between 1 and 2 ohms?**	module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
I3 CHECK CIRCUIT 8-CF68 (WH/RD) AND CIRCUIT 9-CF68 (BN/RD) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between the ABS module C155-17, circuit 8-CF68 (WH/RD), harness side and the brake booster C149-4, circuit 8-CF68 (WH/RD), harness side; and between the ABS module C155-31, circuit 9-CF68 (BN/RD), harness side and the brake booster C149-3, circuit 9-CF68 (BN/RD), harness side.  N0002989 • **Is the resistance less than 5 ohms?**	**Yes** GO to I4 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
I4 CHECK CIRCUIT 8-CF68 (WH/RD) FOR A SHORT TO GROUND	
• Measure the resistance between the brake booster C149-4, circuit 8-CF68 (WH/RD), harness side and ground.  A0057763 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to I5 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
I5 CHECK CIRCUIT 9-CF68 (BN/RD) FOR A SHORT TO VOLTAGE	
• Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the brake booster solenoid C149-3, circuit 9-CF68 (BN/RD), harness side and ground.  A0057773 • **Is voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test. **No** GO to I6 .

I6 CHECK THE BRAKE BOOSTER SOLENOID FOR CORRECT OPERATION	
• Connect: Brake Booster C149. • Key in START position. • Wait a few minutes to create engine vacuum in the brake booster and then place the ignition switch in the OFF position. • Connect a fused (10A) jumper wire between ABS module C155-31, circuit 9-CF68 (BN/RD), harness side and ground; and connect a fused (10A) jumper wire for several seconds between ABS module C155-17, circuit 8-CF68 (WH/RD), harness side and the positive battery post, while observing the brake pedal for movement. • **Does the brake pedal move?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test. **No** INSTALL a new brake booster. REFER to Section 206-07 . CLEAR the DTC. RECALIBRATE the ABS module. REPEAT the self-test.

Pinpoint Test J: DTC C1287 Brake Booster Pedal Force Switch Circuit Failure

Normal Operation

The active brake booster has a normally open (NO), and a normally closed, (NC) pedal force switch that operates according to driver brake applications.

The NO pedal force switch circuit is 8-CF51 (WH/GN). The NC pedal force switch circuit is 10-CF51 (GY/OG).

Possible Causes

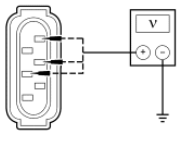
- no pedal force switch circuit 8-CF51 (WH/GN) open, short to ground, or short to voltage
- no pedal force switch circuit 10-CF51 (GY/OG) open, short to ground, or short to voltage
- active brake booster
- anti-lock brake system (ABS) module

PINPOINT TEST J: DTC C1287 BRAKE BOOSTER PEDAL FORCE SWITCH CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
J1 CARRY OUT THE BRAKE BOOSTER RECALIBRATION PROCEDURE	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear DTCs. • Carry out the brake booster recalibration procedure using the diagnostic tool. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Are any DTCs retrieved or does the recalibration procedure indicate a fault?**	**Yes** If DTC C1287 is retrieved or the recalibration procedure indicates a fault, GO to J2 . If any other DTC, GO to the ABS (With or Without Advance Trac®/IVD) Module Diagnostic Trouble Code (DTC) Index. **No** The system is operating correctly.

J2 CHECK THE NORMALLY CLOSED RELEASE SWITCH	
• Key in OFF position. • Disconnect: Brake Booster C149. • Measure the resistance between the brake booster C149-2, component side and the brake booster C149-5, component side, while applying and releasing the brake pedal.  A0057772 • **Is the resistance less than 5 ohms with the brake pedal released and greater than 10,000 ohms with the brake pedal applied?**	**Yes** GO to J3 . **No** INSTALL a new brake booster. REFER to Section 206-07 . CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
J3 CHECK THE NORMALLY OPEN RELEASE SWITCH	
• Measure the resistance between the brake booster C149-1, component side and the brake booster C149-5, component side, while applying and releasing the brake pedal.  A0057375 • **Is the resistance less than 5 ohms with the brake pedal applied and greater than 10,000 ohms with the brake pedal released?**	**Yes** GO to J4 . **No** INSTALL a new brake booster. REFER to Section 206-07 . CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
J4 CHECK THE BRAKE BOOSTER CIRCUITRY FOR A SHORT TO VOLTAGE	
• Disconnect ABS Module C155 • Key in ON position. • Measure the voltage between the brake booster C149 pins, harness side and ground, as follows: **Active Brake Booster C149** / **Circuit** 1 / 8-CF51 (WH/GN) 2 / 10-CF51 (GY/OG) 5 / 9-CF51 (BN/RD)	**Yes** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. REPEAT the self-test. **No** GO to J5 .

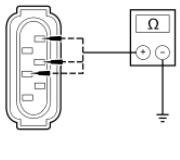


- **Is voltage present?**

J5 CHECK THE BRAKE BOOSTER CIRCUITRY FOR A SHORT TO GROUND

- Measure the resistance between the brake booster C149 pins and ground as follows:

Brake Booster Pin	Circuit
1	8-CF51 (WH/GN)
2	10-CF51 (GY/OG)
5	9-CF51 (BN/GN)



- **Is the resistance greater than 10,000 ohms?**

Yes
GO to J6 .

No
REPAIR the circuit in question. CLEAR the DTC(s). REPEAT the self-test.

J6 CHECK THE BRAKE BOOSTER CIRCUITRY FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the ABS module C155 pins, harness side and the brake booster C149 pins, harness side as follows:

ABS Module C155 Pin	Brake Booster C149 Pin	Circuit
27	1	8-CF51 (WH/GN)
28	5	9-CF51 (BN/GN)
30	2	10-CF51 (GY/OG)

Yes
INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test.

No
REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-00 . REPEAT the self-test.

 • **Are the resistances less than 5 ohms?**	

Pinpoint Test K: DTC C1288 Brake Pressure Transducer Input Circuit Failure

Normal Operation

The brake pressure transducer sends current to the anti-lock brake system (ABS) module proportional to the driver's brake pedal application.

Reference voltage is supplied by circuit 7-CF64 (YE/BK). Ground is provided through circuit 9-CF64 (BN/YE). The transducer current is supplied by circuit 8-CF64 (WH/BK).

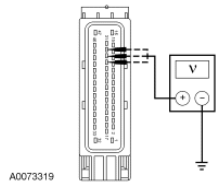
Possible Causes

- reference voltage circuit 7-CF64 (YE/BK) open, short to ground, or short to voltage
- ground circuit 9-CF64 (BN/YE) open, short to ground, or short to voltage
- transducer signal circuit 8-CF64 (WH/BK) open, short to ground, or short to voltage
- brake pressure transducer
- ABS module

PINPOINT TEST K: DTC C1288 BRAKE PRESSURE TRANSDUCER INPUT CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
K1 CHECK THE BRAKE PRESSURE TRANSDUCER CIRCUITRY FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Disconnect: Brake Pressure Transducer C147. • Key in ON position. • Measure the voltage between the ABS module C155 pins, harness side and ground as follows: **ABS Module C155 Pin** / **Circuit** 18 / 7-CF64 (YE/BK) 19 / 9-CF64 (BN/YE) 20 / 8-CF64 (WH/BK)	**Yes** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test. **No** GO to K2 .

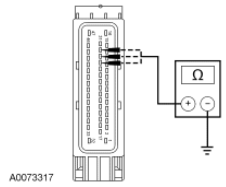


- **Is voltage present?**

K2 CHECK THE BRAKE PRESSURE TRANSDUCER CIRCUITRY FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between the ABS module C155 pins, harness side and ground, as follows:

ABS Module C155 Pin	Circuit
18	7-CF64 (YE/BK)
19	9-CF64 (BN/YE)
20	8-CF64 (WH/BK)



- **Are the resistances greater than 10,000 ohms?**

Yes
GO to K3 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

K3 CHECK THE BRAKE PRESSURE TRANSDUCER CIRCUITRY FOR AN OPEN

- Measure the resistance between the ABS module C155 pins, harness side and the brake pressure transducer C147 pins, harness side as follows:

ABS Module C155 Pin	Brake Pressure Transducer C147 Pin	Circuit
19	1	9-CF64 (BN/YE)
20	2	8-CF64 (WH/BK)
18	3	7-CF64 (YE/BK)

Yes
GO to K4 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

 A0073318 • **Are the resistances less than 5 ohms?**	
K4 CHECK THE ABS MODULE OUTPUT	
• Connect: ABS Module C155. • Key in ON position. • Measure the voltage between the brake pressure transducer C147-3, circuit 7-CF64 (YE/BK), harness side and the brake pressure transducer C147-1, circuit 9-CF64 (BN/YE), harness side.  A0057777 • **Is the voltage approximately 5 volts?**	**Yes** GO to K5 . **No** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test.
K5 CHECK THE BRAKE PRESSURE TRANSDUCER OUTPUT	
• Connect: Brake Pressure Transducer C147. • Disconnect: ABS Module C155. • Remove the ABS module C155-20, circuit 8-CF64 (WH/BK) from the harness connector. • Connect: ABS Module C155. • Key in ON position. • Measure the voltage between the ABS module with C155-20, with circuit 8-CF64 (WH/BK) removed from the harness connector and ground, while applying and releasing the brake pedal. • **Is the voltage between 0.125 and 0.375 volt with the brake pedal released and between 0.125 and 5 volts with the brake pedal applied?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test. **No** INSTALL a new brake booster. REFER to Section 206-07 . CLEAR the DTC. RECALIBRATE the ABS module. REPEAT the self-test.

Pinpoint Test L: DTC C1730 Reference Voltage Out Of Range (+5 V)

Normal Operation

The 5-volt reference voltage is supplied by the anti-lock brake system (ABS) module.

Reference voltage is supplied by circuit 7-CF64 (YE/BK). The reference voltage circuit returns to the ABS module through the PTS switch circuit 9-CF65 (BN/WH) and the brake pressure transducer circuit 9-CF64 (BN/YE).

Possible Causes

- circuit 7-CF64 (YE/BK) short to ground or short to voltage
- ground circuit 9-CF65 (BN/WH) short to ground or short to voltage

- ground circuit 9-CF64 (BN/YE) short to ground or short to voltage
- signal return (+) circuit 7-CC1 (YE/RD) short to ground or short to voltage
- circuit 8-CF68 (WH/RD) short to ground
- ABS module
- IVD input/output components:
    - ♦ pedal travel switch (PTS) switch
    - ♦ brake pressure transducer

PINPOINT TEST L: DTC C1730 REFERENCE VOLTAGE OUT OF RANGE (+5 V)

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
L1 CHECK CIRCUIT 7-CF64 (YE/BK) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Disconnect: Brake Pressure Transducer C147. • Key in ON position. • Measure the voltage between the ABS module C155-18, circuit 7-CF64 (YE/BK), harness side and ground.  • **Is voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test. **No** GO to L2 .
L2 CHECK CIRCUIT 7-CF64 (YE/BK) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the ABS module C155-18, circuit 7-CF64 (YE/BK), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L3 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
L3 CHECK CIRCUIT 8-CF68 (WH/RD) FOR A SHORT TO GROUND	

• Key in OFF position. • Measure the resistance between the ABS module C155-17, circuit 8-CF68 (WH/RD), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L4 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
L4 CHECK CIRCUIT 7-CC1 (YE/RD) FOR A SHORT TO BATTERY	
• Disconnect: Yaw Rate Sensor C3073. • Key in ON position. • Measure the voltage between the ABS module C155-7, circuit 7-CC1 (YE/RD), harness side and ground.  • **Is voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test. **No** GO to L5 .
L5 CHECK CIRCUIT 7-CC1 (YE/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the ABS module C155-7, circuit 7-CC1 (YE/RD), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to L6 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test.
L6 CHECK THE ABS MODULE	
• Connect: ABS Module C155. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear DTCs. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Is DTC C1730 retrieved?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test. **No** GO to L7 .

L7 CHECK THE ADVANCE TRAC®/(IVD) COMPONENTS	
• Reconnect the brake pressure transducer C147, and the PTS C278, while clearing the DTCs and retrieving the DTCs in between each component being reconnected. • **Is DTC C1730 retrieved?**	**Yes** INSTALL a new brake booster. REFER to Section 206-07 . CLEAR the DTC. RECALIBRATE the ABS module. FOLLOW the diagnostic tool directions for the calibration procedure. REFER to Section 418-01 . REPEAT the self-test. **No** System is OK. REPEAT the self-test.

Pinpoint Test M: DTC C1960 Driver Brake Apply Circuit Fault

Normal Operation

The 12-volt driver brake apply (DBA) signal is sent from the anti-lock brake system (ABS) module during brake application to the trailer tow relay (if equipped).

Voltage is supplied by circuit 29S-CF2 (OG/BU).

Possible Causes
- DBA signal circuit 29S-CF2 (OG/BU)
- ABS module

PINPOINT TEST M: DTC C1960 DRIVER BRAKE APPLY CIRCUIT FAULT

⚠ **CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.**

Test Step	Result / Action to Take
M1 CHECK FOR OTHER DTCs	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Clear DTCs. • Enter the following diagnostic mode on the diagnostic tool: Retrieve DTCs. • **Is DTC C1960 retrieved?**	**Yes** GO to M2 . **No** If a different DTC is retrieved, GO to the ABS (With or Without Advance Trac®/IVD) Module Diagnostic Trouble Code (DTC) Index. If no DTCs are retrieved, system is OK.
M2 CHECK CIRCUIT 29S-CF2 (OG/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Measure the voltage between the ABS module C155-44, circuit 29S-CF2 (OG/BU), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new ABS module. REFER to

 • **Is the voltage greater than 0 volts?**	Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test.

Pinpoint Test N: The Advance Trac®/IVD Is Inoperative

Normal Operation

Engine torque modulation is achieved by regulating fuel and spark to the cylinders. The Advance Trac®/IVD system operates using the anti-lock brake system (ABS) module to interact with the powertrain control module (PCM) to reduce engine torque if one or both rear wheels lose traction and begin to spin during acceleration.

Voltage is supplied by circuit 20-CF54 (PK/WH).

Possible Causes
- Advance Trac®/IVD switch
- power circuit 20-CF54 (PK/WH) open
- power circuit 8-CF54 (WH/VT) open
- ABS module

PINPOINT TEST N: THE ADVANCE TRAC®/IVD IS INOPERATIVE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
N1 CHECK FOR DTCs	
• Connect the diagnostic tool. • Retrieve and document continuous DTCs. • **Are any DTCs retrieved?**	**Yes** GO to the ABS (With or Without Advance Trac®/IVD) Module Diagnostic Trouble Code (DTC) Index. **No** GO to N2 .
N2 CHECK THE Advance Trac®/IVD SWITCH	
• Disconnect: Advance Trac®/IVD Switch C3208. • Key in OFF position. • Press the Advance Trac®/IVD switch to the ON position. • Measure the resistance between the Advance Trac®/IVD switch C3208-3, circuit 20-CF54 (PK/WH), component side and C3208-4, circuit 8-CF54 (WH/VT), component side.	**Yes** GO to N3 . **No** INSTALL a new Advance Trac®/IVD switch. TEST the system for normal operation.GO to N3 .

 N0002990 • **Is the resistance less than 5 ohms?**	
N3 CHECK CIRCUIT 8-CF54 (WH/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: ABS Module C155 . • Measure the resistance between the ABS module C155-38, circuit 8-CF54 (WH/VT), harness side and the Advance Trac®/IVD switch connector C3208-4, circuit 8-CF54 (WH/VT), harness side.  N0002991 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. **No** REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test O: Advance Trac®/IVD Switch Indicator Is Always On/Cannot Be Disabled

Normal Operation

The traction control switch is a momentary switch, and when pressed disables or enables the traction control or Advance Trac®/IVD.

Voltage to the traction control switch is supplied by circuit 8-CF54 (WH/VT). The switch illumination off circuit is 31S-CF45 (BK/GN).

Possible Causes

- advance Trac®/IVD switch
- power circuit 8-CF54 (WH/VT) short to voltage
- illumination circuit 31S-CF45 (BK/GN) short to ground
- anti-lock brake system (ABS) module

PINPOINT TEST O: ADVANCE TRAC®/IVD CANNOT BE DISABLED/SWITCH INDICATOR IS ALWAYS ON

Test Step	Result / Action to Take
O1 CHECK THE Advance Trac®/IVD SWITCH	
• Disconnect: Advance Trac®/IVD Switch C3208. • Key in OFF position. • Measure the resistance between the Advance Trac®/IVD switch C3208-1, circuit 31S-CF45 (BK/GN), component side and the Advance Trac®/IVD switch C3208-4, circuit	**Yes** GO to O2 . **No** INSTALL a new Advance Trac®/IVD switch. TEST the system

8-CF54 (WH/VT), component side.  N0002992 • **Is the resistance greater than 10,000 ohms?**	for normal operation.
O2 CHECK CIRCUIT 8-CF54 (WH/VT) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the ABS module C155-38, circuit 8-CF54 (WH/VT), harness side and ground.  A0073310 • **Is voltage present?**	**Yes** REPAIR the circuit. REPEAT the self-test. **No** GO to O3 .
O3 CHECK CIRCUIT 31S-CF45 (BK/GN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the ABS module C155-13, circuit 31S-CF45 (BK/GN), harness side and ground.  A0073309 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. REPEAT the self-test. **No** REPAIR the circuit in question. REPEAT the self-test.

Pinpoint Test P: DTC C1440 Pressure Transducer Input Circuit Failure

Normal Operation

The pressure transducer transforms brake fluid pressures in the master cylinder to an electrical signal which the anti-lock brake system (ABS) module receives through circuit 8-CF64 (WH/BK). The transducer receives a 5-volt reference from the ABS module through circuit 7-CF64 (YE/BK). Circuit 9-CF64 (BN/YE) provides ground for the transducer.

Possible Causes

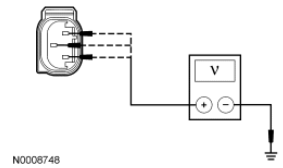
- power circuit 7-CF64 (YE/BK) open, short to ground, or short to voltage

- ground circuit 9-CF64 (BN/YE) open, short to ground, or short to voltage
- transducer signal circuit 8-CF64 (WH/BK) short to ground or short to voltage
- pressure transducer
- ABS module

PINPOINT TEST P: DTC C1440 PRESSURE TRANSDUCER INPUT CIRCUIT FAILURE

NOTE: Excessive clearance between brake pad and rotor, leaks, or air in the hydraulic brake system can also set DTC C1440.

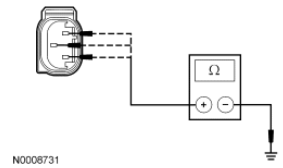
Test Step	Result / Action to Take
P1 CHECK FOR DTCs	
• Key in ON position. • Connect the diagnostic tool. • Retrieve the DTCs. • **Is DTC C1483, C1287, B2734, B2736, B2737, B2738 or B2740 present?**	**Yes** SERVICE these DTCs first. GO to the appropriate pinpoint test for each DTC received. **No** GO to P2 .
P2 CHECK FOR 5 VOLT REFERENCE VOLTAGE TO THE PRESSURE TRANSDUCER	
• Key in OFF position. • Disconnect: Pressure Transducer C147. • Key in ON position. • Measure the voltage between the pressure transducer C147-1, circuit 9-CF64 (BN/YE), harness side and the pressure transducer C147-3, circuit 7-CF64 (YE/BK), harness side.  N0008730 • **Is the voltage approximately 5 volts?**	**Yes** GO to P6 . **No** GO to P3 .
P3 CHECK CIRCUITS FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the pressure transducer C147-3, circuit 7-CF64 (YE/BK), harness side and ground; and between the pressure transducer C147-1, circuit 9-CF64 (BN/YE), harness side and ground; and between the pressure transducer C147-2, circuit 8-CF64 (WH/BK), harness side and ground.	**Yes** REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test. **No** GO to P4 .



- **Is any voltage present?**

P4 CHECK CIRCUITS FOR A SHORT TO GROUND

- Key in OFF position.
- Measure the resistance between pressure transdducer C147-3, circuit 7-CF64 (YE/BK), harness side and ground; between the pressure transducer C147-1, circuit 9-CF64 (BN/YE), harness side and ground; and between the pressure transducer C147-2, circuit 8-CF64 (WH/BK), harness side and ground.



- **Is the resistance greater than 10,000 ohms?**

Yes
GO to P5 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

P5 CHECK CIRCUIT RESISTANCE

- Measure the resistance between the ABS module C155 and the pressure transducer C147 pins.

ABS Module C155	Pressure Transducer C147	Circuit
Pin 18	Pin 3	7-CF64 (YE/BK)
Pin 20	Pin 2	8-CF64 (WH/BK)
Pin 19	Pin 1	9-CF64 (BN/YE)

- **Is the resistance less than 5 ohms?**

Yes
GO to P6 .

No
REPAIR the circuit in question. CLEAR the DTC. REPEAT the self-test.

P6 CHECK THE SIGNAL FROM THE PRESSURE TRANSDUCER

- Connect: Pressure Transducer C147.
- Disconnect: ABS Module C155-20, circuit 8-CF64 (WH/BK).
- Connect: ABS Module C155.
- Key in ON position.
- Measure the voltage between the ABS C155-20, circuit 8-CF64 (WH/BK), harness side and ground while applying and releasing the brake pedal.

Yes
INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section.

No
INSTALL a new pressure transducer. CLEAR the DTC. REPEAT the self-test.

 • **Is any voltage present?**	

Pinpoint Test Q: DTC C1969 Traction Control/Yaw Rate Control Switch Circuit

Normal Operation

The traction control switch is a momentary switch and when pressed, disables or enables the traction control or Advance Trac®/IVD.

Power is supplied by circuit 20-CF54 (PK/WH). Circuit 8-CF54 (WH/VT) provides the switch input signal to the ABS module. Current to the disable LED lamp from the ABS module is supplied by circuit 31S-CF45 (BK/GN).

Possible Causes
- Traction Control/Advance Trac®/IVD switch
- power circuit 20-CF54 (PK/WH)
- switch signal circuit 8-CF54 (WH/VT) short to voltage
- LED lamp circuit 31S-CF45 (BK/GN) short to ground or short to voltage
- ABS module

PINPOINT TEST Q: DTC C1969 TRACTION CONTROL/YAW CONTROL SWITCH CIRCUIT FAULT

Test Step	Result / Action to Take
Q1 CHECK FOR DTCs	
• Connect the diagnostic tool. • Retrieve and document continuous DTCs. • **Are any DTCs retrieved?**	**Yes** GO to the ABS Module Diagnostic Trouble Code (DTC) Index. **No** GO to Q2 .
Q2 CHECK THE ADVANCE TRAC®/IVD SWITCH	
• Disconnect: Advance Trac®/IVD Switch C3208. • Key in OFF position. • Press and hold the Advance Trac®/IVD switch in the ON position. • Measure the resistance between the Advance Trac®/IVD switch C3208-4, circuit 8-CF54 (WH/VT), component side and between the Advance Trac®/IVD switch C3208-3, circuit 20-CF54 (PK/WH), component side.	**Yes** INSTALL a new Advance Trac®/IVD switch. TEST the system for normal operation. **No** GO to Q3 .

 N0002990 • **Is the resistance greater than 5 ohms?**	
Q3 CHECK THE VOLTAGE TO THE ADVANCE TRAC®/IVD SWITCH	
• Key in ON position. • Measure the voltage between the Advance Trac®/IVD switch C3208-3, circuit 20-CF54 (PK/WH), harness side and ground.  N0002993 • **Is the voltage greater than 10 volts?**	**Yes** GO to Q4 . **No** REPAIR the circuit in question. TEST the system for normal operation.
Q4 CHECK THE ADVANCE TRAC®/IVD SWITCH INPUT	
• Key in OFF position. • Connect: Advance Trac®/IVD Switch C3208. • Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the ABS module C155-38, circuit 8-CF54 (WH/VT), harness side and ground while pressing the Advance Trac®/IVD switch ON.  A0073310 • **Is the voltage greater than 10 volts?**	**Yes** RELEASE the Advance Trac®/IVD switch. If the voltage drops to less than 2 volts, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. GO to Q5 . **No** REPAIR the circuit in question. TEST the system for normal operation.
Q5 CHECK CIRCUIT 8-CF54 (WH/VT) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: ABS Module C155. • Key in ON position. • Measure the voltage between the ABS module C155-38, circuit 8-CF54 (WH/VT), harness side and ground.	**Yes** REPAIR the circuit. CLEAR the DTC. REPEAT the self-test. **No** GO to Q6 .

 A0073310 • **Is any voltage present?**	
Q6 CHECK CIRCUIT 31S-CF45 (BK/GN) FOR A SHORT TO VOLTAGE	
• Measure the voltage between the ABS module C155-13, circuit 31S-CF45 (BK/GN), harness side and ground; and between the Advance Trac®/IVD switch C3208-1, circuit 31S-CF45 (BK/GN), harness side and ground.  N0002994 • **Is voltage present?**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to Q7 .
Q7 CHECK CIRCUIT 31S-CF45 (BK/GN) FOR A SHORT TO GROUND	
• Measure the resistance between the ABS module C155-13, circuit 31S-CF45 (BK/GN), harness side and ground.  N0002995 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. TEST the system for normal operation. **No** REPAIR the circuit in question. TEST the system for normal operation.

Pinpoint Test R: DTC C1998 Module Calibration Not Complete

Normal Operation

The Advance Trac®/IVD system needs to be recalibrated whenever a component specific to the system is disconnected or a new component is installed.

Possible Causes

- Disconnected/reconnected Advance Trac®/IVD component:
  - ♦ module
  - ♦ yaw rate sensor/accelerometer
  - ♦ steering wheel rotation sensor
- clearing of Advance Trac®/IVD component related DTCs. (Refer to the Calibration List of DTCs)

PINPOINT TEST R: DTC C1998 MODULE CALIBRATION NOT COMPLETE

NOTE: The Advance Trac®/IVD lamp will flash when a system calibration is required. Calibration is required after certain DTCs are cleared.

NOTE: Make sure the vehicle is not on a hoist and is sitting on level ground before performing stability assist module calibration.

Test Step	Result / Action to Take
R1 CHECK FOR DTCs	
• Connect the diagnostic tool. • Key in ON position. • Retrieve DTCs. • **Is any other DTC retrieved with C1998?**	**Yes** GO to the appropriate pinpoint test for the DTC. Some of the pinpoint tests recommend IVD calibration prior to any further diagnostics, in this case, GO to R2 . **No** GO to R2 .
R2 ADVANCE TRAC®/IVD CALIBRATION	
• Connect the diagnostic tool. • Key in ON position. • **NOTE:** Be sure to rotate the steering wheel lock-to-lock during the calibration of the ABS system. • With the engine running carry out the Advance Trac®/IVD calibration per the diagnostic tool instructions. • **Did calibration complete for all IVD sensors? And did the Advance Trac®/IVD lamp stop flashing and go off?**	**Yes** GO to R3 . **No** GO to R4 . Some concerns will cause a calibration not complete. If sent here from another pinpoint test, return to that pinpoint test for further diagnostics.
R3 CLEAR DTC C1998	
NOTE: Clear DTC C1998 after completing the calibration. • Connect the diagnostic tool. • Key in ON position. • Clear the DTC. • **Did the DTC clear?**	**Yes** TEST DRIVE the vehicle. REPEAT the self-test. If sent here from another pinpoint test, return to that pinpoint test for further diagnostics. **No** GO to R4 .
R4 MONITOR THE STEERING POSITION SENSOR PIDS	
• Key in ON position. • Monitor the anti-lock brake system (ABS) module steering position sensor PIDS while rotating the steering wheel clockwise and counterclockwise. • **Are the 2 steering position sensor PID values switching as the wheel rotates?**	**Yes** Go To Pinpoint Test H . **No** Go To Pinpoint Test G .

Pinpoint Test S: DTC C2777 and DTC C2778 Sensor Cluster Bus Failure

Normal Operation

The yaw rate sensor and accelerometer are part of the sensor cluster which sends various signals about the vehicle's dynamics through a 2-wire bus controller area network (CAN) 4-CF66 (GY/VT) and CAN 5-CF66 (BU/WH). The CAN bus receives a twelve-volt input through circuit 7-CF67 (YE/RD) in series with the steering wheel rotation sensor circuitry. Ground is provided through circuit 9-CF67 (BN/RD).

Possible Causes

- power circuit 7-CF67 (YE/RD) open, short to ground, or short to power
- ground circuit 9-CF67 (BN/RD) open, short to ground, or short to power
- steering wheel rotation sensor
- circuit 4-CF66 (GY/VT)
- circuit 5-CF66 (BU/WH)
- sensor cluster
- anti-lock brake system (ABS) module

PINPOINT TEST S: DTC C2777 AND DTC C2778 SENSOR CLUSTER BUS FAILURE

NOTE: Measure all pins of the sensor cluster and ABS module when removing connectors. Care should be taken when reinstalling these connectors.

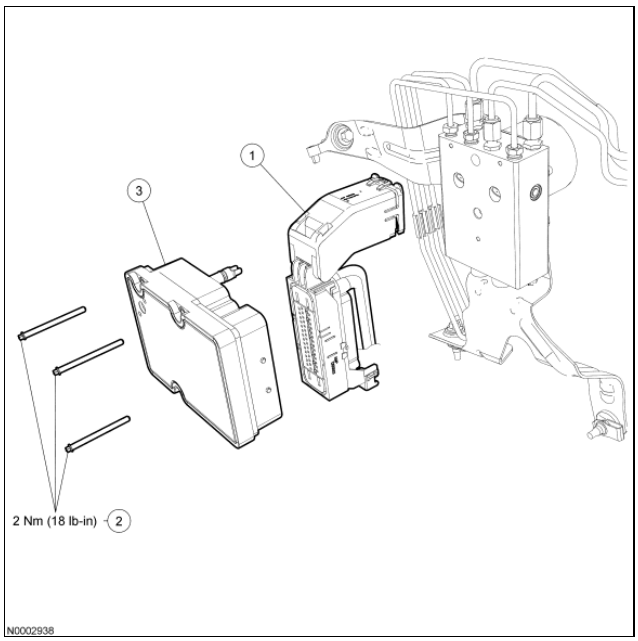
Test Step	Result / Action to Take
S1 CHECK THE VOLTAGE TO THE SENSOR CLUSTER	
• Key in OFF position. • Disconnect: Sensor Cluster C3073. • Key in ON position. • Measure the voltage between the sensor cluster C3073-3, circuit 7-CF67 (YE/RD), harness side and ground.  N0002996 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new sensor cluster. REFER to Yaw Rate Sensor in this section. CLEAR the diagnostic trouble codes (DTCs). RECALIBRATE the system. REPEAT the self-test. **No** GO to S2 .
S2 CHECK THE STEERING WHEEL ROTATION SENSOR	
• Disconnect: Steering Wheel Rotation Sensor C226. • Measure the voltage between the sensor cluster C3073-3, circuit 7-CF67 (YE/RD), harness side and ground.  N0002996	**Yes** INSTALL a new steering wheel rotation sensor. REFER to Steering Wheel Rotation Sensor in this section. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test. **No** GO to S3 .

• **Is the voltage greater than 10 volts?**	
S3 CHECK CIRCUIT 7-CF67 (YE/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: ABS Module C155. • Measure the resistance between the sensor cluster C3073-3, circuit 7-CF67 (YE/RD), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S4 . **No** REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test.
S4 CHECK CIRCUIT 7-CF67 (YE/RD) FOR AN OPEN FROM THE SENSOR CLUSTER	
• Measure the resistance between the steering wheel rotation sensor C226-1, 7-CC16A (YE/BK), harness side and the ABS module C155-7, circuit 7-CC1 (YE/RD), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** GO to S5 . **No** REPAIR the circuit. CLEAR the DTCs. RECALIBRATE the system. REPEAT the self-test.
S5 CHECK THE CAN BUS CIRCUITS FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the sensor cluster C3073-1, circuit 5-CF66 (BU/WH), harness side and ground; and between the sensor cluster C3073-2, circuit 4-CF66 (GY/VT), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test. **No** GO to S6 .
S6 CHECK THE CAN BUS CIRCUITS FOR A SHORT TO GROUND	

• Key in OFF position. • Measure the resistance between the sensor cluster C3073-1, circuit 5-CF66 (BU/WH), harness side and ground; and between the sensor cluster C3073-2, circuit 4-CF66 (GY/VT), harness side and ground.  N0008725 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S7 . **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test.
S7 CHECK THE CAN BUS CIRCUITS FOR A SHORT TOGETHER	
• Measure the resistance between the sensor cluster C3073-1, circuit 5-CF66 (BU/WH), harness side and the sensor cluster C3073-2, circuit 4-CF66 (GY/VT), harness side.  N0008726 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to S8 . **No** REPAIR circuit 4-CF66 (GY/VT) and circuit 5-CF66 (BU/WH). CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test.
S8 CHECK THE CAN BUS CIRCUITS FOR AN OPEN	
• Measure the resistance between sensor cluster C3073-1, circuit 5-CF66 (BU/WH), harness side and the ABS module C155-25, circuit 5-CF66 (BU/WH), harness side; and between the sensor cluster C3073-2, circuit 4-CF66 (GY/VT), harness side and the ABS module C155-29, circuit 4-CF66 (GY/VT), harness side.  N0008727 • Measure the resistance . • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new yaw rate sensor. REFER to Yaw Rate Sensor in this section. CLEAR the DTCs. RECALIBRATE the system. TEST DRIVE the vehicle. REPEAT the self-test. If DTC C2777 or C2778 is retrieved, INSTALL a new ABS module. REFER to Anti-Lock Brake System (ABS) Module in this section. CLEAR the DTC. RECONFIGURE the ABS module. RECALIBRATE the system. REPEAT the self-test. **No** REPAIR the circuit in question. CLEAR the DTC. RECALIBRATE the system. REPEAT the self-test.

Anti-Lock Brake System (ABS) Module

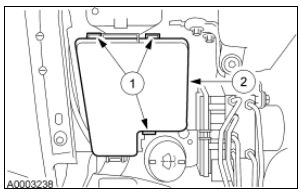
Printable View (129 KB)



Item	Part Number	Description
1		Anti-lock brake system (ABS) module electrical connector
2	2M101	ABS module bolts (3 required)
3	2C219	ABS module

Removal and Installation

1. Position the battery junction box (BJB) aside.
    1. Release the clips.
    2. Position the BJB aside.



2. Disconnect the ABS electrical connector.

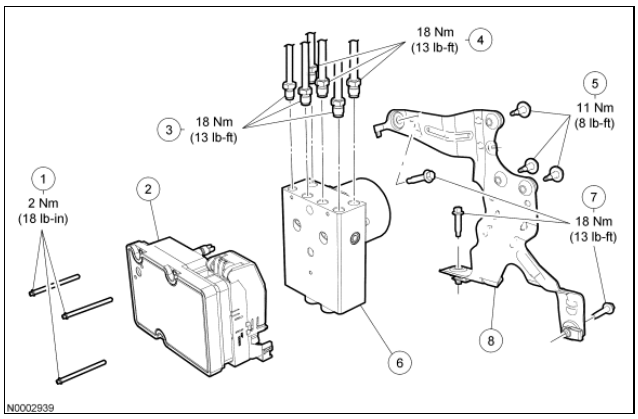
3. Remove the 3 ABS module screws and the ABS module.
    - To install, tighten to 2 Nm (18 lb-in).

4. **NOTE:** Use the diagnostic tool to configure the ABS module. For additional information, refer to Section 418-01 .

    To install, reverse the removal procedure.

Hydraulic Control Unit (HCU)

Printable View (108 KB)



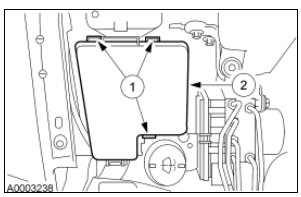
Item	Part Number	Description
1	2M101	Anti-lock brake system (ABS) module-to-HCU bolts (3 required)
2	2C219	Anti-lock brake system (ABS) module
3	2C292	Brake line nuts-to-HCU (M10) (3 required)
4	2C326	Brake line nuts-to-HCU (M12) (3 required)
5	3B676	HCU bracket-to-HCU bolts (3 required)
6	2C286	HCU
7	2C348	HCU bracket-to-body bolts (3 required)
8	2C304	HCU bracket

Removal and Installation

⚠ WARNING: Brake fluid contains polyglycol ethers and polyglycols. Avoid contact with eyes. Wash hands thoroughly after handling. If brake fluid contacts eyes, flush eyes with running water for 15 minutes. Get medical attention if irritation persists. If taken internally, drink water and induce vomiting. Get medical attention immediately. Failure to follow these instruction may result in personal injury.

⚠ CAUTION: Brake fluid is harmful to painted and plastic surfaces. If brake fluid is spilled onto a painted or plastic surface, immediately wash it with water.

1. Position the battery junction box (BJB) aside.
    1. Release the clips.
    2. Position the BJB aside.



2. Remove the 3 bolts and position the ABS module aside.
    - To install, tighten to 2 Nm (18 lb-in).

3. **NOTE:** The brake lines must be installed in the same location as removed.

   Remove the 3 brake line nuts-to-HCU (M10) and position the brake lines aside.

   - To install, tighten to 18 Nm (13 lb-ft).

4. **NOTE:** The brake lines must be installed in the same location as removed.

   Remove the 3 brake line nuts-to-HCU (M12) and position the brake lines aside.

   - To install, tighten to 18 Nm (13 lb-ft).

5. Remove the 3 HCU bracket-to-HCU bolts and the HCU assembly.
   - To install, tighten to 11 Nm (8 lb-ft).

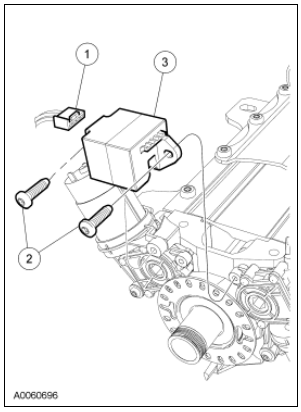
6. Remove the 3 HCU bracket-to-body bolts and the HCU bracket.
   - To install, tighten to 18 Nm (13 lb-ft).

7. To install, reverse the removal procedure.
   - Bleed the brake system. For additional information, refer to Section 206-00 .

Steering Wheel Rotation Sensor

Printable View (65 KB)

Removal and Installation



Item	Part Number	Description
1		Steering wheel rotation sensor electrical connector
2		Screws (2 required)
3	3F818	Steering wheel rotation sensor

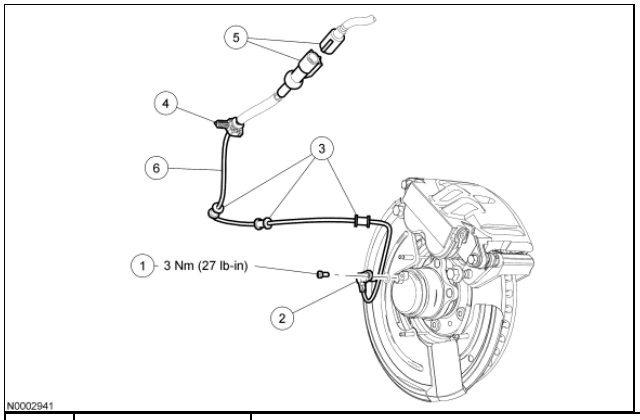
1. Disconnect the steering wheel rotation sensor electrical connector.
2. Remove the 2 screws and the steering wheel rotation sensor.
3. To install, reverse the removal procedure.

Wheel Speed Sensor Front

Printable View (91 KB)

Material

Item	Specification
Silicone Gasket and Sealant TA-30	WSE-M4G323-A4



Item	Part Number	Description
1	W709792-S	Wheel speed sensor bolt
2	2C204	Wheel speed sensor
3		Wheel speed sensor harness retainer (part of 2C190)
4		Wheel speed sensor harness pin-type retainer (part of 2C190)
5		Wheel speed sensor electrical connector
6	2C190	Wheel speed sensor harness

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. **NOTE:** Make sure the wheel speed sensor is fully seated before installation of the new bolt.

   Remove the wheel speed sensor bolt.

   - To install, tighten to 3 Nm (27 lb-in).

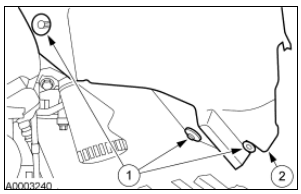
3. **NOTE:** Install a new O-ring.

   Remove the wheel speed sensor.

4. Remove the 3 wheel speed sensor harness retainers.

5. Remove the wheel speed sensor harness pin-type retainers.

6. Gain access to the wheel speed sensor harness.
    1. Remove the pin-type retainers.
    2. Position the inner splash shield aside.



7. Disconnect the wheel speed sensor electrical connector.

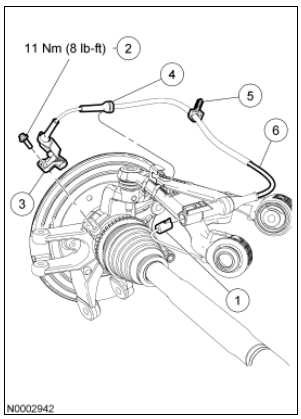
8. **NOTE:** Apply a 2.5 mm (0.1 in) bead of sealant to the outside diameter of the wheel speed sensor.

   Remove the wheel speed sensor and the harness.

9. To install, reverse the removal procedure.

Wheel Speed Sensor Rear

Printable View (65 KB)



Item	Part Number	Description
1	14407	Wheel speed sensor electrical connector
2	W500212-S	Wheel speed sensor bolt
3	2C381	Wheel speed sensor
4		Wheel speed sensor harness retainer (part of 2C190) (3 required)
5		Wheel speed sensor harness pin-type retainer (part of 2C190)
6	2C190	Wheel speed sensor harness

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the wheel speed sensor electrical connector.

3. Remove the wheel speed sensor bolt.
   - To install, tighten to 11 Nm (8 lb-ft).

4. **NOTE:** Clean off all dirt and foreign material that may have collected around the rear anti-lock brake sensor before removal.

   Remove the wheel speed sensor.

5. Remove the wheel speed sensor harness retainer.

6. Remove the wheel speed sensor harness pin-type retainer.

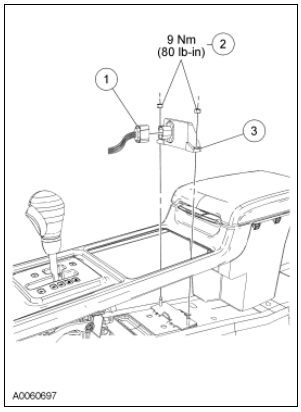
7. Remove the wheel speed sensor and harness assembly.

8. To install, reverse the removal procedure.

Yaw Rate Sensor

Printable View (53 KB)

Removal and Installation



Item	Part Number	Description
1	2C011	Yaw rate sensor electrical connector
2	W700101-S	Yaw rate sensor bracket nuts (2 required)
3	3C296	Yaw rate sensor

NOTE: When installing a new yaw rate sensor, the anti-lock brake system (ABS) module must be configured (using vehicle as-built data) and calibrated. Follow the diagnostic tool directions for the calibration procedures. For module configuration, refer to Section 418-01 .

1. If equipped, remove the floor console. For additional information, refer to Section 501-12 .

2. **NOTE:** Fold back the carpeting flap to gain access to the yaw rate sensor.

   Disconnect the yaw rate sensor electrical connector.

3. Remove the 2 nuts and the yaw rate sensor.
   - To install, tighten to 9 Nm (80 lb-in).

4. To install, reverse the removal procedure.

Transmission Description

Printable View (35 KB)

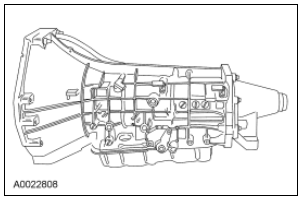
This transmission has:

- five forward speeds.
- electronic shift, pressure and torque converter clutch controls.
- three compound planetary gearsets.
- three bands.
- three multi-plate clutches.
- two one-way clutches.

All hydraulic functions are directed by electronic solenoids. The solenoids control:

- static engagement feel.
- shift feel.
- shift scheduling.
- moded torque converter clutch (TCC) applications.
- engine braking utilizing the coast clutch and band.
- manual first and second timing.
- reverse inhibit timing.

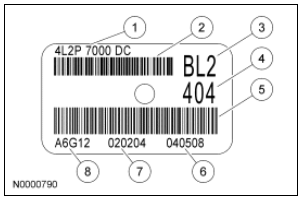
Transmission View



Identification Tags

Printable View (24 KB)

ID Tag Located on Transmission Case



Item	Description
1	Transmission part number
2	Bar code 1
3	Transmission plant model code part 1
4	Transmission plant model code part 2
5	Bar code 2
6	Transmission serial number
7	Transmission build date (DD MM YY)
8	Assembly plant line shift

All vehicles are equipped with a vehicle certification label, located on the driver side door lock post. Refer to the code in the space marked TR. For model, service ID level or build date information, refer to the transmission service ID tag located on the transmission case.

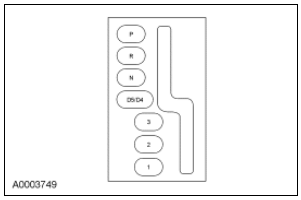
Range Selection

Printable View (28 KB)

Depending on the vehicle options selected, the transmission range selector may have different range positions.

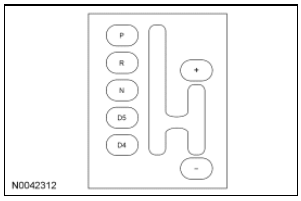
The standard range selector has eight positions: P, R, N, D5, 4, 3, 2 and 1.

Base Range Shifter



The optional select shift transmission (SST) range selector has seven positions P, R, N, D5, D4, + and -. This option will allow the driver to manually upshift and downshift into any gear range.

Optional Range Shifter



Park

In the PARK position:

- there is no power flow through the transmission.
- the parking pawl locks the output shaft to the case.
- the engine may be started.
- the ignition key may be removed.

Reverse

In the REVERSE position:

- the vehicle may be operated in a rearward direction, at a reduced gear ratio.
- backup lamps are illuminated.

Neutral

In the NEUTRAL position:

- there is no power flow through the transmission.
- the output shaft is not held and is free to turn.
- the engine may be started.

D5 (Overdrive)

D5 (overdrive) is the normal position for most forward driving.

The D5 (overdrive) position provides:

- automatic shift 1-5 and 5-1.
- apply and release of the torque converter clutch.
- maximum fuel economy during normal operation.
- engine braking in 5th gear.

D4 (Overdrive Canceled)

This position provides:

- automatic shift 1-4 and 4-1.
- apply and release of the torque converter clutch.
- engine braking in 4th gear.

Position 3 3rd Gear (Base Shifter)

This position provides:

- third gear start and hold.
- the torque converter clutch may apply and release.
- improved traction on slippery roads.
- engine braking.

Position 2 2nd Gear (Base Shifter)

This position provides:

- second gear start and hold.
- the torque converter clutch may apply and release.
- improved traction on slippery roads.
- engine braking.

Position 1 1st Gear (Base Shifter)

If position 1 is selected at normal road speeds, the transmission will downshift into the next lower gear and continue downshifting until the vehicle reaches 1st gear.

This position provides:

- first gear operation only.
- engine braking for descending steep grades.

+ and - Position Operation (Optional Shifter)

These positions allow the driver to manually select the appropriate upshift (+) or downshift (-) and gear range.

- Can only be entered from the D5 position.
- Gear ranges 1-5 provide the same function and ratio as found in the D5 or D4 automatic mode positions.
- Transmission will not upshift or downshift unless the selector lever is moved forward or rearward.
- One tap forward (+) will command the transmission to upshift one gear range.

- One tap rearward (-) will command the transmission to downshift one gear range.
- Upshifts are allowed at any vehicle speed.
- A 2nd gear start up is normal. A 3rd gear start up will be allowed only if selected. All other selections will revert to 2nd gear.
- If the driver starts in 2nd gear and does not pass 60% throttle, the transmission will remain in 2nd gear. No automatic shift will occur.
- If the driver passes 60% throttle, then a 2-1 automatic kickdown will occur, scheduled by the PCM as used in D5. Once this has occurred, 1st gear will hold until 2nd gear is selected by the driver moving the shift handle. No automatic upshift is possible under this condition.
- Once a kickdown has occurred, manual shifting in and out of 1st gear is allowed until the next time the vehicle stops.
- A shift to 1st gear with the vehicle at rest is never allowed.
- When downshifting at normal road speeds, the transmission will only allow a downshift into the next lower gear.
- If the shifter (-) is tapped more than once in rapid succession, the transmission will downshift only into the next lower gear. Then when the vehicle reaches a speed below a calibrated entry speed, the transmission will allow a downshift into the next lower gear, if again selected by the driver. This is to prevent engine and transmission damage and to keep the engine and transmission within allowable rpm ranges.
- An electronic indicator on the instrument cluster will display the selected gear.

Park Sense Switch

The park sense switch prevents the redundant PRNDL from displaying "P" until the shifter is in the PARK position.

Electronic Transmission Error Indicator

The vehicle is equipped with a redundant electronic gearshift indicator. This character appears with the key in the run position and displays the same gear selection as shown on the range selector floor console next to the range selector lever. If an "E" character flashes or remains on, this indicates a transmission malfunction.

Shift Patterns

Printable View (9 KB)

Upshifts

Transmission upshifting is controlled by the powertrain control module (PCM). The PCM receives inputs from various engine or vehicle sensors and driver demands to control shift scheduling, shift feel and torque converter clutch (TCC) operation.

The PCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel. When the battery has been disconnected or a new battery installed, certain transmission operating parameters may be lost. The PCM must relearn these parameters. During this learning process you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Downshifts

Under certain conditions the transmission will downshift automatically to a lower gear range (without moving the range selector lever). There are 3 categories of automatic downshifts: coastdown, torque demand and forced (or kickdown) shifts.

Coastdown

The coastdown downshift occurs when the vehicle is coasting down to a stop.

Torque Demand

The torque demand downshift occurs (automatically) during part throttle acceleration when the demand for torque is greater than the engine can provide at that gear ratio. If applied, the transmission will disengage the TCC to provide added acceleration.

Kickdown

For maximum acceleration, the driver can force a downshift by pressing the accelerator pedal to the floor. A forced downshift into a lower gear is possible below calibrated speeds. Specifications for downshift speeds are subject to variations due to tire size and engine and transmission calibration requirements.

Torque Converter

Printable View (7 KB)

The torque converter transmits and multiplies torque. The torque converter is a 4-element device:

- Impeller assembly
- Turbine and damper assembly
- Reactor assembly
- Clutch

The standard torque converter components operate as follows:

- Rotation of the converter housing and impeller sets the fluid in motion.
- The turbine reacts to the fluid motion from the impeller, transferring rotation to the geartrain through the input shaft.
- The reactor redirects fluid going back into the impeller, allowing for torque multiplication.
- The clutch and damper assembly dampens powertrain torsional vibration and provides a direct mechanical connection for improved efficiency.
- Power is transmitted from the torque converter to the planetary gearsets and other components through the input shaft.

Geartrain

Printable View (13 KB)

Power is transmitted from the torque converter to the planetary gearsets through the input shaft. Bands and clutches are used to hold and drive certain combinations of gearsets. This results in 5 forward ratios and 1 reverse ratio, which are transmitted to the output shaft and differential.

Gear Ratio	
1st	3.22 to 1
2nd	2.29 to 1
3rd	1.55 to 1
4th	1.00 to 1
5th	0.71 to 1
Reverse	3.07 to 1

Planetary Gearset Overdrive

For component location, refer to Transmission in this section.

The planetary gear overdrive carrier is driven by the input shaft.

- The overdrive planetary gearset carrier drives the center shaft via the overdrive one-way clutch in 1st, 3rd, 4th and REVERSE gears.
- In 2nd and 5th gears, the overdrive sun gear is held causing the pinion gears to rotate around the overdrive sun gear.
- The pinion gears, in turn, drive the overdrive ring gear resulting in the 5th (overdrive) gear ratio.
- The overdrive planetary gearset is internally splined to the coast clutch for engine braking.

Planetary Gearset Forward

For component location, refer to Transmission in this section.

The forward planetary gearset is splined to the output shaft.

- The forward planetary gearset is driven by the forward ring gear when the forward clutch is applied.
- The forward planetary gearset pinions drive the forward sun gear.
- The forward sun gear is splined to the input shell.
- The forward carrier is splined to the output shaft.

Planetary Gearset Low/Reverse

For component location, refer to Transmission in this section.

The low/reverse planetary gearset is connected to the reverse brake drum by lugs from the low/reverse brake drum to the lugs of the low/reverse planetary gearset.

- The low/reverse planetary gearset is driven by the forward sun gear which is splined to the input shell.
- The forward sun gear drives the pinions in the low/reverse planetary gearset.
- The pinions of the low/reverse planetary gearset drive the output shaft ring gear and output shaft hub which is splined to the output shaft.
- The low/reverse planetary gearset can be held by the low one-way clutch in the low/reverse brake drum, or by the low/reverse band.

Input Shaft

For component location, refer to Transmission in this section.

- The radial positioning of the input shaft is controlled by 2 bushings in the stator support.
- Axial positioning of the input shaft is controlled by the splines in the converter turbine hub and the retaining ring in the overdrive planetary carrier.

Output Shaft

For component location, refer to Transmission in this section.

The output shaft is supported by a bearing in the case and by a bearing in the extension housing. End positioning is controlled by the parking gear and by the reverse ring gear hub and snap ring.

Apply Components

Printable View (15 KB)

Band Overdrive

For component location, refer to Transmission in this section.

During 2nd and 5th gear operation, hydraulic pressure is applied to the overdrive servo.

- This pressure causes the piston to move and apply force to the band.
- This action causes the overdrive band to hold the overdrive drum.
- This causes the overdrive sun gear to be held stationary through the adapter plate and the overdrive drum.

Band Low/Reverse

For component location, refer to Transmission in this section.

During 2nd gear, 1st gear and reverse operation, hydraulic pressure is applied to the low/reverse servo.

- This pressure causes the servo to move and apply force to the low/reverse band.
- This action causes the low/reverse brake drum to be held.
- This action causes the low/reverse planetary assembly to be held stationary.

Band Intermediate

For component location, refer to Transmission in this section.

During 3rd gear operation, hydraulic pressure is applied to the intermediate servo.

- This pressure causes the servo to move and apply force to the intermediate band.
- This action causes the direct clutch drum to be held.
- The intermediate band holds the intermediate brake and direct clutch drum to the case in 3rd gear.
- This causes the input shell and forward sun gear to be held stationary.

Clutches Direct

For component location, refer to Transmission in this section.

The direct clutch is a multi-disc clutch made up of steel and friction plates.

- The direct clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- It is housed in the direct clutch drum.
- During 4th, 5th and REVERSE gear application, the direct clutch is applied transferring torque from the forward clutch cylinder to the direct clutch drum.
- This action causes the forward sun gear to drive the pinions of the low/reverse planetary carrier.

Clutches Forward

For component location, refer to Transmission in this section.

The forward clutch is a multi-disc clutch made up of steel and friction plates.

- The forward clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- The forward clutch is applied in all forward gears.
- When applied, the forward clutch provides a direct mechanical coupling between the center shaft and the forward ring gear and hub.

Clutches Coast

For component location, refer to Transmission in this section.

The coast clutch is a multi-disc clutch made up of steel and friction plates.

- The coast clutch is applied with hydraulic pressure and disengaged by return springs and the exhaust of the hydraulic pressure.
- The coast clutch is housed in the overdrive drum.
- The coast clutch is applied when in 1st, 3rd, DRIVE and REVERSE positions.
- When applied, the coast clutch locks the overdrive sun gear to the overdrive planetary carrier, thus preventing the one-way clutch from overrunning when the vehicle is coasting.
    - ♦ This allows the use of engine compression to help slow the vehicle and provide engine braking.

One-Way Clutch Direct

For component location, refer to Transmission in this section.

The direct one-way clutch is a sprag-type one-way clutch that is pressed into the center shaft.

- The direct one-way clutch is driven by the ring gear of the overdrive planetary carrier.
- The direct one-way clutch holds and drives the outer splines of the center shaft in 1st, 3rd, 4th and REVERSE gears.
- The direct one-way clutch overruns during all coast operations and at all times in 2nd and 5th gear.

One-Way Clutch Low/Reverse

For component location, refer to Transmission in this section.

The low/reverse one-way clutch is a sprag-type one-way clutch.

- The low/reverse one-way clutch holds the low/reverse drum and low/reverse planetary assembly to the case in 1st and 2nd gear.
- In all other gears the low/reverse one-way clutch overruns.

Hydraulic System

Printable View (9 KB)

Fluid Pump

For component location, refer to Transmission in this section.

- The fluid pump provides the fluid pressure necessary to charge the torque converter, main control assembly, transmission cooling system, lubrication system and apply devices.
- The fluid pump is a positive displacement, gear type pump.
  - The fluid pump is driven by the torque converter impeller hub.

Filter

For component location, refer to Transmission in this section.

- All fluid drawn from the transmission fluid pan by the fluid pump passes through the fluid filter.
- The transmission fluid filter and its accompanying seals are part of the fluid path from the sump (pan) to the fluid pump.
  - The transmission fluid filter has a bypass section which allows fluid vented at the main regulator valve to be recirculated to the fluid pump, without passing through the transmission fluid filter.

Main Control

For component location, refer to Transmission in this section.

- The main control assembly and related components are part of the pressure side of the hydraulic system.
- The main control assembly consists of the solenoids, the valve body assembly and the separator plate.
- These components combine to convert electrical signals into hydraulic actions.
  - All valves in the main control assembly are an odized aluminum and cannot be sanded, filed or dressed in any other way. If there is any damage to the valves that prevents or restricts their movement, install a new main control assembly.

Transmission Electronic Control System

Printable View (18 KB)

Electronic System Description

The powertrain control module and its input/output network control the following transmission operations:

- shift timing.
- line pressure (shift feel).
- torque converter clutch.

The transmission control strategy combined with the engine control provides optimum powertrain operation under all conditions. When determining the best operating strategy for transmission operation, the PCM uses input information from certain engine-related and driver-demand related sensors and switches.

In addition, the PCM receives input signals from certain transmission-related sensors and switches. The PCM also uses these signals when determining transmission operating strategy.

Using all of these input signals, the PCM can determine when the time and conditions are right for a shift, or when to apply or release the torque converter clutch. It will also determine the pressure needed to optimize shift feel. To accomplish this, the PCM uses 3 pressure controls, 1 torque converter clutch and 4 shift solenoids to control transmission operation.

The following provides a brief description of each of the sensors and actuators used to control transmission operation.

Powertrain Control Module

The operation of the transmission is controlled by the powertrain control module. Many input sensors provide information to the powertrain control module. The powertrain control module then controls the actuators which determine transmission operation.

Air Conditioning (A/C) Clutch

An electromagnetic clutch is energized when the clutch cycling pressure switch closes. The switch is located on the suction accumulator/drier. The closing of the switch completes the circuit to the clutch and draws it into engagement with the compressor driveshaft. When the A/C is engaged, operating pressures are adjusted to compensate for additional load on the engine.

Brake Pedal Position (BPP) Switch

The brake pedal position (BPP) switch tells the powertrain control module (PCM) when the brakes are applied. The torque converter clutch disengages when the brakes are applied. The BPP switch closes when the brakes are applied and opens when they are released. The BPP is also used to disengage the brake shift interlock.

Engine Coolant Temperature (ECT) Sensor

The engine coolant temperature (ECT) sensor detects engine coolant temperature and supplies the information to the PCM. The ECT sensor is used to control torque converter clutch (TCC) operation.

Electronic Ignition (EI) System

The electronic ignition consists of a crankshaft position sensor, two four-tower ignition coils and the powertrain control module. The ignition control module operates by sending crankshaft position information from the crankshaft position sensor to the ignition control module. The ignition control module generates a profile ignition pickup (PIP) signal (engine rpm) and sends it to the PCM. The PCM uses PIP signal in the transmission strategy, wide-open throttle (WOT) shift control, torque converter clutch control and operating pressures.

Intake Air Temperature (IAT) Sensor

The intake air temperature (IAT) sensor provides the sequential fuel injection (SFI) system mixture temperature information. The IAT sensor is used both as a density corrector for air flow calculation and to proportion cold enrichment fuel flow. The IAT sensor is installed in the air cleaner outlet tube. The IAT sensor is also used in determining control pressures.

Mass Air Flow (MAF) Sensor

The mass air flow sensor measures the mass of air flowing into the engine. The MAF sensor output signal is used by the powertrain control module (PCM) to calculate injector pulse width. For transmission strategies, the MAF sensor is used to regulate electronic pressure control, shift and torque converter clutch scheduling.

Transmission Control Switch (TCS)

The transmission control switch (TCS) sends a signal to the powertrain control module (PCM) when the driver selects the D4 position, canceling operation of 5th (overdrive) gear.

The TCS is located within the range selector assembly (base shifter only).

The PCM uses this signal to control the shift solenoids to disengage/disable 5th gear operation and activates coast clutch. At the same time, the PCM changes the instrument panel indicator to display D4.

When the driver moves the range selector lever back to the D5 position, 5th gear operation is enabled, the coast clutch is released and the instrument panel indicator changes to display D5.

Throttle Position (TP) Sensor

The throttle position (TP) sensor is a potentiometer mounted on the throttle body. The TP sensor detects the position of the throttle plate and sends this information to the powertrain control module. The TP sensor is used for shift scheduling, electronic pressure control and torque converter clutch (TCC) control.

Digital Transmission Range (TR) Sensor

The digital transmission range (TR) sensor is located on the outside of the transmission at the manual lever. The digital TR sensor completes the start circuit in PARK, NEUTRAL, and the back-up lamp circuit in REVERSE. The digital TR sensor also opens and closes a set of 4 switches that are monitored by the powertrain control module to determine the position of the manual lever (P, R, N, D5, 3, 2, 1).

Turbine Shaft Speed (TSS) Sensor

The turbine shaft speed (TSS) sensor is a magnetic pickup that sends the powertrain control module torque converter turbine speed information.

The TSS sensor is mounted externally on the case.

The PCM uses TSS information to help determine appropriate operating pressures and torque converter clutch

(TCC) operation.

Output Shaft Speed (OSS) Sensor

The output shaft speed (OSS) sensor is a magnetic pickup, located at the park gear, that sends a signal to the powertrain control module to indicate transmission output shaft speed. The OSS sensor is mounted externally on the case. The OSS is used for torque converter clutch control, speed scheduling and to determine electronic pressure control.

Intermediate Shaft Speed Sensor

The intermediate shaft speed sensor is a magnetic pickup that sends planetary sun gear speed information to the PCM. The sensor is mounted externally on the center of the case.

The PCM uses the sensor information to aid in determining pressure requirements.

Pressure Control Solenoids (PCA, PCB, PCC)

The pressure control (PC) solenoids are a variable-force style (VFS) solenoid. The VFS-type solenoid is an electrohydraulic actuator combining a solenoid and a regulating valve.

The line pressure tap is used to verify output pressure from PC A or PC B by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the PC C solenoid.

There are 3 PC solenoids located in the solenoid body assembly used to control line pressure, band and clutch application pressure within the transmission.

The powertrain control module varies the current to the PC solenoid.

The PCM has an adaptive learn strategy to electronically control the transmission which will automatically adjust the shift feel. When the battery is disconnected or a new battery installed, certain transmission operating parameters can be lost. The Powertrain Control Module (PCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

Torque Converter Clutch (TCC) Solenoid

The torque converter clutch (TCC) solenoid is a pulse-width-modulating type solenoid that is used to control the apply and release of the TCC.

Shift Solenoids (SSA, SSB, SSC, SSD)

Four On/Off shift solenoids allow the powertrain control module to control shift scheduling.

- The solenoids are 3-way, normally open style.
- The shift solenoids SSA, SSB, SSC and SSD provide gear selection of 1st through 5th and reverse gears by directing PC pressures to the appropriate elements.

Coast braking and manual gears are also controlled by the shift solenoids.

Transmission Fluid Temperature (TFT) Sensor

- The transmission fluid temperature (TFT) sensor is a thermistor-type sensor that varies a reference voltage signal. The resistance in the TFT varies with temperature. The powertrain control module (PCM) monitors the voltage signal across the TFT, and uses this information to determine the transmission fluid temperature.
- The TFT is located on the solenoid body.
- The PCM uses the TFT signal to help determine shift scheduling, torque converter clutch operation and pressure control requirements.

It sends a voltage signal to the powertrain control module. The voltage signal varies with transmission fluid temperature. The PCM uses this signal to determine whether a cold start shift schedule is necessary. The shift schedule is compensated when the transmission fluid temperature is cold. The PCM also inhibits torque converter clutch (TCC) operation at low transmission fluid temperatures and determines pressure control (PC) solenoid operations.

Accelerator Pedal Position (APP) Sensor

The accelerator pedal position (APP) sensor is mounted on the accelerator pedal. The APP detects the position of the accelerator pedal and inputs this information as a voltage to the powertrain control module (PCM). The PCM uses the APP sensor information to aid in determining shift scheduling, electronic pressure control (EPC) and torque converter (TCC) control.

Instrument Panel Range Selector Indicator

This indicator is an electronic readout in the instrument cluster which will match the position of the range selector (P, R, N, D4, D5, 3, 2, 1). If an error in the range selector assembly occurs, an "E" (error) will be displayed on the instrument panel.

Select Shift Transmission (SST) Switches (+ and -)

The positions indicated by a (+) or a (-) allow the driver to manually select the appropriate upshift (+) or downshift (-) and gear range.

The SST switches are located within the transmission range selector assembly and are momentary contact switches that send a signal to the PCM each time the driver moves the selector lever into the upshift or downshift gear range.

The PCM uses the input signals from the SST+ and the SST- switches, along with other vehicle inputs to determine which gear should be commanded.

Preliminary Inspection

Printable View (16 KB)

The following items must be checked prior to beginning the diagnostic procedures:

Know and Understand the Concern

In order to correctly diagnose a concern, first understand the customer concern or condition. Customer contact may be necessary in order to begin to verify the concern. Understand the condition as to when the concern occurs, for example:

- hot or cold vehicle temperature.
- hot or cold ambient temperature.
- vehicle driving conditions.
- vehicle loaded/unloaded.

After understanding when and how the concern occurs, proceed to verify the concern.

Verification of Condition

This section provides information that must be used in both determining the actual cause of customer concerns and executing the appropriate procedures.

The following procedures must be used when verifying customer concerns for the engine.

Determine Customer Concern

NOTE: Some transmission conditions can cause engine concerns. An electronic pressure control short circuit can cause engine misfiring. The torque converter clutch not disengaging will stall the engine.

Determine customer concerns relative to vehicle use and dependent driving conditions, paying attention to the following items:

- Hot or cold vehicle operating temperature
- Hot or cold ambient temperatures
- Type of terrain
- Vehicle loaded/unloaded
- City/highway driving
- Upshift
- Downshift
- Coasting
- Engagement
- Noise/vibration check for dependencies, either rpm dependent, vehicle speed dependent, shift dependent, gear dependent, range dependent or temperature dependent.

Check Fluid Level and Condition

Fluid Level Check

⚠ **CAUTION: The vehicle should not be driven if the fluid level is low or internal failure could result.**

NOTE: If the vehicle has been operated for an extended period of time at highway speeds, in city traffic, in hot weather, or pulling a trailer, the fluid must cool down 30 minutes to obtain an accurate reading.

This vehicle is not equipped with a fluid level indicator. An incorrect level may affect the transmission operation and can result in transmission damage. To correctly check and add fluid to the transmission, refer to Transmission Fluid Level Check in this section.

High Fluid Level

A fluid level that is too high can cause the fluid to become aerated due to the churning action of the rotating internal parts. This will cause erratic control pressure, foaming, loss of fluid from the vent tube and possible transmission damage. If an overfill reading is indicated, refer to Transmission Fluid Level Check in this section.

Low Fluid Level

A low fluid level can result in poor transmission engagement, slipping or damage. It can also indicate a leak in one of the transmission seals or gaskets.

Adding Fluid

⚠ CAUTION: The use of any type of transmission fluid other than specified can result in transmission damage.

If fluid must be added, add fluid in 0.25L (0.5 pint) increments through the fluid pan level check screw opening. Do not overfill the fluid, refer to Transmission Fluid Level Check in this section. For fluid type, refer to the General Specification chart in this section.

Fluid Condition Check

1. Observe the color and the odor of the fluid. Under normal circumstances, the color should be dark reddish, not brown or black.

2. Allow the fluid to drip onto a facial tissue and examine the stain.

3. If evidence of solid material is found, the transmission fluid pan should be removed for further inspection.

4. If fluid contamination or transmission failure is confirmed by the sediment in the bottom of the transmission fluid pan, the transmission must be disassembled and completely cleaned.

5. Carry out diagnostic checks and adjustments. Refer to Diagnosis By Symptom in this section.

Road Testing Vehicle

Printable View (8 KB)

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: When the battery has been disconnected or a new battery installed, certain transmission operating parameters may be lost. The powertrain control module (PCM) must relearn these parameters. During this learning process you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

The Shift Point Road Test and Torque Converter Operation Test provide diagnostic information on transmission shift controls and torque converter operation.

Shift Point Road Test

Printable View (9 KB)

This test verifies that the shift control system is operating correctly.

1. Bring engine and transmission up to normal operating temperature.
2. Operate the vehicle with the selector lever in the D5 position.
3. Apply minimum throttle and observe the speeds at which upshift occurs and torque converter engages. Refer to the following Shift Speeds chart.
4. Stop the vehicle. Select the D4 position. Repeat Step 3. The transmission will make all upshifts except 4-5 and torque converter clutch should apply above 46 km/h (27 mph).
5. Press the accelerator pedal to the floor, wide open throttle (WOT). The transmission should shift from third to second, or third to first, depending on vehicle speed, and torque converter clutch should release.
6. With vehicle speed above 48 km/h (30 mph), move the transmission range selector lever from D4 position to first position and release the accelerator pedal. The transmission should immediately downshift to third gear. When vehicle speed drops below 32 km/h (20 mph), the transmission should downshift into first gear.
7. If transmission fails to upshift/downshift or torque converter clutch does not apply/release, refer to Diagnosis By Symptom for possible causes.

Shift Speeds 3.0L/3.9L Engines

Throttle Position	D5 Position Shift	Shift Speed Axle Ratio
Closed	5-4	35-42 km/h (22-26 mph)
	4-3	6-10 km/h (4-6 mph)
	3-2	6-10 km/h (4-6 mph)
	2-1	10-15 km/h (6-9 mph)
Minimum	1-2	13-16 km/h (8-10 mph)
Monitor PID:	2-3	21-26 km/h (13-16 mph)
TP volt 1.25	3-4	29-35 km/h (18-22 mph)
	4-5	40-45 km/h (25-28 mph)
Wide	1-2	64-74 km/h (40-46 mph)
Open	2-3	93-101 km/h (58-63 mph)
	3-4	140-148 km/h (87-92 mph)
	4-5	195-206 km/h (121-128 mph)

Torque Converter Diagnosis

Printable View (10 KB)

Prior to installing a new torque converter, all diagnostic procedures must be followed. This is to prevent the unnecessary installation of good torque converters. Only after a complete diagnostic evaluation can the decision be made to install a new or remanufactured torque converter.

Begin with the normal diagnostic procedures as follows:

1. Preliminary Inspection.

2. Know and Understand the Customer Concern.

3. Verify the Concern Carry out the Torque Converter Clutch Operation Test; refer to Torque Converter Operation Test in this section.

4. Carry out Diagnostic Procedures.

- Run on-board diagnostics. See On-Board Diagnostics with diagnostic tool. Refer to Diagnostics in this section.
  - ♦ Repair all non-transmission related DTCs first.
  - ♦ Repair all transmission DTCs.
  - ♦ Rerun on-board diagnostics to verify repair.
- Carry out the Line Pressure Test. Refer to Special Testing Procedures in this section.
- Carry out the Stall Speed Test. Refer to Special Testing Procedures in this section.
- Carry out the Diagnosis by Symptom Index. Refer to Diagnosis By Symptom in this section.
  - ♦ Use the index to locate the appropriate routine that best describes the symptom(s). The routine will list all possible components that may cause or contribute to the symptom. Check each component listed, diagnose and service as necessary before servicing the torque converter.

Torque Converter Operation Test

This test verifies that the torque converter clutch control system and the torque converter are operating correctly.

5. Carry out the Quick Test. See On-Board Diagnostics with diagnostic tool. Refer to Diagnostics in this section. Check for DTCs. Refer to the Diagnostic Trouble Code Charts in this section.

6. Connect a tachometer to the engine.

7. Bring the engine to normal operating temperature by driving the vehicle at highway speeds for approximately 15 minutes in (D) position.

8. After normal operating temperature is reached, maintain a constant vehicle speed of about 80 km/h (50 mph) and tap the brake pedal with the left foot.

9. The engine rpm should increase when the brake pedal is tapped, and decrease about 5 seconds after the pedal is released. If this does not occur, refer to Torque Converter Operation Concerns in Diagnosis By Symptom .

10. If the vehicle stalls in (D) or manual 2 at idle with vehicle at a stop, move the transmission range selector lever to manual 1 position. If the vehicle stalls, refer to Diagnosis By Symptom , Torque Converter Operation Concerns in this section. Repair as necessary. If the vehicle does not stall in (D), refer to Diagnosis By Symptom in this section.

Visual Inspection

Printable View (9 KB)

This inspection will identify modifications or additions to the vehicle operating system that may affect diagnosis. Inspect the vehicle for non-Ford factory add-on devices such as:

- Electronic add-on items:
  - ♦ air conditioning.
  - ♦ generator (alternator).
  - ♦ engine turbo.
  - ♦ cellular telephone.
  - ♦ cruise control.
  - ♦ CB radio.
  - ♦ linear booster.
  - ♦ backup alarm signal.
  - ♦ computer.
- Vehicle modification:

These items, if not installed correctly, will affect the powertrain control module (PCM) or transmission function. Pay particular attention to add-on wiring splices in the PCM harness or transmission wiring harness, abnormal tire size, or axle ratio changes.

- Leaks; refer to Leakage Inspection in this section.
- Correct linkage adjustments; refer to Section 307-05 .

Shift Linkage Check

Check for a misadjustment in shift linkage by matching the detents in the transmission range selector lever with those in the transmission. If they match, the misadjustment is in the indicator. Do not adjust the shift linkage.

Hydraulic leakage at the manual control valve can cause delay in engagements and/or slipping while operating if the linkage is not correctly adjusted. Refer to Section 307-05 .

Check TSBs and OASIS

Refer to all Technical Service Bulletins (TSBs) and OASIS messages which pertain to the transmission concern and follow the procedure as outlined.

Carry Out On-Board Diagnostics (KOEO, KOER)

After a road test, with the vehicle warm and before disconnecting any connectors, carry out the Quick Test using a suitable diagnostic scan tool. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the powertrain control system.

Diagnostics

Printable View (51 KB)

Special Tool(s)

ST1300-A	UV Leak Detector 164-R0756 or equivalent
ST1565-A	Pressure Gauge, Transmission Fluid 307-004 (T57L-77820-A)
ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)
ST2538-A	Transmission Test Plate and Gasket 307-433-01, 307-433-02, 307-433-03
ST1137-A	73 III Automotive Meter 105-R0057 or equivalent
ST1761-A	Trans Tester TR/MLP Overlay and Manual 007-00131 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication module (VCM) with appropriate adapters, or equivalent diagnostic tool
ST1632-A	MLP-TR Cable 418-F107 (007-00111) or equivalent
ST1389-A	Transmission Tester 307-F016 (007-00130) or equivalent

Diagnosing electronically controlled automatic transmissions is simplified using the following procedures. It is important to remember that there is a definite procedure to follow. Do not take shortcuts or assume that critical checks or adjustments have already been made. Follow the procedures as written to avoid missing critical components or steps. By following the diagnostic sequence, the technician will be able to diagnose and repair the concern the first time.

On-Board Diagnostics with Diagnostic Tool

NOTE: For detailed instruction and other diagnostic methods using the diagnostic tool, refer to the diagnostic tool tester and the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

These quick tests should be used to diagnose the powertrain control module (PCM) and should be carried out in order.

- Quick Test 1.0 Visual Inspection
- Quick Test 2.0 Set Up
- Quick Test 3.0 Key On, Engine Off
- Quick Test 4.0 Continuous Memory
- Quick Test 5.0 Key On, Engine Running
- Special Test Mode
    - Wiggle Test Mode
    - Output Test Mode
- PCM Reset Mode
- Clearing DTCs
- OBD II Drive Cycle

For further information on other diagnostic testing features using the WDS or generic diagnostic tool, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Output State Control (OSC) Mode

Printable View (25 KB)

Output state control (OSC) allows the technician to take control of certain parameters to function the transmission. For example, OSC allows the technician to shift the transmission only when commanding a gear change. If the technician commands first gear in OSC, the transmission will remain in first gear until the technician commands the next gear. For another example, the technician can command a shift solenoid to turn on or off when carrying out an electrical circuit check. OSC has 2 modes of operation for transmission, the BENCH MODE and the DRIVE MODE. Each mode/parameter has a unique set of vehicle operating requirements that the technician must meet before being allowed to operate OSC.

NOTE: To operate OSC the digital transmission range (TR) sensor and the vehicle speed sensor (VSS) must be operational. No diagnostic trouble codes (DTCs) related to the digital TR sensor or the VSS can be present.

- The vehicle requirements MUST BE MET when SENDING the OSC value. Refer to vehicle requirements for each individual test.
- If the vehicle requirements are NOT MET when SENDING the OSC value, an ERROR MESSAGE will appear. When the ERROR MESSAGE is received, OSC is aborted and must be restarted.
- If after a sent value is substituted and the vehicle requirements are no longer met, the PCM will cancel the OSC value and resume normal operation. No error message will be sent.
- The OSC value XXX may be sent anytime to cancel OSC.

Output State Control (OSC) Procedures

- Carry out visual inspection and vehicle preparation as necessary.
- Select "Vehicle and Engine Selection" menu.
- Select appropriate vehicle and engine.
- Select "Diagnostic Data Link."
- Select "Powertrain Control Module."
- Select "Diagnostic Test Mode."
- Select "KOEO On-Demand Self Test and KOER On-Demand Self Tests."
- Carry out test and record DTCs.
- Repair all NON-Transmission DTCs.
- Repair all VSS and digital TR sensor DTCs.
- Make sure that VSS and digital TR sensors are functional.
- Select "Active Command Modes."
- Select "Output State Control."
- Select "Trans - Bench Mode or Trans - Drive Mode."

OSC Transmission Bench Modes

The following Transmission Bench Modes may be used as necessary during diagnostics.

SSA, SSB, SSC, SSD and TCC in BENCH MODE

⚠ CAUTION: The parking brake must be set prior to carrying out this procedure.

The BENCH MODE allows the technician to carry out electrical circuit checks on the following components:

- SSA - Activates SS A OFF or ON.
- SSB - Activates SS B OFF or ON.
- SSC - Activates SS C OFF or ON.

- SSD - Activates SS D OFF or ON.
- TCC - Activates TCC OFF or ON.

OSC "SSA, SSB, SSC, SSD, TCC" BENCH MODE operates ONLY when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Transmission range selector lever in P or N.
- Key ON.
- Engine OFF.

OSC Command Values

- OFF - turns solenoid OFF.
- ON - turns solenoid ON.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

BENCH MODE Procedure for SSA, SSB, SSC, SSD and TCC

Follow operating instructions from the NGS menu screen:

- Select "Output State Control".
- Select "Trans - Bench Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - SSA, SSB, SSC, SSD or TCC."
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND".

PCA, PCB, PCC in BENCH MODE

⚠ CAUTION: The parking brake must be set prior to carrying out this procedure.

The BENCH MODE is also used to test the functionality of the transmission electronic pressure control. During BENCH MODE, the PCx solenoids can be commanded in increments of 15 psi from 0 to 90 psi and 90 to 0 psi.

The line pressure tap is used to verify output pressure from PC A or PC B by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the PC C solenoid.

The OSC functions for the parameter PCx allows the technician to choose the following options:

- PCx - Activates PCx to selected values.
- 00 - sets PCx pressure to 00 psi.
- 15 - sets PCx pressure to 15 psi.
- 30 - sets PCx pressure to 30 psi.
- 45 - sets PCx pressure to 45 psi.
- 60 - sets PCx pressure to 60 psi.

- 75 - sets PCx pressure to 75 psi.
- 90 - sets PCx pressure to 90 psi.

OSC "PCx" Bench Mode should ONLY be operated to check PRESSURE FUNCTIONALITY using an installed pressure gauge (300 psi) when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Transmission range selector lever in P or N.
- Pressure gauge installed.
- Key ON.
- Engine ON.
- Engine rpm at least 1500.

OSC "PCx" Bench Mode should ONLY be operated to complete PCx SOLENOID CIRCUIT PINPOINT TESTS when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs are present.
- Transmission range selector lever is in "P" or "N".
- Key ON.
- Engine OFF.

OSC Command Values

- 00 - sets PCx pressure to 00 psi.
- 15 - sets PCx pressure to 15 psi.
- 30 - sets PCx pressure to 30 psi.
- 45 - sets PCx pressure to 45 psi.
- 60 - sets PCx pressure to 60 psi.
- 75 - sets PCx pressure to 75 psi.
- 90 - sets PCx pressure to 90 psi.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

BENCH MODE Procedure for PCx

Following operating instructions from the NGS menu screen:

- Select "Output State Control".
- Select "Trans - Bench Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - PCx".
- Select Value "0 - 90 psi".
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND."

OSC Transmission DRIVE MODES

The DRIVE MODE allows control of 3 transmission parameters. Each mode/parameter has a unique set of vehicle operating requirements that the technician must meet before being allowed to operate OSC. The recommended procedure, when using the DRIVE MODE, is to control one parameter at a time.

The DRIVE MODE allows the technician to carry out the following functions on the transmission:

- GEAR - allows upshifts or downshifts.
- TCC - engages or disengages the torque converter clutch.
- FIRM_SFT - Commands a higher control pressure during upshift.

The pressure control (PCx) solenoids for this transmission are not directly controlled during DRIVE MODE testing. Pressures may be raised during an upshift via the harsh shift control channel (FIRM_SFT).

GEAR in DRIVE MODE

This OSC function is used to test the transmission shift functions.

The OSC functions for the GEAR parameter allow the technician to choose the following options:

- 1 - PCM selects 1st gear.
- 2 - PCM selects 2nd gear.
- 3 - PCM selects 3rd gear.
- 4 - PCM selects 4th gear.
- 5 - PCM selects 5th gear.

OSC "GEAR" Mode operates ONLY when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Engine ON.
- TCC OFF (TCC cannot be engaged)
- Transmission range selector lever in (D).
- Vehicle speed is greater than 3 km/h (2 mph).

OSC Command Values

- 1 - PCM selects 1st gear.
- 2 - PCM selects 2nd gear.
- 3 - PCM selects 3rd gear.
- 4 - PCM selects 4th gear.
- 5 - PCM selects 5th gear.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

DRIVE MODE Procedure for GEAR

Follow operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans - DRIVE MODE".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - GEAR".
- Select Value "1-5".
- Press "SEND" to send command.
- Reselect Value "1-5".
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.

- Press "SEND".

TCC in DRIVE MODE

This OSC function is used to test whether the torque converter clutch is engaging and disengaging correctly.

The OSC functions for the TCC parameter allows the technician to choose the following:

- TCC - activates TCC OFF and ON.
- ON - turns TCC solenoid ON.
- OFF - turns TCC solenoid OFF.

OSC "TCC OFF" DRIVE MODE operates ONLY when:

- VSS and digital TR sensors are operational.
- No VSS and digital TR sensor DTCs present.
- Engine ON.
- Transmission range selector lever in (D).
- Vehicle speed is greater than 3 km/h (2 mph).

OSC "TCC ON" DRIVE MODE operates ONLY when:

- VSS and digital TR sensors are operational.
- No VSS and digital TR sensor DTCs present.
- Engine ON.
- Transmission range selector lever in (D).
- Vehicle speed is greater than 3 km/h (2 mph).
- Transmission in 2nd gear or higher.
- TFT is between 33-153°C (60-275°F).
- Brake not applied "OFF" below 32 km/h (20 mph).
- Maintain steady speed.

OSC Command Values

- OFF - turns TCC OFF.
- ON - turns TCC ON.
- XXX - cancels OSC value sent.
- SEND - sends the values to PCM.

Drive Mode Procedures for TCC

Follow operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans-drive Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - TCC".
- Select "ON" to turn solenoid ON.
- Press "SEND" to send command ON.
- Select "OFF" to turn solenoid OFF.
- Press "SEND" to send command OFF.
- Select "XXX" to cancel at any time.
- Press "SEND".

FIRM_SFT in DRIVE MODE

This OSC function is used to raise pressure during an upshift to determine whether the pressure control system is functioning correctly. Harsher shifts indicate that the pressure control system works at higher pressure. The best test for isolating pressure control system problems is to carry out the PCA, PCB, PCC in BENCH MODE using a hydraulic pressure gauge.

The OSC functions for the parameter FIRM_SFT allows the technician to choose the following options:

- FIRM_SFT - activates the harsh shift channel.
  - ♦ ON - sets control pressure higher for all upshifts (determined by the PCM)
  - ♦ OFF - sets control pressure to normal for all upshifts (determined by the PCM)
  - ♦ XXX - cancel OSC for FIRM_SFT

OSC "FIRM_SFT" DRIVE MODE operates ONLY when:

- VSS and digital TR sensor are operational.
- No VSS and digital TR sensor DTCs.
- Transmission range selector lever in O/D.
- Pressure gauge installed (optional).
- Key ON.
- Engine ON.
- Vehicle speed greater than 3 km/h (2 mph).
- TCC is OFF (TCC is not engaged).

OSC Command Values

- ON - sets control pressure high for all upshifts (determined by the PCM)
- OFF - sets control pressure to normal for all upshifts (determined by the PCM)
- XXX - cancel OSC for FIRM_SFT
- SEND - sends the values to the PCM

DRIVE MODE Procedure for FIRM_SFT

Follow operating instructions from the NGS menu screen.

- Select "Output State Control".
- Select "Trans - Drive Mode".
- Select "PIDs" to be monitored.
- Monitor all selected PIDs during test.
- Select "Parameters - FIRM_SFT.
- Press "SEND" to send command.
- Select "XXX" to cancel at any time.
- Press "SEND".

Using Output State Control (OSC) and Accessing PIDs

To confirm that the OSC value was sent by the NGS and the PCM has accepted the OSC substitution, a corresponding PID for each OSC parameter must be monitored. Additional PIDs should be monitored to help the technician adequately diagnose the transmission.

The following is a list of OSC parameters and their corresponding PID:

Corres-ponding PID	PID Description
BPP	Brake Pedal Position Switch On/Off
PCA	Pressure Control Solenoid A Commanded Pressure
PCB	Pressure Control Solenoid B Commanded Pressure
PCC	Pressure Control Solenoid C Commanded Pressure
FIRMST	Firm Shift Control (FMC) status requested by OSC; 0 = FSC not commanded by OSC, NGS PID output = OFF; 1 = FSC commanded by OSC, NGS PID output = ON
GEAR	Commanded Transmission Gear (use in drive only)
RPM	Engine revolutions per minute
SSA	Shift solenoid A commanded ON
SSB	Shift solenoid B commanded ON
SSC	Shift solenoid C commanded ON
SSD	Shift solenoid D commanded ON
TCC	Torque converter commanded duty cycles (%)
TCCRAT	Torque converter speed ratio (RPM and or TSS)
TFT	Transmission fluid temperature (degrees F)
VSS	Vehicle speed (mph)

To confirm that the OSC substitution occurred, SEND the OSC value and monitor the corresponding PID value. If no ERROR MESSAGE was received and the value of the corresponding PID is the same as the value sent from OSC, then the OSC substitution was successful.

Transmission Drive Cycle Test

Printable View (13 KB)

NOTE: Always drive the vehicle in a safe manner according to driving conditions and obey all traffic laws.

NOTE: The Transmission Drive Cycle Test must be followed exactly. Transmission failure must occur 4 times consecutively for shift error diagnostic trouble code (DTC) code to be set, and 5 times consecutively for continuous torque converter clutch (TCC) code to set.

NOTE: When carrying out the Transmission Drive Cycle Test, use the Solenoid Operation Chart for proper solenoid operation. Refer to Pinpoint Tests OSC Equipped Vehicles in this section.

After carrying out the Quick Test, use the Transmission Drive Cycle Test for checking continuous codes.

1. Record and then erase Quick Test codes.
2. Warm engine to normal operating temperature.
3. Make sure transmission fluid level is correct.
4. With transmission in (D) position, moderately accelerate from stop to 80 km/h (50 mph). This allows the transmission to shift into 5th gear. Hold speed and throttle open steady for a minimum of 15 seconds.
5. With transmission in 5th gear and maintaining steady speed and throttle opening, lightly apply and release brake to operate stop lamps. Then hold speed and throttle steady for a minimum of 5 seconds.
6. Brake to a stop and remain stopped for a minimum of 20 seconds.
7. Repeat steps 4 through 6 at least 5 times.
8. Carry out the Quick Test and record continuous DTCs.

After On-Board Diagnostics

NOTE: The vehicle wiring harness, powertrain control module (PCM) and non-transmission sensors may affect transmission operations. Repair these concerns first.

After the on-board diagnostic procedures are completed, repair all DTCs.

Begin with non-transmission related DTCs, then repair any transmission related DTCs. Refer to the Diagnostic Trouble Code Charts in this section for information on condition and symptoms. This chart will be helpful in referring to the correct manual(s) and aids in diagnosing internal transmission concerns and external non-transmission inputs. The pinpoint tests are used in diagnosing transmission electrical concerns. Make sure that the vehicle wiring harness and the PCM are diagnosed as well. The Powertrain Control/Emissions Diagnosis (PC/ED) manual will aid in diagnosing non-transmission electronic components.

Before Pinpoint Tests

NOTE: Prior to entering pinpoint tests, check the powertrain control module (PCM) wiring harness for correct connections, bent or broken pins, corrosion, loose wires, correct routing, correct seals and their condition. Check the PCM, sensors and actuators for damage. Refer to the Powertrain Control/Emissions

Diagnosis (PC/ED) manual.

NOTE: If a concern still exists after electrical diagnosis, refer to Diagnosis By Symptom in this section.

If DTCs appear while carrying out the on-board diagnostics, refer to the Diagnostic Trouble Code Charts in this section for the appropriate repair procedure. Prior to entering pinpoint tests, refer to any TSBs and OASIS messages for transmission concerns.

Diagnostic Trouble Code Charts

Printable View (57 KB)

Diagnostic Trouble Code Chart

**May also be generated by some other non-electric transmission hardware system.					
*Output circuit check, generated only by electrical symptoms.					
Five Digit DTC	**Com-ponent**	**Description**	**Condition**	**Symptom**	**Action**
P0102, P0103, P1100, P1101	MAF	MAF concerns	MAF system inoperative which may cause a transmission concern.	High/low EPC pressure, incorrect shift schedule. Incorrect torque converter clutch engagement scheduling. Symptoms similar to a TP failure.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0112	IAT	IAT indicates 125°C (254°F) (grounded)	Voltage drop across IAT exceeds scale set for temperature 125°C (254°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0113	IAT	IAT indicates -40°C (-40°F) (open circuit)	Voltage drop across IAT exceeds scale set for temperature -40°C (-40°F).	Incorrect EPC pressure. Either high or low which will result in harsh or soft shifts.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0114	IAT	IAT out of on-board diagnostic range	IAT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1116	ECT	ECT out of on-board diagnostic range	ECT temperature higher or lower than expected during KOEO and KOER.	Rerun on-board diagnostic at normal operating temperature.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0117	ECT	ECT indicates 125°C (254°F)	Voltage drop across ECT exceeds scale set for temperature 125°C (254°F) (grounded).	Torque converter clutch will always be off, resulting in reduced fuel economy.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0118	ECT	ECT indicates -40°C (-40°F)	Voltage drop across ECT exceeds scale set for temperature -40°C (-40°F)	Torque converter clutch will always be off, resulting in reduced fuel economy.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

			(open circuit).		
P0121, P0122, P0123, P1120, P1121, P1125, P1124	TP	TP concern	PCM has detected an error. This error may cause a transmission concern.	Harsh engagements, firm shift feel, abnormal shift schedule, torque converter clutch does not engage. Torque converter clutch cycling.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0121-P0124, P0221-P0224, P2100-P2107, P2110-P2112, P2121-P2124, P2126-P2129, P2121-P2135, P2138-P2140	APP	APP concern	PCM has detected an error. This error may cause a transmission concern.	Harsh engagements, firm shift feel, abnormal shift schedule, torque converter clutch does not engage. Torque converter clutch cycling.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0300-P0308, P0320, P0340, P1351-P1364	EI	EI concerns	EI system is inoperative which may cause a transmission concern.	Harsh engagements and shifts, late WOT shifts, no torque converter clutch engagement.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0503, P0500, U1039	ABS	Insufficient VSS input from ABS through SCP link.	PCM detected a loss of vehicle speed signal through SCP link from ABS.	No transmission symptom. IP speedometer may be affected.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0705	Digital TR sensor	Digital TR circuit failure	Digital TR circuits, indicating an invalid pattern in TR_D. Condition caused by a short to ground or an open in TR4, TR3A, TR2 and/or TR1 circuits. This DTC cannot be set by an incorrectly adjusted digital TR sensor.	Harsh engagements, or wrong gear commanded. Defaults to (D) or invalid position. May turn MIL ON.	Go To Pinpoint Test C .
P0708	Digital TR sensor	Digital TR sensor circuit TR3A open	Digital TR sensor circuit TR3A reading 2.6v - 5.0v (open circuit). This	Harsh engagements, or wrong gear commanded. Defaults to (D) or invalid	Go To Pinpoint Test C .

			DTC cannot be set by an incorrectly adjusted digital TR sensor.	position. May turn MIL ON.	
P1702	Digital TR sensor	Digital TR signal intermittent, code P0705, P0708 are set.	See P0705, P0708 conditions.	See P0705, P0708 symptoms. May flash TCIL.	Go To Pinpoint Test C .
P1704	Digital TR sensor	Digital TR not in P or N positions during KOEO/KOER.	Digital TR sensor or shift cable incorrectly adjusted or digital TR circuit failure.	DTC is set.	Go To Pinpoint Test C .
P1705	Digital TR sensor	Digital TR not in PARK or NEUTRAL during KOEO/KOER.	KOEO/KOER not run in PARK or NEUTRAL, or digital TR circuit failure.	DTC is set.	RERUN KOEO/KOER in PARK or NEUTRAL or Go To Pinpoint Test C .
P0712	TFT	157°C (315°F) indicated TFT sensor circuit grounded	Voltage drop across TFT sensor exceeds scale set for temperature of 157°C (315°F).	DTC set. May flash TCIL.	Go To Pinpoint Test B .
P0713	TFT	-40°C (-40°F) indicated TFT sensor circuit open	Voltage drop across TFT sensor exceeds scale set for temperature -40°C (-40°F).	DTC set. May flash TCIL.	Go To Pinpoint Test B .
P1711	TFT	TFT out of on-board diagnostic range	Transmission not at operating temperature during on-board diagnostic.	DTC set vehicle cold or overheated.	Warm or cool vehicle to normal operating temperature. Go To Pinpoint Test B .
P0711	TFT	No change in TFT	PCM has detected no TFT change during operation.	DTC is set. May flash TCIL.	Go To Pinpoint Test B .
P1783	TFT	Transmission overtemp condition indicated	Transmission fluid temperature exceeded 127°C (270°F).	Increase in control pressure. May flash TCIL.	Go To Pinpoint Test B .
P0715	TSS	Insufficient input from turbine shaft speed sensor	PCM detected a loss of TSS signal during operation.	May turn on MIL.	Go To Pinpoint Test E .
P0717	TSS	Turbine shaft speed sensor signal intermittent	PCM has detected an intermittent TSS signal.	May flash TCIL.	Go To Pinpoint Test E .
P0718	TSS	Turbine shaft speed sensor signal noisy	PCM has detected a noisy TSS signal.	May flash TCIL.	Go To Pinpoint Test E .

P0720	OSS	Insufficient input from OSS sensor	PCM detected a loss of OSS signal during operation.	Abnormal shift schedule, harsh shifts. May flash TCIL.	Go To Pinpoint Test E .
P0721	OSS	Output shaft speed sensor signal noisy	PCM has detected an erratic OSS signal.	Abnormal shift schedule, harsh shifts. May flash TCIL.	Go To Pinpoint Test E .
P0722	OSS	Insufficient input from OSS sensor	PCM detected a loss of OSS signal during operation.	Abnormal shift schedule, harsh shifts. May flash TCIL.	Go To Pinpoint Test E .
P0731**	SSA, SSB, SSC or internal parts	1st gear ratio error	No 1st gear.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected. May flash TCIL.	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A .
P0732**	SSA, SSB, SSC or internal parts	2nd gear ratio error	No 2nd gear.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected. May flash TCIL.	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A .
P0733**	SSA, SSB, SSC or internal parts	3rd gear ratio error	No 3rd gear.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected. May flash TCIL.	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A .
P0734**	SSA, SSB, SSC or internal parts	4th gear ratio error	No 4th gear.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction	REFER to the Solenoid On/Off Charts. Go To Pinpoint Test A .

				material). Engine rpm could be higher or lower than expected. May flash TCIL.	
P0735	SSA, SSB, SSC, SSD or internal parts	5th gear ratio error	No 5th gear.	Correct gear ratio not achieved for commanded gear. Shift errors may also be due to other transmission concerns (stuck valves, damaged friction material). Engine rpm could be higher or lower than expected. May flash TCIL.	REFER to the Solenoid On/Off Chart. Go To Pinpoint Test A .
P1744**	TCC	TCC solenoid circuit error or stuck OFF	The PCM picked up an excessive amount of TCC slippage during normal vehicle operation.	TCC slippage/erratic or no torque converter clutch operation. Stuck OFF: harsh shifts or engagements. Engine RPM may be higher than expected. May flash TCIL.	Go To Pinpoint Test A .
P0743*	TCC	TCC solenoid circuit failure during on-board diagnostic	TCC solenoid circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostics.	Open or short to battery power: harsh shifts or engagements, engine rpm higher than expected. Short to ground: vehicle stall when in drive gear at idle, harsh shifts or engagements, of engine rpm lower than expected. May turn on MIL.	Go To Pinpoint Test A .
P1740**	TCC	TCC solenoid inoperative	TCC not commanded. Mechanical failure of the solenoid detected.	Stuck OFF: Harsh shifts or engagements, engine rpm higher than expected. Stuck ON: Vehicle stall when in drive gear at idle, harsh shifts or engagements, engine rpm lower than expected. May turn on MIL.	Go To Pinpoint Test A and Go To Pinpoint Test D .
P0740*	TCC	TCC solenoid circuit failure during on-board	TCC solenoid circuit fails to provide voltage	Open or short to battery power: harsh shifts or	Go To Pinpoint Test A .

		diagnostic	drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostics. May flash TCIL.	engagements, engine rpm higher than expected. Short to ground: Vehicle stall when in drive gear at idle, harsh shifts or engagements, engine rpm lower than expected. May turn on MIL.	
P0962**	PCA	PCA solenoid circuit failure, short to ground	Voltage through PCA solenoid is checked. An error will be noted if tolerance is exceeded.	Short circuit causes minimum PCA pressure (minimum capacity) and limits engine torque (alternate firm). Slips in gear and third gear incorrect. May turn on MIL.	Go To Pinpoint Test D .
P0745	PCA	PCA solenoid or circuit fault	PCA functional fault low pressure.	Incorrect shift pattern indicating mechanical or hydraulic failure of the transmission. May turn on MIL.	Go To Pinpoint Test D .
P0748	PCA	PCA solenoid inoperative	Electrical failure of the solenoid detected.	Possible slip in gear and/or third gear ratio. May turn on MIL.	Go To Pinpoint Test D .
P0960	PCA	PCA solenoid circuit open	Voltage through PCA solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit causes maximum PCA pressure, harsh engagements and shifts. May flash TCIL.	Go To Pinpoint Test D .
P0963	PCA	PCA solenoid short to battery power, short to ground	Voltage through PCA solenoid is checked. An error will be noted if tolerance is exceeded.	Short to power causes maximum PCA pressure, harsh engagements and shifts. Short to ground no 3rd. May flash TCIL.	Go To Pinpoint Test D .
P0966	PCB	PCB solenoid circuit failure, short to ground	Voltage through PCB solenoid is checked. An error will be noted if tolerance is exceeded.	Short circuit to ground no 2nd and 5th gear. May turn on MIL.	Go To Pinpoint Test D .
P0775	PCB	PCB solenoid or circuit fault	PCB functional fault low pressure.	Incorrect shift pattern indicating mechanical or hydraulic failure of the transmission. Will turn on MIL.	Go To Pinpoint Test D .

P0778	PCB	PCB solenoid inoperative	Electrical failure of the solenoid detected.	No 2nd and 5th gear. Will turn on TCIL.	Go To Pinpoint Test D .
P0967	PCB	PCB solenoid intermittent short to battery voltage, short to ground	Voltage through PCB solenoid is checked. An error will be noted if tolerance is exceeded.	Short to battery power: harsh shift and engagements. Short to ground no 2nd and 5th gear. May flash TCIL.	Go To Pinpoint Test D .
P0964	PCB	PCB solenoid circuit open	Voltage through PCB solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit causes maximum PCB pressure, harsh engagements and shifts. May flash TCIL.	Go To Pinpoint Test D .
P0795	PCC	PCC solenoid or circuit fault	PCC functional fault low pressure.	Incorrect shift pattern indicating mechanical or hydraulic failure of the transmission. Will turn on MIL.	Go To Pinpoint Test D .
P0798	PCC	PCC solenoid inoperative	Electrical failure of the solenoid detected.	Incorrect gear ratio in 4th and 5th gear. Will turn on TCIL.	Go To Pinpoint Test D .
P0968	PCC	PCC solenoid circuit open	Voltage through PCC solenoid is checked. Error is noted if tolerance is exceeded.	Open circuit causes maximum PCC pressure, harsh engagements and shifts. May flash TCIL.	Go To Pinpoint Test D .
P0970	PCC	PCC solenoid circuit failure, short to ground	Voltage through PCC solenoid is checked. An error will be noted if tolerance is exceeded.	No 4th and 5th gear. May turn on MIL.	Go To Pinpoint Test D .
P0971	PCC	PCC solenoid intermittent short to power, short to ground	Voltage through PCC solenoid is checked. An error will be noted if tolerance is exceeded.	Short to battery power: harsh shift and engagements. Short to ground no 4th or 5th gears. May flash TCIL.	Go To Pinpoint Test D .
P0750*	SSA	SSA solenoid circuit failure	SSA circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Open or short to battery power: 1st gear ratio incorrect or no gear ratio errors, no 1st gear. Short to ground: no 4th or 5th gear. May turn on MIL.	Go To Pinpoint Test A .
P0753*	SSA	SSA solenoid circuit failure	SSA circuit failed to provide voltage drop across	Open or short to battery power: 1st gear ratio incorrect or	Go To Pinpoint Test A .

			solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	no gear ratio errors, no 1st gear. Short to ground: no 4th or 5th gear. May turn on TCIL.	
P1714	SSA	SSA inoperative	Mechanical failure of the solenoid detected.	Stuck OFF. Open or short to battery power: 1st gear ratio incorrect or no gear ratio errors, no 1st gear. May turn on MIL. Stuck ON. No 4th or 5th gear. May turn on MIL.	Go To Pinpoint Test F .
P0755*	SSB	SSB solenoid circuit failure	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Open or short to battery power: no 3rd gear. Short to ground: no 1st gear. May turn on MIL.	Go To Pinpoint Test A .
P0758*	SSB	SSB solenoid circuit failure	SSB circuit fails to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Open or short to battery power: no 3rd gear. Short to ground: no 1st gear. May turn on MIL. May flash TCIL.	Go To Pinpoint Test A .
P1715	SSB	SSB inoperative	Mechanical failure of the solenoid detected.	Stuck OFF. 3rd gear ratio incorrect. No 3rd gear. Stuck ON, 1st gear ratio incorrect or no 1st gear. May turn on MIL.	Go To Pinpoint Test F .
P0760*	SSC	SSC solenoid circuit failure	SSC circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Open or short to battery power: 2nd and 5th gear ratio incorrect. Short to ground: 1st gear ratio incorrect or no gear ratio errors. May turn on MIL.	Go To Pinpoint Test A .
P0763*	SSC	SSC solenoid circuit failure	SSC circuit failed to provide voltage drop across solenoid. Circuit open or shorted or PCM driver failure during on-board diagnostic.	Open or short to battery power: 2nd and 5th gear ratio incorrect. Short to ground: 1st gear ratio incorrect or no gear ratio errors. May turn on TCIL.	Go To Pinpoint Test A .
P1716	SSC	SSC inoperative			Go To Pinpoint Test F .

			Mechanical failure of the solenoid detected.	Stuck OFF: 2nd and 5th gear ratio incorrect. Stuck ON: 1st gear ratio incorrect or no gear ratio errors. May turn on MIL.	
P0765	SSD	SSD solenoid circuit failure	SSD circuit failed to provide voltage drop across solenoid. Circuit shorted to ground.	Short to ground. No engine braking. May turn on MIL.	Go To Pinpoint Test A .
P0768	SSD	SSD solenoid circuit failure	SSD circuit failed to provide voltage drop across solenoid. Circuit shorted or to ground.	Short to ground. No engine braking in manual gears. May turn on TCIL.	Go To Pinpoint Test A .
P1717	SSD	SSD inoperative	Mechanical failure of the solenoid detected.	Stuck ON: No engine braking. May turn on MIL.	Go To Pinpoint Test F .
P0791	Intermed-iate shaft speed sensor	Intermediate shaft speed sensor signal failure.	PCM has detected a loss of the Intermediate shaft speed sensor signal.	Harsh shifts. May flash TCIL.	Go To Pinpoint Test E .
P0794	Intermed-iate shaft speed sensor	Intermediate shaft speed sensor signal intermittent	PCM has detected an intermittent Intermediate shaft speed sensor signal.	Harsh shifts. May flash TCIL.	Go To Pinpoint Test E .
P1124	TP	TP voltage high/low for on-board diagnostic.	TP was not in the correct position for on-board diagnostic.	Rerun at appropriate throttle position per application.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1460	A/C	A/C clutch cycling pressure switch error	A/C or defrost ON condition may result from A/C clutch being ON during on-board diagnostic.	DTC set during on-board diagnostic rerun with A/C OFF. Failed ON EPC pressure slightly low with A/C OFF.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1636	SSx	SSx ISIG communication error	PCM has detected an error with the ISIG chip.	May turn on MIL.	INSTALL a new PCM.
P1700	TRANS	Transmission indeterminate failure	Internal component failure. Direct one-way clutch failure.	FMEM becomes active engine rpm limited to 4,000 rpms. Failed a neutral condition in 1st, 3rd or 4th gear in automatic mode. Only	If other solenoid DTCs are present, diagnose and repair them first. CLEAR DTCs and drive vehicle. If P1700 returns, disassemble transmission and inspect the direct

				2nd and 5th gear available. Other DTCs that may set P1700: P0745, P1747, P1760, P1714, P1715, P0750, P0755.	one-way clutch. Repair as required. CLEAR DTC. Drive vehicle and verify repair.
P1703	BPP	Brake not actuated during on-board diagnostic KOER	Brake not cycled during KOER.	Failed ON or not connected torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected torque converter clutch will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1703	BPP	BPP switch circuit failed	Brake ON circuit failure during KOEO.	Failed ON or not connected torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected torque converter clutch will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1572	BPP	BPP switch circuit failed.	Brake ON circuit failure during normal operation.	Failed ON or not connected torque converter clutch will not engage at less than 1/3 throttle. Failed OFF or not connected torque converter clutch will not disengage when brake is applied.	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0815	SST +/-	SST +/- Circuit input signal failed	PCM has detected an incorrect voltage SST input.	May not be able to shift in SST manual mode.	REFER to Section 307-05 .
P1501	VSS input	VSS input high during self test	PCM had detected a VSS input signal during KOER Self Test.	Cannot run KOER.	Stop Vehicle. Rerun KOER Self Test. If KOER cannot be carried out, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Rotunda Transmission Tester

The Rotunda Transmission Tester is used to diagnose electronically controlled transmissions and is used in conjunction with the pinpoint tests. The tests should be carried out in order. Installing the Rotunda

Transmission Tester allows separation of the vehicle electronics from transmission electronics. Refer to the Rotunda Transmission Tester manual for these tests.

- Digital Transmission Range (TR) Sensor Testing
- Resistance/Continuity Test
- Switch Test Park/Neutral, Backup Lamp and Optional Circuits

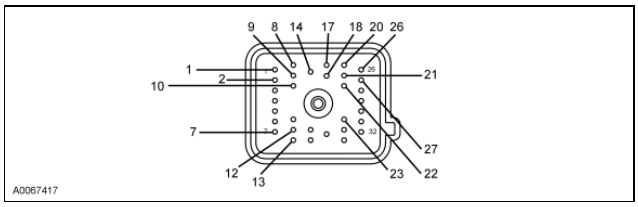
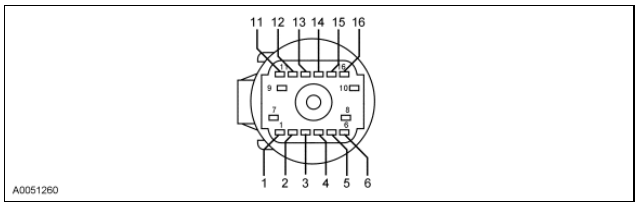
Connector Reference and Terminal Readings

Powertrain Control Module (PCM)



Pin Number	Circuit Description
1	Shift solenoid A (SSA)
2	Shift solenoid B (SSB)
7	Pressure control solenoid A (PC A)
8	Shift solenoid C (SSC)
9	Digital transmission range sensor TR3A to (PCM)
10	Digital transmission range sensor TR4 to (PCM)
12	Pressure control solenoid C (PC C)
13	Pressure control solenoid B (PC B)
14	Signal return
17	Shift solenoid D (SSD)
18	Digital transmission range sensor TR2 to (PCM)
20	Torque converter clutch (TCC) solenoid
21	Intermediate shaft speed sensor signal input
22	Digital transmission range sensor TR1 to (PCM)
23	Transmission fluid temperature (TFT) Sensor
26	Output shaft speed (OSS) sensor signal input
27	Turbine shaft speed (TSS) sensor signal input

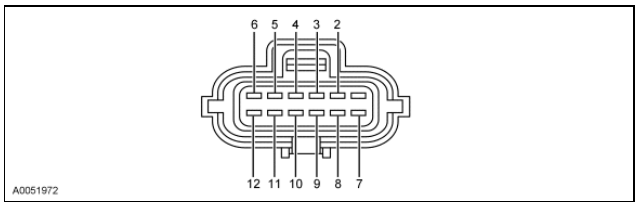
Transmission Vehicle Harness



Pin Number	Circuit Description
1	Pressure control (PCB) solenoid B
2	Transmission fluid temperature (TFT) sensor input

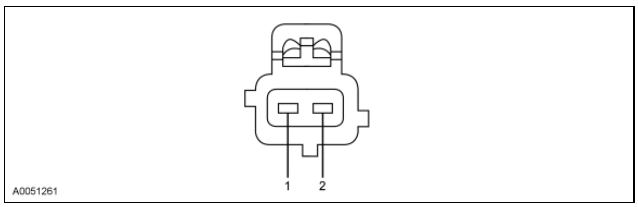
3	Solenoid power
4	Pressure control (PCC) solenoid C
5	Shift solenoid D (SSD)
6	Shift solenoid C (SSC)
11	Pressure control (PCA) solenoid A
12	Signal return
14	Torque converter clutch (TCC) solenoid
15	Shift solenoid B (SSB)
16	Shift solenoid A (SSA)

Digital Transmission Range (TR) Sensor



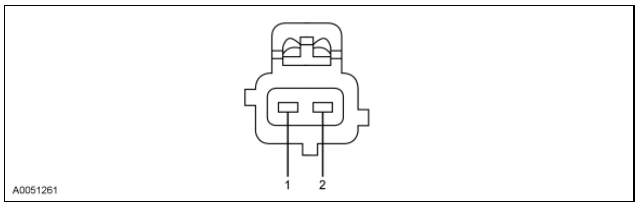
Pin Number	Circuit Description
2	Signal return
3	Digital transmission range (TR) sensor TR3A
4	Digital transmission range (TR) sensor TR1
5	Digital transmission range (TR) sensor TR2
6	Digital transmission range (TR) sensor TR4
7	Ground
8	Neutral switch sense input
9	Fused power feed
10	Starter solenoid central power
11	Reverse lamps
12	Starter relay (overload protected)

Turbine Shaft Speed (TSS) Sensor



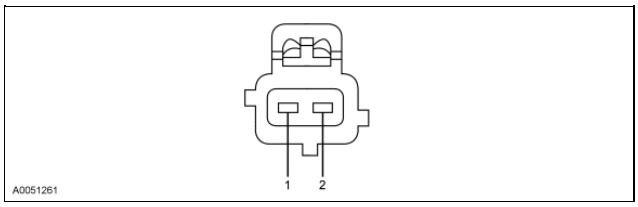
Pin Number	Circuit Description
1	Turbine shaft speed (TSS) sensor signal
2	Signal return

Output Shaft Speed (OSS) Sensor



Pin Number	Circuit Description
1	Output shaft speed (OSS) sensor signal
2	Signal return

Intermediate Shaft Speed Sensor Harness Connector



Pin Number	Circuit Description
1	Intermediate shaft speed sensor signal
2	Signal return

Digital Transmission Range (TR) Sensor Diagnosis Chart

Selector Position	Base Shift Lever Indicator	Select Shift Lever Indicator	PID: TR_D				PID: TR_V (volts)
			TR4	TR3A	TR2	TR1	TR3A (PCM pin 64 to signal return)
Park	P	P	0	0	0	0	0.0 volts
Reverse	R	R	1	1	0	0	1.3 - 1.8 volts
Neutral	N	N	0	1	1	0	1.3 - 1.8 volts
Overdrive	D5/D4	D5	1	1	1	1	1.3 - 1.8 volts
Manual 3	3	D4	1	0	1	0	0.0 volts
Manual 2	2		1	0	0	1	0.0 volts
Manual 1	Man 1		0	0	1	1	0.0 volts

A. TR_V is the voltage at the PCM pin 64 (TR3A Circuit) to signal return.
B. TR_D: 1= Open digital TR switch, 0= Closed digital TR switch.
C. EEC-V Control System Breakout Box Readings: Taken from PCM signal pins for TR1, TR2, TR3A and TR4 to signal return.
- **Voltages for TR1, TR2 and TR4:**
- 0 = 0.0 volts.
- 1 = 9.0 - 14.0 volts.
- **Voltage for TR3A:**

- 0 = 0.0 volts.
- 1 = 1.3 - 1.8 volts.

Wiggle Test Information for Open/Shorts

A. TR4, TR3A, TR2 and TR1 are all closed in PARK. PARK is a good position to check for intermittent open circuits (with scan tool monitoring TR_D).

B. TR4, TR3A, TR2 and TR1 are all open in OVERDRIVE, so OVERDRIVE is a good position to check for shorts to ground. To determine the shorted components while observing TR_D, unplug the TR and see if the short goes away. If the short is still present, unplug the transmission harness and see if the short goes away. If the short is still present, then the short is in the PCM or vehicle harness. Remove the suspect circuit(s) wire terminal from the PCM connector. If the short is still present, then the PCM has an internal failure; otherwise the failure is in the vehicle harness.

Shift Solenoid Pre-Diagnosis

Any time an electrical connector or solenoid body is disconnected, inspect the connector for terminal condition, corrosion and contamination. Also inspect the connector seal for damage. Clean, repair or install new as necessary.

Use the following shift solenoid operation information when carrying out Pinpoint Test A.

Solenoid Operation Chart

Base Gearshift Selector Position	PCM Comm- anded Gear	5R55S Solenoid States

Pinpoint Tests

PINPOINT TEST A: SHIFT AND TORQUE CONVERTER CLUTCH SOLENOIDS

NOTE: Refer to the Transmission Vehicle Harness Connector illustration preceding these pinpoint tests.

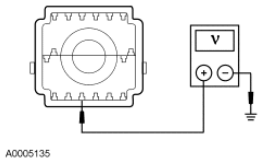
NOTE: Read and record all DTCs. All digital TR sensor and VSS DTCs must be repaired before entering output state control (OSC).

Test Step	Result / Action to Take
A1 ELECTRONIC DIAGNOSTICS	
• Key in OFF position. • Select PARK. • Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Diagnostic Data Link. • Enter the following diagnostic mode on the diagnostic tool: PCM. • Enter the following diagnostic mode on the diagnostic tool: Active Command Modes. • Enter the following diagnostic mode on the diagnostic tool: Output State Control (OSC). • Enter the following diagnostic mode on the diagnostic tool: Trans-Bench Mode. • **Does vehicle enter Trans-Bench Mode?**	**Yes** REMAIN in Trans-Bench Mode. GO to A2 . **No** REPEAT procedure to enter Trans-Bench Mode. If vehicle did not enter Trans-Bench Mode, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.
A2 WIGGLE TEST	
• Remain in Trans-Bench Mode. • Select PIDs to be monitored. **PID Command** | **PID Actual**	**Yes** REPAIR the circuit. TEST the system for normal operation. **No** GO to A3 .

SSA	SSA
SSB	SSB
SSC	SSC
SSD	SSD
TCC	TCC

- Select "ON" to turn suspect solenoid(s) on.
- Press "SEND."
- Wiggle all wiring and connectors to the transmission. Monitor the solenoid state for changes.
- Select "OFF" to turn solenoid(s) off.
- Press "SEND."
- Repeat steps for each solenoid.
- **Does the suspect solenoid(s) state change?**

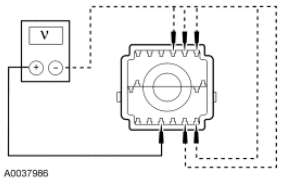
A3 SOLENOID FUNCTIONAL CHECK	
• Monitor each solenoid state. • Turn each solenoid ON and OFF. • **Does the solenoid turn ON and OFF when commanded and can solenoid activation be heard?**	**Yes** GO to A4 . **No** GO to A5 .
A4 OSC TRANS-DRIVE MODE (GEAR OR TCC)	
• Carry out OSC Trans-Drive Mode. • Select GEAR for shift solenoids or follow procedures for GEAR as listed in this section. • Select TCC for torque converter clutch solenoid. Follow procedures of TCC in Drive Mode as listed in this section. • **Does the transmission upshift and downshift or torque converter engage/disengage when commanded?**	**Yes** CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis By Symptom to diagnose shift or torque converter concern. **No** GO to A5 .
A5 CHECK FOR BATTERY VOLTAGE	
• Disconnect: Transmission Vehicle Harness Connector. • Visually inspect all wires and connectors for damage. • Key in ON position. • Measure the voltage on pin 3 harness side and ground.	**Yes** GO to A6 . **No** REPAIR the circuit. TEST for normal operation.



- **Is the voltage greater than 10 volts?**

A6 ELECTRICAL SIGNAL CHECK

- Leave positive lead connected to pin 3 and connect negative lead to pin 5, 6, 14, 15 and 16.



- Enter the following diagnostic mode on the diagnostic tool: Trans-Bench Mode.
- Select parameter SSA, SSB, SSC, SSD or TCC.
- Select "ON."
- Press "SEND."
- Measure the voltage while cycling the solenoids ON and OFF.
- Select "OFF," press "SEND."
- **Does the voltage change?**

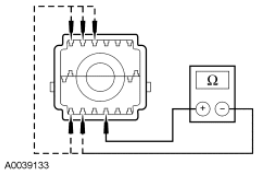
Yes
GO to A7 .

No
REPAIR the circuit. TEST the system for normal operation.

A7 CHECK SOLENOID RESISTANCE AT SOLENOID

- Measure resistance between pin 3 and pin 5, 6, 14, 15 and 16 solenoid side.

Solenoid	Resistance (ohms)
SSA	16-45
SSB	16-45
SSC	16-45
SSD	16-45
TCC	9-16



- **Is the resistance within specification?**

Yes
GO to A8 .

No
INSTALL a new solenoid body assembly. TEST the system for normal operation.

A8 CHECK SOLENOID FOR SHORT TO GROUND	
• Measure resistance between pin 3 and pin 5, 6, 14, 15 and 16 solenoid side and ground.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new solenoid body assembly. **No** REFER to Diagnosis By Symptom in this section for diagnosis of shift or torque converter concerns.

PINPOINT TEST B: TRANSMISSION FLUID TEMPERATURE (TFT) SENSOR

NOTE: Refer to the Transmission Vehicle Harness Connector illustration preceding these pinpoint tests.

Test Step	Result / Action to Take
B1 ELECTRONIC DIAGNOSTICS	
• Key in OFF position. • Select PARK. • Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding. • Connect the diagnostic tool. • Key in ON position. • Select Diagnostic Data Link. • Select PCM. • Select PID/Data Monitor and Record. • Enter the following diagnostic mode on the diagnostic tool: PIDs; TFT, TFTV. • **Does the vehicle enter PID/Data Monitor and Record?**	**Yes** REMAIN in PID/Data Control. GO to B2 . **No** REPEAT procedure to enter PID. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM and NGS.
B2 WARM-UP/COOL-DOWN CYCLE	
• While monitoring the TFT PIDs, carry out the following test: If transmission is cold, run transmission to warm it up. If transmission is warm, allow transmission to cool down. • **Do the TFT PIDs increase as the transmission is warmed up or decrease as the transmission is cooled or does the TFT or TFTV drop in and out of range?**	**Yes** If the TFT PIDs increase as the transmission is warmed or decrease as the transmission is cooled, CLEAR all DTCs. ROAD TEST to verify if concern is still present. If concern is still present, REFER to Diagnosis By Symptom in this section to diagnose transmission overheating. If the TFT or TFTV drop in and out of range, INSPECT for intermittent concern in the internal/external harness, sensor or connector.

	No GO to B3 .
B3 ELECTRICAL SIGNAL CHECK	
• Disconnect: Transmission Harness Connector. • Visually inspect all wires and connectors for damage. • Measure voltage between pin 2 harness side and ground.  A0005138 • **Is the voltage between 4.5 and 5.0 volts?**	**Yes** GO to B4 . **No** REPAIR the circuit. TEST the system for normal operation.
B4 CHECK RESISTANCE OF TFT SENSOR	
• Measure resistance between pin 2 and 12 at solenoid body connector.  A0061762 • Record the resistance. • Resistance should be approximately in the following ranges: Transmission Fluid Temperature **°C** / **°F** / **Resistance (Ohms)** -40 to -20 / -40 to -4 / 967 K - 284 K -19 to -1 / -3 - 31 / 284 K - 100 K 0 - 20 / 32 - 68 / 100 K - 37 K 21 - 40 / 69 - 104 / 37 K - 16 K 41 - 70 / 105 - 158 / 16 K - 5 K 71 - 90 / 159 - 194 / 5 K - 2.7 K 91 - 110 / 195 - 230 / 2.7 K - 1.5 K 111 - 130 / 231 - 266 / 1.5 K - 0.8 K 131 - 150 / 267 - 302 / 0.8 K - 0.54 K • **Is the resistance in the range?**	**Yes** REFER to Diagnosis By Symptom in this section to diagnose an overheating concern. **No** INSTALL a new solenoid body assembly.

PINPOINT TEST C: DIGITAL TRANSMISSION RANGE (TR) SENSOR

NOTE: Refer to the Digital Transmission Range (TR) Sensor Connector illustration and Digital Transmission Range (TR) Sensor Diagnosis Chart preceding these pinpoint tests.

Test Step	Result / Action to Take
C1 VERIFY DIAGNOSTIC TROUBLE CODES	
• Key in OFF position. • Select PARK. • Carry out on-board diagnostic test. • **Are only DTC codes P0705, P0708 present?**	**Yes** GO to C4 . **No** GO to C2 .
C2 VERIFY DIGITAL TRANSMISSION RANGE SENSOR ALIGNMENT	
• Key in OFF position. • Select PARK. • Check to make sure the digital TR sensor harness connector is fully seated, terminals are fully engaged in connector and in good condition before proceeding. • Apply the parking brake. • Select NEUTRAL. • Disconnect the shift cable/linkage from the manual lever. • Verify that the TR Sensor Alignment Gauge fits in the appropriate slots. • **Is the digital TR sensor correctly adjusted?**	**Yes** GO to C3 . **No** ADJUST the digital TR sensor; REFER to Digital Transmission Range (TR) Sensor in this section. PLACE transmission range selector lever into PARK and CLEAR DTCs. RERUN OBD Tests. GO to C3 .
C3 VERIFY SHIFT CABLE/LINKAGE ADJUSTMENT	
• Place the range selector in D5. • Connect the shift cable/linkage. • Verify that the shift cable/linkage is correctly adjusted. REFER to Section 307-05 . • **Is the shift cable/linkage correctly adjusted?**	**Yes** GO to C4 . **No** ADJUST the shift cable/linkage. REFER to Section 307-05 .GO to C4 .
C4 CHECK ELECTRICAL SIGNAL OPERATION	
• Select PARK. • Disconnect: Digital TR Sensor. • ⚠ **CAUTION: Do not pry on connector. This will damage the connector and result in a transmission concern.** • Inspect both ends of the connector for damage or pushed out pins, corrosion, loose wires and missing or damaged seals. • **Is there damage to the connector, pins or harness?**	**Yes** REPAIR as necessary. CLEAR DTCs and RERUN OBD Tests. **No** If diagnosing a DTC, GO to C5 . If diagnosing a starting concern or a backup lamp concern, GO to C10 .
C5 CHECK ELECTRICAL SYSTEM OPERATION (DIGITAL TR AND PCM)	
• Key in OFF position. • Connect the diagnostic tool. • Connect: Digital TR Sensor. • Key in ON position.	**Yes** The problem is not in the digital TR sensor system. REFER to Diagnosis By Symptom in this section for further diagnosis.

• Enter the following diagnostic mode on the diagnostic tool: TR PIDS TR_D, TR_V. • Move transmission range selector lever into each gear and stop. • Observe the PIDs, TR_D, and TR_V (vehicle-dependent) while wiggling harness, tapping on sensor or driving the vehicle. Use PIDs TR_D for DTCs P0705, P1704 and P1705. Use PIDs TR_V for DTC P0708. • Compare the PIDs to the Digital Transmission Range (TR) Sensor Diagnosis Chart. • **Do the PIDs TR_D and TR_V match the Digital Transmission Range (TR) Sensor Diagnosis chart, and does the TR_D PID remain steady when the harness is wiggled, the sensor is tapped on, or the vehicle driven?**	**No** If TR_D changes when wiggling harness, tapping on the sensor or driving the vehicle, the problem may be intermittent. GO to C6 .
C6 CHECK DIGITAL TRANSMISSION RANGE SENSOR OPERATION	
• Disconnect: Digital TR Sensor. • Connect: TR-E Cable to Transmission Tester. • Connect: TR-E Cable to Digital TR Sensor. • Place the DIGITAL TR Overlay onto Transmission Tester. • Carry out SENSOR Test as instructed on the digital TR Overlay. • **Does the status lamp on the tester TRS-E cable match the selected gear positions?**	**Yes** Concern is not in the digital TR sensor. GO to C7 . **No** INSTALL a new digital TR sensor and ADJUST. REFER to Digital Transmission Range (TR) Sensor in this section. CLEAR DTCs and RERUN OBD Tests.
C7 CHECK PCM HARNESS CIRCUITS FOR OPENS	
• Key in OFF position. • Disconnect: 150 Pin PTEC Module Connector "B". • Inspect for damaged or pushed out pins, corrosion or loose wires. • Disconnect: Digital TR Sensor. • ⚠ **CAUTION: Do not pry the connector. This will damage the connector and result in a transmission concern.** • Measure resistance between TR pin 2 harness side and signal return PCM pin 14 harness side.  • Measure resistance between PCM pin 22 and TR pin 4 harness side.	**Yes** GO to C8 . **No** REPAIR the circuits. TEST the system for normal operation.

 A0003752 • Measure resistance between PCM pin 18 and TR pin 5 harness side.  A0005029 • Measure resistance between PCM pin 10 and TR pin 6 harness side.  A0005030 • Measure resistance between PCM pin 9 and TR pin 3 harness side.  A0005031 • **Are the resistances less than 5 ohms?**	
C8 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND OR POWER	
• Measure resistance between PCM pin 14 and TR pins 10 and 12 harness side and ground.  A0083688 • Measure resistance between pin 22 harness side and ground; and pin 14 harness side and ground.	**Yes** GO to C9 . **No** REPAIR the circuits. TEST the system for normal operation. CLEAR DTCs. RERUN OBD Tests.

 A0083701 • Measure resistance between pin 18 harness side and ground; and pin 14 harness side and ground.  A0083702 • Measure resistance between pin 10 harness side and ground; and pin 14 harness side and ground.  A0083703 • Measure resistance between pin 9 harness side and ground; and pin 14 harness side and ground.  A0083704 • **Are the resistances greater than 10,000 ohms?**	
C9 CHECK FOR SHORT BETWEEN TR/PCM INPUT SIGNAL CIRCUITS	
• Measure resistance between pin 9 harness side and pin 22, pin 18 and pin 10 harness side.  A0036188 • Measure resistance between pin 22 harness side; and between pin 9, pin 18 and pin 10 harness side.	**Yes** INSTALL a new PCM. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

 A0005032 • Measure resistance between pin 18 harness side; and between pin 22, pin 9 and pin 10 harness side.  A0005033 • Measure resistance between pin 10 harness side; and between pin 22, pin 18 and pin 9 harness side.  A0005034 • **Are the resistances greater than 10,000 ohms?**	
C10 CHECK THE NON-PCM INTERNAL CIRCUITS OF SENSOR	
• Connect: TRS-E Cable to Transmission. • Connect: TRS-E Cable to Digital TR Sensor. • Place the Digital TR Overlay onto Transmission Tester. • Carry out Switch Test as instructed on the digital TR Overlay. • **Does the status lamp on the tester indicate RED for the correct gear position?**	**Yes** Concern is not in the digital TR sensor. For backup lamp concerns, REFER to Section 417-01 . **No** INSTALL a new digital TR sensor and ADJUST; REFER to Digital Transmission Range (TR) Sensor in this section. CLEAR DTCs and RERUN OBD Tests.

PINPOINT TEST D: PRESSURE CONTROL (PC) SOLENOIDS (PCA, PCB, PCC)

NOTE: Refer to the Transmission Vehicle Harness Connector illustration preceding these pinpoint tests.

NOTE: Read and record all DTCs. All digital TR sensor and VSS DTCs must be repaired before entering output state control (OSC).

Test Step	Result / Action to Take
D1 ELECTRONIC DIAGNOSTICS	
• Key in OFF position. • Select PARK.	**Yes** REMAIN in Trans-Bench Mode. GO to D2 .

• Check to make sure the transmission harness connector is fully seated, terminals are fully engaged in the connector and in good condition before proceeding. • Install 300 psi pressure gauges into line and PC C tap. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Diagnostic Data Link. • Enter the following diagnostic mode on the diagnostic tool: PCM. • Enter the following diagnostic mode on the diagnostic tool: Active Command Modes. • Enter the following diagnostic mode on the diagnostic tool: Output State Control (OSC). • Enter the following diagnostic mode on the diagnostic tool: Trans-Bench Mode. • **Does the vehicle enter the Trans-Bench Mode?**	**No** REPEAT procedure to enter Trans-Bench Mode. If vehicle did not enter OSC, REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.
D2 SOLENOID FUNCTIONAL TEST	
• Monitor pressure gauges. • Enter the following diagnostic mode on the diagnostic tool: Parameter; PCx. • **NOTE:** Make sure that the solenoids not being tested are off or at zero. • Select PC A, PC B or PC C. • Select value - 15, 30, 45, 60, 70 or 90 psi. • Press "SEND." • Select another value "0-90 psi." • Press "SEND." • Enter the following diagnostic mode on the diagnostic tool: XXX. • Press "SEND." • **For PC A and PC B: Does the pressure reading for A or B follow the commanded pressure (actual A and B pressures will be higher than the commanded pressure)? For PC C: Does the pressure reading match the commanded pressure?**	**Yes** CLEAR DTCs. **No** GO to D3 .
D3 CHECK FOR BATTERY VOLTAGE	
• Disconnect: Transmission Harness Connector. • Visually inspect all wires and connectors for damage. • Key in ON position. • Measure voltage between pin 3 harness side and ground.	**Yes** GO to D4 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0005135 • **Is the voltage greater than 10 volts?**	
D4 ELECTRICAL SIGNAL CHECK	
• Leave positive lead connected to pin 3 and connect negative lead to pins 1, 4 and 11 harness side.  A0035164 • Activate solenoids (ON and OFF) while monitoring the voltage reading. • Enter the following diagnostic mode on the diagnostic tool: Trans-Bench Mode. • Enter the following diagnostic mode on the diagnostic tool: Parameter; PCx. • Select a value "0-90 psi." • Press "SEND." • Select another value "0-90 psi." • Press "SEND." • Enter the following diagnostic mode on the diagnostic tool: XXX. • Press "SEND." • **Does the voltage and solenoid state change?**	**Yes** GO to D5 . **No** CHECK for open or short circuit in harness or PCM.
D5 CHECK SOLENOID RESISTANCE AT SOLENOID	
• Measure and record resistance between PC solenoid pin 3 and pins 1, 4 and 11. Resistance should be between 3.3 and 7.5 ohms.  A0005068 • **Is the resistance within specifications?**	**Yes** GO to D6 . **No** INSTALL a new solenoid body assembly.
D6 CHECK SOLENOID FOR SHORT TO GROUND	
• Measure and record resistance between PC solenoid pins 1, 4, 11 and ground solenoid side.	**Yes** INSTALL a new solenoid body assembly. TEST the system for normal operation. **No** REFER to Diagnosis By Symptom in this

 A0037992 • **Is the resistance less than 10,000 ohms?**	section for diagnosis of pressure concerns. TEST the system for normal operation.

PINPOINT TEST E: TURBINE SHAFT SPEED (TSS), INTERMEDIATE SHAFT SPEED AND OUTPUT SHAFT SPEED (OSS) SENSORS

NOTE: Refer to the Turbine Shaft Speed (TSS), Intermediate Shaft Speed and Output Shaft Speed (OSS) Sensor Connector illustrations preceding these pinpoint tests.

Test Step	Result / Action to Take
E1 ELECTRONIC DIAGNOSTICS	
• Check to make sure the transmission harness connectors are fully seated, terminals are fully engaged in connector and in good condition before proceeding. • Connect the diagnostic tool. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Diagnostic Data Link. • Enter the following diagnostic mode on the diagnostic tool: PCM. • Select PID/Data Monitor and Record. • Select the following PIDs: TSS, intermediate shaft speed or OSS. • **Does vehicle enter PID/Data Monitor and Record?**	**Yes** REMAIN in PID/Data. GO to E2 . **No** REPEAT procedure to ENTER PID. If vehicle did not enter PID, REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis of PCM or NGS.
E2 DRIVE CYCLE TEST	
• While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears. • **Does the TSS, intermediate shaft speed or OSS speed PID increase and decrease with engine and vehicle speed?**	**Yes** GO to E3 . **No** If the TSS, intermediate shaft speed or OSS speed PID does not increase and decrease with engine and vehicle speed, INSPECT for open or short in vehicle harness, sensor, a PCM concern, or internal hardware concern. GO to E4 .
E3 DRIVE CYCLE TEST ERRATIC	
• While monitoring the appropriate sensor PID, drive the vehicle so that the transmission upshifts and downshifts through all gears. • **Is the TSS, intermediate shaft speed or OSS speed PID signal erratic (drop to zero or near zero and return to**	**Yes** If the sensor signal is erratic, INSPECT for intermittent concern in the harness, sensor, or connector. GO to E4 . **No** CLEAR all DTCs. RERUN OBD.

normal operation)?	
E4 CHECK PCM HARNESS CIRCUITS FOR OPENS	
• Key in OFF position. • Disconnect: 150 Pin PTEC Module Connector "B". • Inspect for damaged or pushed out pins, corrosion or loose wires. • For OSS, measure resistance between pin 14 and the appropriate sensor connector pin 2 harness side.  A0067424 • For intermediate shaft speed, measure resistance between pin 14 and the appropriate sensor connector pin 2 harness side.  A0067425 • For TSS, measure resistance between pin 14 and appropriate sensor connector pin 2 harness side.  A0067424 • For intermediate shaft speed, measure resistance between pin 21 and appropriate sensor connector pin 1 harness side.  A0009271 • For TSS, measure resistance between	**Yes** GO to E5 . **No** REPAIR the circuit. TEST the system for normal operation.

pin 27 and appropriate sensor connector pin 1 harness side.  A0005141 • For OSS, measure resistance between pin 26 and appropriate sensor connector pin 1 harness side.  A0005035 • **Are all resistances less than 5 ohms?**	
E5 CHECK PCM HARNESS CIRCUITS FOR SHORT TO GROUND	
• For OSS, measure resistance between pin 26 and sensor connector pin 1 harness side and ground.  A0030976 • For intermediate shaft speed, measure resistance between PCM pin 21 and sensor connector pin 1 harness side and ground.  A0030974 • For TSS, measure resistance between PCM pin 27 and sensor connector pin 1 harness side and ground.	**Yes** GO to E6 . **No** REPAIR the circuits. TEST the system for normal operation. CLEAR DTCs. RERUN OBD Tests.

 A0030975 • **Are the resistances greater than 10,000 ohms?**	
E6 CHECK RESISTANCE OF TSS, INTERMEDIATE SHAFT SPEED or OSS SENSOR	
• Disconnect the appropriate vehicle harness connector from the TSS, intermediate shaft speed or OSS sensor. • Connect ohmmeter negative lead to one pin of the sensor and the positive lead to the other pin on the sensor.  A0005211 • Record the resistance. Resistance should be as follows: **Resistance** / **Temperature** 266-390 ohms / -20°C (4°F) 325-485 ohms / 21°C (70°F) 492-738 ohms / 150°C (302°F) • **Is the resistance within specification for the appropriate sensor?**	**Yes** GO to E7 . **No** INSTALL a new sensor.
E7 CHECK SENSORS FOR SHORT TO GROUND	
• Measure resistance between pin 1 and 2 of each sensor and ground.  A0005501 • **Is the resistance less than 10,000 ohms?**	**Yes** INSTALL a new sensor. **No** REFER to Diagnosis By Symptom for diagnosis of shift or torque converter concerns in this section.

PINPOINT TEST F: SOLENOID MECHANICAL FAILURE

NOTE: Repair all other DTCs before repairing the following DTCs: P1714, P1715, P1716, P1717 and P1740.

Test Step	Result / Action to Take
F1 ELECTRONIC DIAGNOSIS	
• Connect the diagnostic tool. • Select PARK. • Key in ON position. • Carry out KOEO test until continuous DTCs have been displayed. • If any of the following DTCs are present, continue with this test: P1714, P1715, P1716, P1717 and P1740. • **Are other DTCs present for TFT or shift solenoids?**	**Yes** REPAIR the DTCs for TFT or shift solenoids first. CLEAR DTCs and CARRY OUT transmission Drive Cycle Test. RERUN Quick Test. **No** INSTALL a new solenoid and/or body. REFER to the Diagnostic Trouble Code Charts for code description. GO to F2 .
F2 TRANSMISSION DRIVE CYCLE TEST	
• Carry out transmission drive cycle test. Refer to Transmission Drive Cycle Test in this section. • **Does the vehicle upshift and downshift OK?**	**Yes** GO to F3 . **No** REFER to Diagnosis By Symptom in this section to diagnose shift concerns.
F3 RETRIEVE DTCS	
• Connect the diagnostic tool. • Select PARK. • Key in ON position. • Carry out KOEO test until continuous DTCs have been displayed. • **Are DTCs P1714, P1715, P1716, P1717 and P1740 still present?**	**Yes** INSTALL a new PCM. ROAD TEST and RERUN Quick Test. **No** Testing completed. If a concern still exists, REFER to Diagnosis By Symptom in this section for concern diagnosis.

Special Testing Procedures

Printable View (94 KB)

Special Tool(s)

ST2408-A	Air Test Plate, Transmission 307-405
ST1565-A	Transmission Fluid Pressure Gauge 307-004 (T57L-77820-A)

The special tests are designed to aid the technician in diagnosing the hydraulic and mechanical portion of the transmission.

Engine Idle Speed Check

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the engine idle speed.

Line Pressure Test

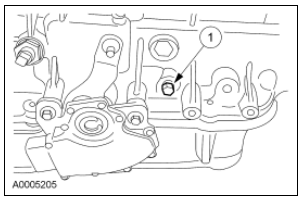
⚠ CAUTION: Carry out Line Pressure Test prior to carrying out Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur. Do not maintain wide open throttle (WOT) in any gear range for more than five seconds.

NOTE: Certain sensor failures may cause high PC, FMEM (Failure Mode Effect Management) actions. Be sure that self test and electrical repairs have been carried out, or test results may be incorrect.

NOTE: The line pressure tap is used to verify output pressure from PC A or PC B by turning either one off while verifying the output from the other solenoid. The second pressure tap is used to verify the output from the PC C solenoid.

This test verifies that the line pressure is within specifications.

1. Connect pressure gauge to the line pressure tap.



Item	Part Number	Description
1		Line Pressure Tap

2. Start engine and check line pressures. Refer to the following Line Pressure Chart to determine if line pressure is within specifications.

Line Pressure Chart 3.0L Engine

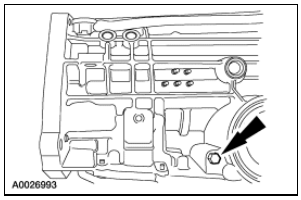
Range	Idle Pressure		WOT Stall Pressure	
	PC C	Line	PC C	Line
P/N	0-69 kPa (0-10 psi)	758-827 kPa (110-120 psi)	0-69 kPa (0-10 psi)	758-827 kPa (110-120 psi)
R	345-414 kPa (50-60 psi)	896-965 kPa (130-140 psi)	2,151-2,289 kPa (312-332 psi)	2,172-2,310 kPa (315-335 psi)
D5	0-69 kPa (0-10 psi)	827-896 kPa (120-130 psi)	0-69 kPa (0-10 psi)	1,517-1,586 kPa (220-230 psi)
D4	0-69 kPa (0-10 psi)	827-896 kPa (120-130 psi)	0-69 kPa (0-10 psi)	1,551-1,620 kPa (225-235 psi)
M5/M4	0-69 kPa (0-10 psi)	827-896 kPa (120-130 psi)	0-69 kPa (0-10 psi)	1,551-1,620 kPa (225-235 psi)
M3	0-69 kPa (0-10 psi)	827-896 kPa (120-130 psi)	0-69 kPa (0-10 psi)	1,551-1,620 kPa (225-235 psi)
M2/M1	0-69 kPa (0-10 psi)	827-896 kPa (120-130 psi)	0-69 kPa (0-10 psi)	1,551-1,620 kPa (225-235 psi)

Line Pressure Chart 3.9L Engine

Range	Idle Pressure		WOT Stall Pressure	
	PC C	Line	PC C	Line
P/N	0-69 kPa (0-10 psi)	483-620 kPa (70-90 psi)	0-69 kPa (0-10 psi)	483-620 kPa (70-90 psi)
R	345-414 kPa (50-60 psi)	689-827 kPa (100-120 psi)	2,151-2,289 kPa (312-332 psi)	2,151-2,289 kPa (312-332 psi)
D5	0-69 kPa (0-10 psi)	689-827 kPa (100-120 psi)	0-69 kPa (0-10 psi)	1,482-1,620 kPa (215-235 psi)
D4	0-69 kPa (0-10 psi)	689-827 kPa (100-120 psi)	0-69 kPa (0-10 psi)	1,482-1,620 kPa (215-235 psi)
M5/M4	0-69 kPa (0-10 psi)	689-827 kPa (100-120 psi)	0-69 kPa (0-10 psi)	1,482-1,620 kPa (215-235 psi)
M3	0-69 kPa (0-10 psi)	689-827 kPa (100-120 psi)	0-69 kPa (0-10 psi)	1,482-1,620 kPa (215-235 psi)
M2/M1	0-69 kPa (0-10 psi)	689-827 kPa (100-120 psi)	0-69 kPa (0-10 psi)	1,482-1,620 kPa (215-235 psi)

3. If line pressure is not within specifications, check PC C pressure.

4. Connect Pressure Gauge to PC C pressure tap.



Item	Part Number	Description
1		Pressure Control (PC C) Tap

5. Start engine and check PC C pressure. Refer to Line Pressure Diagnosis Chart in this section for specification.

6. If PC C pressure is not within specification, Go To Pinpoint Test D to diagnose PC C operation. If PC C operation is OK, refer to Line Pressure Diagnosis Chart in this section for line pressure concern causes.

   Line Pressure Diagnosis Chart

Test Results	Possible Source
High at Idle All Ranges	• Wiring Harnesses • PC C Boost Valve • PC C Solenoid • Main Regulator Valve
Low at Idle All Ranges	• Low Fluid Level • Fluid Inlet Filter/Seal • Main Control Body • Cross Leaks • Gaskets • Pump • Separator Plate
Low All Forward Ranges	• Forward Clutch • Main Control • Overdrive Servo • Intermediate Servo
Low in Park Only	• Valve Body
Low in Reverse Only	• Separator Plate • Rear Servo Piston, Cover Seal • Reverse Clutch • Overdrive Servo • Intermediate Servo • Valve Body • Forward Clutch
Low in Neutral Only	• Valve Body • Overdrive Servo • Intermediate Servo
Low in D5 Only	• Forward Clutch • Overdrive Servo • Intermediate Servo • Valve Body
Low in D4 Only (O/D Cancelled)	• Forward Clutch

	• Overdrive Servo • Intermediate Servo • Valve Body
Low in First Position	• Forward Clutch • Valve Body
Low in Second Position	• Intermediate Servo • Overdrive Servo • Intermediate Servo • Forward Clutch
Low in Third Position	• Intermediate servo • Overdrive servo • Forward clutch

Stall Speed Test

This test checks operation of the following items:

- torque converter clutch
- forward clutch
- low-one way clutch (OWC) assembly
- engine operation
- overdrive one-way clutch assembly

⚠ **WARNING: Apply the parking brake firmly while carrying out each stall test.**

⚠ **CAUTION: Always carry out the Line Pressure Test procedures prior to carrying out the Stall Speed Test. If line pressure is low at stall, do not carry out the Stall Speed Test or further transmission damage will occur.**

NOTE: The Stall Speed Test should be carried out with the engine and transmission at normal operating temperatures.

1. Connect tachometer to the engine.
2. ⚠ **CAUTION: After testing each of the following ranges D5, D4, 3, 2, 1 and R, move the transmission range selector lever to N (NEUTRAL) and run the engine at 1,000 rpm for about 15 seconds to allow the torque converter to cool before testing the next range.**

   ⚠ **CAUTION: Do not maintain wide open throttle (WOT) in any range for more than five (5) seconds.**

   ⚠ **CAUTION: If the engine rpm recorded by the tachometer exceeds maximum specified rpm, release the accelerator pedal immediately. Clutch or band slippage is indicated.**

   NOTE: Prolonged use of this procedure may set Diagnostic Trouble Code P0712, P1783. After carrying out Stall Speed Test, run OBD Test and clear DTCs from memory.

   Press accelerator pedal to floor (WOT) in each range. Record rpm reached in each range. Stall speeds should be as follows:

   Stall Speed Chart

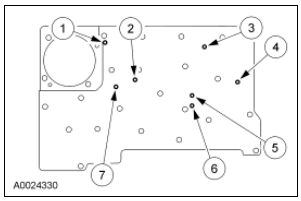
Vehicle	Engine	RPM
Lincoln LS	3.0L	2,555-3,045
Lincoln LS	3.9L	2,372-2,791

If stall speeds were too high, refer to the following Stall Speed Diagnosis Chart. If stall speeds were too low, first check the engine idle speed. If engine idle is OK, remove torque converter and check the torque converter one-way clutch for slippage.

Stall Speed Diagnosis Chart

Transmission Range Selector Lever Position	Stall Speeds High	Stall Speeds Low
D5, D4 and 1	Overdrive One-Way Clutch, Rear One-Way Clutch	
D4, 2 and 1	Forward Clutch, Overdrive One-Way Clutch	
D5	Forward Clutch, Overdrive One-Way Clutch	
D5, D4, 3, 2, 1 and R	General Pressure Concerns, Forward Clutch, Overdrive One-Way Clutch	Converter One-Way Clutch or Engine Driveability Concerns
R Only	High/Reverse, High Clutch, Low and Reverse Band/Servo	
2 Only	Intermediate Band/Servo	
1 Only	Low/Reverse Band/Servo	

Air Pressure Tests



Item	Part Number	Description
1		Reverse servo
2		Intermediate servo
3		Overdrive servo
4		Coast clutch
5		Forward clutch
6		Direct clutch
7		Reverse servo modulator

A no-drive or erratic shift condition may be due to inoperative bands and clutches. To diagnose these conditions a series of checks can be made by substituting air pressure for fluid to determine the location of the damaged or obstructed component.

Follow the procedure to determine the location of the inoperative clutch or band by substituting air pressure into the various test plate passages.

NOTE: Use only dry, regulated 276 kPa (40 psi) maximum air pressure.

1. Remove the main control valve body. Refer to Main Control Valve Body in this section.
2. Install the Transmission Test Plate and gasket. Tighten to 10 Nm (89 lb-in).
3. **NOTE:** Do not apply air to the test plate vent hole.

   Apply air to the appropriate clutch or servo port (refer to plate layout diagram). Refer to the Air Pressure Test Diagnostic Chart for conditions, possible causes and actions.
4. After the testing is completed, remove the Air Test Plate and Gasket and proceed with any repairs that are needed.
5. After the repairs are completed, install the Main Control Valve Body. Refer to Main Control Valve Body in this section.

Air Pressure Test Diagnostic Chart

Condition	Possible Causes	Actions
Dull thud heard or movement felt when air is applied and released	Clutches, bands and fluid passages are OK.	Concerns may not be in the transmission. Check the Powertrain Control Module (PCM), wiring harness and non-transmission related components.
No Drive	Clutches and bands inoperative.	Disassemble the transmission, clean and inspect to locate area of concern.
Erratic Shifts	Clutches and bands inoperative due to incorrect pressures.	Disassemble the transmission, clean and inspect to locate area of concern.
No dull thud heard	Clutches, bands and fluid passages may be damaged or obstructed.	Disassemble the transmission, clean and inspect to locate area of concern.
No movement felt	Clutches, bands and fluid passages may be damaged or obstructed.	Disassemble the transmission, clean and inspect to locate area of concern.
Hissing sound heard	Clutch seals or check ball may be damaged or leaking.	Disassemble the transmission, clean and inspect to locate area of concern.
Servos do not operate	Seals and pistons may be damaged. Supply and release ports may be obstructed. Spring may be broken.	Disassemble the transmission, clean and inspect to locate area of concern.
Multiple clutches are applied	Fluid passages in the center support or the clutch cylinders may be obstructed.	Disassemble the transmission, clean and inspect to locate area of concern. Check fluid passages in the center support for obstructions.

Leakage Inspection

Printable View (142 KB)

NOTE: An ultraviolet light must be used to detect the fluorescent dye solution.

1. Add UV Fluorescent Tracer dye (164-R3706 or equivalent specifically for ATF) to the automatic transmission fluid. Use 30 ml (1 oz) of dye solution for every 3.8L (4 quarts) of ATF capacity. Add any additional transmission fluid designated for this transmission/transaxle to bring the unit to the correct fluid level.

2. Start and run the engine. Shift the transmission through all gears several times to make sure that the fluorescent dye has had time to circulate. Observe the back of the engine cylinder block and the top of the converter housing part of the case for evidence of fluid leakage. Turn OFF the engine.

3. Raise the vehicle on a hoist.

4. **NOTE:** The leak source will probably be above and/or forward of the actual leak indication, due to airflow and/or gravity.

   Using an ultraviolet light, observe the transmission for possible leaks. Following the leak back to its source point, repair the leak as required.

External Fluid Leaks

Leak Path	Possible Source
Leaks at the fluid pan to case	• Pan bolts not tightened to specification. • Pan gasket damaged. • Case pan rail damaged.
Fluid cooler lines or fittings leaking	• Cooler line(s), cooler line fitting(s) damaged. Refer to Section 307-02 . • Cooler line fitting to case union damaged. Refer to Section 307-02 . • Case damage at case fitting.
Fluid cooler line nut-to-case fittings leaking	• • Damaged or missing O-ring seals. Refer to Section 307-02 . • Fitting(s) not tightened to specifications. Refer to Section 307-02 .
Leaks at the fluid cooler	• Fluid cooler damage. Refer to Section 307-02 . • Fitting(s) damaged or not tightened to specifications. Refer to Section 307-02 .
Leaks at external sensors	• Damaged or missing O-ring seals. • Screw not tightened to specification.
Leaks at the manual control lever seal	• Damaged or missing lever seal.

Leaks at the solenoid body harness connector	• Solenoid body harness connector O-ring seal(s), either on the harness end or the solenoid body, damaged or missing.
Fluid leakage in torque converter area	• For possible sources, refer to Fluid Leakage in the Torque Converter Area Chart.

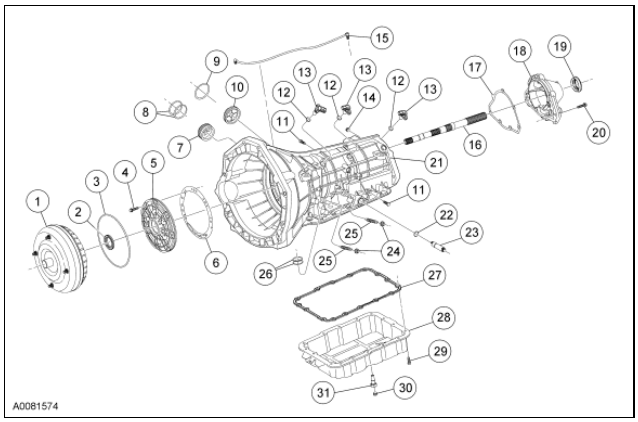
External Sealing

⚠ CAUTION: Do not try to stop a fluid leak by increasing the torque beyond specifications. This may cause damage to the transmission case threads.

The transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Seal washers
- Thread sealant

External Sealing



Item	Part Number	Description
1	7902	Torque converter assembly
2	7A248	Seal assembly front fluid pump
3	7A248	Seal front fluid pump
4	W704892-S300	Screw and washer assembly (8 required)
5	7G187	Fluid pump
6	7A136	Gasket fluid pump
7	7D027	Cover overdrive servo
8	W703119-S300	Seal overdrive servo cover (2 required)
9	W702969-S300	Seal intermediate servo cover
10	7D027	Cover intermediate servo
11	390318-S2	Plug pipe (2 required)
12	W702981-S300	O-ring seal sensor-to-case (3 required)
13	7H103	Sensor assembly (3 required)

14	6026	Plug case
15	7034	Vent assembly
16	7060	Shaft output
17	7086	Gasket extension housing
18	7A039	Extension housing assembly
19	7052	Seal extension housing
20	W500311-S309	Screw extension housing (7 required)
21	7005	Case assembly
22	7B498	Seal manual lever
23	7A256	Manual lever
24	7C492	Screw band adjuster (2 required)
25	71000-S100	Nut band adjuster (2 required)
26	W705928-S300	O-ring seal (2 required)
27	7A191	Gasket fluid pan
28	7A194	Fluid pan
29	W500213-S309	Screw fluid pan (16 required)
30	W704999	Plug short hex
31	7A101	Plug fluid drain

External Sealing

⚠ CAUTION: Do not try to stop a fluid leak by increasing the torque beyond specifications. This may cause damage to the transmission case threads.

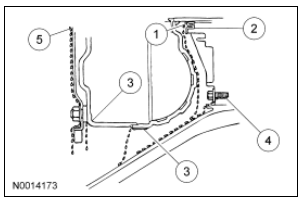
The transmission has the following parts to prevent external fluid leakage:

- Gaskets
- Lip-type seals
- O-ring seals
- Seal rings
- Seal grommets
- Seal washers
- Thread sealant

Fluid Leakage In Torque Converter Area

Leakage at the front of the transmission, as evidenced by fluid around the torque converter housing part of the case, may have several sources. By careful observation, it is possible in many instances to pinpoint the source of the leak before removing the transmission from the vehicle.

The paths, which the fluid takes to reach the bottom of the torque converter housing part of the case, are shown in the illustration. The 5 numbers in the illustration correspond with the 5 flow path steps.



Leak Path	Symptom	Possible Source
1, 2 and 4	Leak at the front of the transmission	Pump lip seal
1, 2 and 4	Leak at the front of the transmission	Vent
1, 2 and 4	Leak at the front of the transmission	Converter hub weld
1, 2 and 4	Leak at the front of the transmission	External pump seal (large)
1, 2 and 4	Leak at the front of the transmission	Pump-to-case screws
1, 2 and 4	Leak at the front of the transmission	Pump gasket
3	Leak at the front of the transmission	Torque converter seal weld
3	Leak at the front of the transmission	Torque converter stud
5	Leak at the front of the transmission	Engine oil leak; rear main seal
5	Leak at the front of the transmission	Engine valve cover
5	Leak at the front of the transmission	Oil galley
5	Leak at the front of the transmission	Engine oil pressure sensor

The Diagnosis by Symptom Index gives the technician diagnostic information and direction, and suggests possible components, using a symptom as a starting point.

Diagnosis by Symptom Index Directions

1. Using the Symptom Index, select the Concern/Symptom that best describes the condition.

2. Refer to the routine indicated in the Diagnosis by Symptom Index.

3. Always begin diagnosis of a symptom with:
    1. Preliminary inspections.
    2. Verifications of condition.
    3. Checking the fluid levels.
    4. Carrying out other test procedures as directed.

4. **NOTE:** Not all concerns and conditions with electrical components will set a diagnostic trouble code (DTC). Be aware that the components listed may still be the cause.

   NOTE: When the battery is disconnected or a new battery installed, certain transmission operating parameters can be lost. The powertrain control module (PCM) must relearn these parameters. During this learning process, you may experience slightly firm shifts, delayed or early shifts. This operation is considered normal and will not affect the function of the transmission. Normal operation will return once these parameters are stored by the PCM.

   Begin with the ROUTINE, if indicated. Follow the reference or action statements. Always carry out the on-board diagnostic tests as necessary. Never skip steps. Repair as necessary.

5. These components are listed in the removal sequence and by most probable cause. All components listed must be inspected to ensure correct repair.

5R55S	Routines
Engagement Concerns:	
• No Forward in D5 or D4 Only	201A
• No Forward Only (All Positions)	201B
• No Reverse Only	202
• Harsh Reverse Only	203
• Harsh Forward Only	204A
• Harsh Manual 1st Gear Only	204B
• Delayed/Soft Reverse Only	205
• Delayed/Soft Forward Only	206
• No Forward and No Reverse	207
• Harsh Forward and Harsh Reverse	208
• Delayed Forward and Delayed Reverse	209
Shift Concerns:	
• Some/All Shifts Missing (Automatic Mode Only)	210
• Timing Concern	
Early/Late (Some/All)	211

Erratic/Hunting (Some/All)	212
• Feel Concerns	
Soft/Slipping (Some/All)	213
Harsh (Some/All)	214
• No First Gear in Drive, Engages in a Higher Gear	215
• No First Gear in Manual 1st	216
• No Manual 2nd Gear	217
Torque Converter Clutch Operation Concerns:	
• Does Not Apply	240
• Always Applied/Stalls Vehicle	241
• Cycling/Shudder/Chatter	242
Other Concerns:	
• Shift Lever Efforts High	251
• External Leaks	252
• Noise/Vibration Forward or Reverse	254
• Engine Will Not Crank	255
• No Park Range	256
• Transmission Overheating	257
• No Engine Braking in Manual 2nd Position	258
• No Engine Braking in Manual 1st Position	259
• Fluid Venting or Foaming	261
• Vehicle Movement with Gear Selector in "N"	262
• Slips/Chatters in Manual 1st Gear	263
• Slips/Chatters in Manual 2nd Gear	264
• No Engine Braking in Manual 3rd Position	280
	281

• No Engine Braking in Manual 4th (D4) Position	
• Slips/Chatters in Manual 3rd Gear	282
• Engine Braking in ALL Gears	283
• No 2nd and 5th Gears	284
• No 3rd, 4th and 5th gears	285

Diagnostic Routines

Engagement Concern: No Forward in D5 or D4 Only

Possible Component	Reference/Action
201A ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Main Control	
· Screw not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seal rings or bearing damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damaged	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.

· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.
Forward Planetary Assembly	
· Planetary damage	· Inspect for damage. Repair as necessary.
Low One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Engagement Concern: No Forward

Possible Component	Reference/Action
201B ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out the fluid condition check. Refer to Preliminary Inspection in this section.
Main Control	
· Screw not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
	· Inspect for damage. Repair as necessary.

· Bronze seal ring or bearing damaged	
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Case	
· Damaged	· Inspect for damage. Repair as necessary.

Engagement Concern: No Reverse

Possible Component	Reference/Action
202 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid C (PC C), Shift Solenoid B (SSB)	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damage	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect or damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
	· Inspect for damage. Repair as necessary.

· Seals (piston and cover) damaged	
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
Reverse Drum Assembly	
· One-way clutch damaged	· Inspect for damage. Install a new drum assembly.
· Bearing damaged	· Inspect for damage. Install a new drum assembly.
Torque Converter Assembly	
· Torque converter internal failure preventing engagement, piston release	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Engagement Concern: Harsh Reverse ONLY

Possible Component	Reference/Action
203 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid C (PC C)	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, spring damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.

Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
Reverse Drum Assembly	
· One-way clutch damaged	· Inspect for damage. Install a new drum assembly.
· Bearing damaged	· Inspect for damage. Install a new drum assembly.

Engagement Concern: Harsh Forward ONLY

Possible Component	Reference/Action
204A ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid A (PC A), Pressure Control Solenoid C (PC C)	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High Pressures	· Check pressure at line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.

· Filter damaged, missing	· Inspect for damage, repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seal rings or bearing damage	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damage	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.

Engagement Concern: Harsh Manual 1st Gear ONLY

Possible Component	Reference/Action
204B ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PC B), Turbine Shaft Speed (TSS) sensor	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.

Engagement Concern: Delayed or Soft Reverse ONLY

Possible Component	Reference/Action
205 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid C (PC C)	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect pressures	
· Low pressure	· Check pressure at line and PC C taps.

	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.

Engagement Concern: Delayed/Soft Forward ONLY

Possible Component	Reference/Action
206 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PC B)	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· Low pressures	· Check pressure at line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	

· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, spring damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged.	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seal rings or bearing damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damaged	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction element damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.

Engagement Concern: No Forward and No Reverse

Possible Component	Reference/Action
207 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoid B (PC B)	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .

	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Shift Cable/Digital TR Sensor	
· Cable system or digital TR sensor damaged, misaligned	· Inspect and repair as necessary. Refer to Transmission Range (TR) Sensor Adjustment in this section.
Main Control	
· Screws not tightened to specification	· Tighten screws to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Input Shaft	
· Damaged	· Inspect for damage. Repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs, or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
OD Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Center Shaft Assembly	
· Damaged. One-way clutch damaged	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.

Forward Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Reverse Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Output Shaft	
· Damage	· Inspect for damage. Repair as necessary.
Torque Converter	
· Damaged flexplate or adapter plate	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.
· Damaged impeller hub	
· Damaged turbine hub	
Direct One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Engagement Concern: Harsh Forward and Harsh Reverse

Possible Component	Reference/Action
208 ROUTINE	
Powertrain Control System	
· PCM, vehicle wring harnesses, digital TR sensor, Transmission Fluid (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test B and Go To Pinpoint Test C .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust to the correct level. For additional information, refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. For additional information, refer to Preliminary Inspection .
Incorrect Pressures	
· High pressures.	· Check line pressure at line and PC C taps.
	· Carry out Line Pressure Test, refer to Special Testing Procedures in this section. Follow pressure diagnosis and repair as required.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main

	control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.

Engagement Concern: Delayed Forward and Delayed Reverse

Possible Component	Reference/Action
209 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test B .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust to the correct level. For additional information, refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. For additional information, refer to Preliminary Inspection .
Incorrect Pressures	
· High pressures	· Check line pressure at line and PC C taps.
	· Carry out Line Pressure Test, refer to Special Testing Procedures in this section. Follow pressure diagnosis and repair as required.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves and springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.

· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs, or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.

Shift Concern: Some/All Shifts Missing (Automatic Mode Only)

Possible Component	Reference/Action
210 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, B, C, Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoids A, B, C, Output Shaft Speed (OSS) sensor, digital TR sensor, IAT sensor, VSS input	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT and VSS.
	· Go To Pinpoint Test A , Go To Pinpoint Test C , Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Some Shifts Missing ONLY	
	· If only some shifts are missing, determine which shift(s) is missing.
	· Refer to the following routine(s) for further No Shift concerns: ♦ No 1-2 Shift, Routine 220 ♦ No 2-3 Shift, Routine 221 ♦ No 3-4 Shift, Routine 222 ♦ No 4-5 Shift, Routine 270 ♦ No 5-4 Shift, Routine 271 ♦ No 4-3 Shift, Routine 223 ♦ No 3-2 Shift, Routine 224 ♦ No 2-1 Shift, Routine 225
Fluid	
· Incorrect level	· Adjust fluid to correct level, refer to the in this section.
· Condition	· Carry out Fluid Condition Check. For additional information, refer to Preliminary Inspection in this section.
Shift Cable/Digital TR Sensor	
· Cable system or digital TR sensor damaged, misaligned	· Inspect and repair as necessary. For additional information, refer to Transmission Range (TR) Sensor Adjustment in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at line and PC C taps.

	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs, or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
OD Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seal rings or bearing damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damaged	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.

Shift Concern: Timing Concerns Early/Late

Possible Component	Reference/Action
211 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Output Shaft Speed (OSS) sensor, IAT sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM and IAT.
	· Go To Pinpoint Test E .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.

Some Shifts Early/Late ONLY	
	· If only some shifts are early/late, determine which shift(s) is missing.
	· Refer to the following routine(s) for further No Shift concerns: ♦ Soft/Slipping 1-2 Shift, Routine 226 ♦ Soft/Slipping 2-3 Shift, Routine 227 ♦ Soft/Slipping 3-4 Shift, Routine 228 ♦ Soft/Slipping 4-5 Shift, Routine 272 ♦ Soft/Slipping 5-4 Shift, Routine 273 ♦ Soft/Slipping 4-3 Shift, Routine 229 ♦ Soft/Slipping 3-2 Shift, Routine 230 ♦ Soft/Slipping 2-1 Shift, Routine 221
Fluid	
· Incorrect level	· Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Shift Concern: Timing Concerns Erratic/Hunting (Some/All)

Possible Component		Reference/Action
212 ROUTINE		
Powertrain Control System		
	· PCM, vehicle wiring harnesses, Output Shaft Speed (OSS) sensor, IAT sensor	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM and IAT.
		· Go To Pinpoint Test E .

		· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid		
	· Incorrect level	· Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
	· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Main Control		
	· Screws not tightened to specification	· Tighten to specification.
	· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
	· Contamination	· Disassemble and clean.
	· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
	· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo		
	· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
	· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Further Diagnosis		
	· For further diagnosis for timing issues, refer to Reference/Actions	· Refer to the following routine(s) for specific diagnosis: • No 1-2 Shift, Routine 220 • No 2-3 Shift, Routine 221 • No 3-4 Shift, Routine 222 • No 4-5 Shift, Routine 270 • No 5-4 Shift, Routine 271 • No 4-3 Shift, Routine 223 • No 3-2 Shift, Routine 224 • No 2-1 Shift, Routine 225 • Soft/Slip 1-2 Shift, Routine 226 • Soft/Slip 2-3 Shift, Routine 227 • Soft/Slip 3-4 Shift, Routine 228 • Soft/Slip 4-5 Shift, Routine 272 • Soft/Slip 5-4 Shift, Routine 273 • Soft/Slip 4-3 Shift, Routine 229 • Soft/Slip 3-2 Shift, Routine 230 • Soft/Slip 2-1 Shift, Routine 231 • Harsh 1-2 Shift, Routine 232 • Harsh 2-3 Shift, Routine 233 • Harsh 3-4 Shift, Routine 234 • Harsh 4-5 Shift, Routine 274 • Harsh 5-4 Shift, Routine 275 • Harsh 4-3 Shift, Routine 235 • Harsh 3-2 Shift, Routine 236 • Harsh 2-1 Shift, Routine 237

Engagement Concern: Feel Soft/Slipping (Some/All)

Possible Component	Reference/Action
213 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, B, C, Pressure Control Solenoids A, B, C, D, Intermediate Shaft Speed sensor, Transmission Fluid Temperature (TFT) sensor, IAT Sensor, VSS input	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT and VSS.
	· Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Some Shifts Soft/Slipping ONLY	
	· If only some of the shifts are soft/slipping, determine which shift(s) is missing.
	· Refer to the following routine(s) for further Soft/Slipping concerns: ♦ Soft/Slipping 1-2 Shift, Routine 226 ♦ Soft/Slipping 2-3 Shift, Routine 227 ♦ Soft/Slipping 3-4 Shift, Routine 228 ♦ Soft/Slipping 4-5 Shift, Routine 272 ♦ Soft/Slipping 5-4 Shift, Routine 273 ♦ Soft/Slipping 4-3 Shift, Routine 229 ♦ Soft/Slipping 3-2 Shift, Routine 230 ♦ Soft/Slipping 2-1 Shift, Routine 231
Fluid	
· Incorrect level	· Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	

· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs, or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
Coast Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seal rings or bearings damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damage	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Intermediate Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Case	
· Damaged	· Inspect for damage. Repair as necessary.
Torque Converter Assembly	
· Torque Converter internal failure preventing engagement, piston release	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Shift Concern: Feel Harsh (Some/All)

Possible Component	Reference/Action
214 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, B, C, Pressure Control Solenoids A, B, C, D, Intermediate Shaft Speed sensor, digital TR sensor, Transmission Fluid Temperature (TFT) sensor, IAT sensor, VSS input	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM, IAT and VSS.
	· Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Some Shifts Harsh ONLY	
	· If only some of the shifts are harsh, determine which shift(s) is missing.
	· Refer to the following routine(s) for further No Shift concerns: ♦ Harsh 1-2 Shift, Routine 232 ♦ Harsh 2-3 Shift, Routine 233 ♦ Harsh 3-4 Shift, Routine 234 ♦ Harsh 4-5 Shift, Routine 274 ♦ Harsh 5-4 Shift, Routine 275 ♦ Harsh 4-3 Shift, Routine 235 ♦ Harsh 3-2 Shift, Routine 236 ♦ Harsh 2-1 Shift, Routine 237
Fluid	
· Incorrect level	· Adjust to the correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at line and PC C taps.
	· Carry out Line Pressure Test, refer to Special Testing Procedures in this section. Follow pressure diagnosis and repair as required.
Main Control	
· Screws not tightened to specification	· Tighten to specification.

· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck, or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Input Shaft	
· Damaged	· Inspect for damage. Install new as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Center Shaft Assembly	
· Center shaft assembly damaged	· Inspect for damage. Repair as necessary.
· One-way clutch damaged	· Inspect for damage. Repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Intermediate Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Output Shaft	

· Damaged	· Inspect for damage. Install new as necessary.
Case	
· Damaged	· Inspect for damage. Repair as necessary.

Shift Concern: No 1st and 2nd Gear in Drive, Engages in a Higher Gear

Possible Component	Reference/Action
215 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, B, C, digital TR sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test C .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Check which pressures are on at line and PC C taps. Refer to Special Testing Procedures in this section.
	· Refer to the Band/Clutch Chart in this section to determine which gears are on. Follow the diagnostic routines to repair the missing gears.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Direct One-way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.
Low One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Engagement Concern: No 1st Gear in Manual 1 Position

Possible Component	Reference/Action
216 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, B, Pressure Control Solenoids B, C	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test D .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Direct One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.
Low One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Shift Concern: No 2nd Gear in Manual 2 Position

Possible Component	Reference/Action
217 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, B, C, Pressure Control Solenoid B	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test D .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Check pressure at line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this

	section.
Main Control	
· Screws not tightened to specification.	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install a new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Direct One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.
Low One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Torque Converter Operation Concerns: Does Not Apply

Possible Component	Reference/Action
240 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid, Transmission Fluid Temperature (TFT) sensor and Engine Coolant Temperature (ECT) sensor	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test B .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Check pressure at line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.

Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
Torque Converter Assembly	
· Torque Converter internal failure preventing engagement, piston application	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Torque Converter Operation Concern: Always Applied/Stalls Vehicle

Possible Component	Reference/Action
241 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.

Low One-Way Clutch	
· Worn, damaged or assembled incorrectly.	· Inspect for damage. Repair as necessary.
Torque Converter Assembly	
· Torque Converter internal failure preventing engagement, piston release	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Torque Converter Operation Concern: Cycling/Shudder/Chatter

Possible Component	Reference/Action
242 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid	· Carry out on-board diagnostic tests. For additional information, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A .
	· Repair as necessary. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Condition contaminated, degraded	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section. If contaminated, locate source of contamination. If burnt, inspect mechanical bands, clutches. Repair as necessary. Change fluid. Carry out drain and refill procedure. Refer to Transmission Fluid Drain and Refill Without Torque Converter Drain Plug in this section. Carry out fluid cooler and torque converter cleaning procedure. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve, springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Torque Converter Assembly	
· Torque converter internal leakage, clutch material damaged	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Other Concerns: Shift Lever Efforts High

Possible Component	Reference/Action
251 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, digital TR sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test C .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Shift Cable, Digital TR sensor	
· Cable system or digital TR sensor damaged, misaligned	· Inspect and repair as necessary. For additional information, refer to Transmission Range (TR) Sensor Adjustment in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Case	
· Manual control lever assembly damage, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged	· Inspect for damage. If damaged, install a new part.
· Manual valve lever shaft retaining pin damaged	· Inspect for damage. If damaged, repair as necessary.

Other Concerns: External Leaks

Possible Component	Reference/Action
252 ROUTINE	
Powertrain Control System	
· Output Shaft Speed (OSS) sensor, Intermediate Shaft Speed, Turbine Shaft Speed (TSS) sensor, digital TR sensor	· Inspect for leakage. If areas around sensor show signs of leakage, install a new sensor O-ring seal. If area behind digital TR sensor shows signs of a leak, a new manual lever shaft seal may need to be installed.
Fluid	
· Incorrect level	· Adjust to correct level. Refer to Transmission Fluid Level Check in this section.
Case	
· Case vent damaged	· Inspect for damage. If damaged, repair as necessary.
· Output shaft flange damage	· Inspect for damage. If damaged, repair as necessary.
Seals/Gaskets	

· Leakage at gaskets, seals, cooler lines, torque converter studs, etc.	· Refer to Leakage Inspection in this section for potential leak locations.
	· Remove all traces of lubricant on exposed surfaces of the transmission. Check vent for free breathing. Operate the vehicle at normal temperatures and carry out leak check test, refer to Leakage Inspection in this section. Repair as necessary.

Other Concern: Noise/Vibration Forward or Reverse

Possible Component	Reference/Action
254 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoids A, B, C	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Shift Cable/Digital TR Sensor	
· Cable or digital TR Sensor damaged, misaligned	· Inspect and repair as necessary. For additional information, refer to Transmission Range (TR) Sensor Adjustment in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves/springs damaged, misassembled, missing, stuck, or bore damaged, thermostatic bypass valve damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
Low One-Way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.
Flexplate or Adapter Plate	

· Damaged	· Inspect for damage. Repair as necessary.
· Nuts not tightened to specification	· Tighten to specification.
· Adapter plate not aligned correctly	· Remove transmission and using special service tool and procedure in this section, align adapter plate.
Clutch Assemblies	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for damage, mislocation, poor seating. Install a new cylinder as necessary.
· Friction elements damaged or worn.	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Torque Converter Assembly	
· Torque converter hub damaged	· Inspect for damage. Repair as necessary.

Other Concern: Engine Will Not Crank

Possible Component	Reference/Action
255 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, digital TR sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test C .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Shift Cable/Digital TR Sensor	
· Cable or digital TR Sensor damaged, misaligned	· Inspect and repair as necessary. For additional information, refer to Transmission Range (TR) Sensor Adjustment in this section.
Main Control/Park System/TR Sensor Alignment	
· Detent spring, rooster comb, manual lever and TR sensor are not correctly aligned together.	· Disconnect TR sensor electrical connector. Remove outer manual lever nut. Loosen TR sensor screws. Loosen detent spring screw. Move manual lever through all gear ranges. Place manual lever into the NEUTRAL position. Tighten the detent spring screw to correct specification. Install TR sensor alignment tool. Tighten the TR sensor screws alternating sequence until correct tightening specification is obtained. Remove tool. Install outer manual lever and nut. Tighten nut to correct specification. Install TR sensor connector. Verify that the vehicle will start in PARK and NEUTRAL. Verify that the reverse backup lamps illuminate in REVERSE.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.

· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
Flexplate or Adapter Plate	
· Damaged	· Inspect for damage. Repair as necessary.

Other Concern: No Park Range

Possible Component	Reference/Action
256 ROUTINE	
Shift Cable/Digital TR sensor	
· Cable system or digital TR sensor damaged, misaligned	· Inspect and repair as necessary. For additional information, refer to Transmission Range (TR) Sensor Adjustment in this section.
Case	
· Manual control lever assembly damage, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged	· Inspect for damage. If damaged, repair as necessary.
· Manual valve lever shaft retaining pin damaged	· Inspect for damage. If damaged, repair as necessary.
Park System	
· Park gear, parking pawl, parking pawl return spring, park or guide plate, parking actuating rod, parking pawl shaft, manual lever, manual lever detent spring damaged or misassembled	· Inspect for damage. If damaged, repair as necessary.
· External linkages/brackets damaged	· Inspect for damage. If damaged, repair as necessary.

Other Concern: Transmission Overheating

Possible Component	Reference/Action
257 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Torque Converter Clutch (TCC) solenoid, Pressure Control Solenoids A, B, C, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

	· Go To Pinpoint Test A , Go To Pinpoint Test B and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust to correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves/springs damaged, misassembled, missing, stuck or bore damaged, thermostatic bypass valve damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
Case	
· Case vent damaged	· Inspect for damage. If damaged, repair as necessary.
Torque Converter Assembly	
· Seized torque converter one-way clutch	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.
· Excessive slip detected	
Other	
· Restriction in the transmission cooling system	· Refer to Section 307-02 for information and diagnosis of cooling issues.
· Excessive trailer tow load	· Refer to the owner guide for specifications on trailer towing.
· Engine driveability concerns	· Check engine. Refer to Section 303-00 .

Other Concern: No Engine Braking in Manual 3rd Position

Possible Component	Reference/Action
280 ROUTINE	

Powertrain Control System	
· PCM, vehicle wiring harnesses, shift solenoids A, B, C, reverse pressure (RP) switch, pressure control solenoids A, B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A , Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Coast Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seals rings or bearing damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damaged	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Intermediate Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Other Concern: No Engine Braking in Manual 4th (D) Position

Possible Component	Reference/Action
281 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoid D, Reverse Pressure (RP) switch, Pressure Control Solenoid B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A , Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Coast Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.

Other Concerns: No Engine Braking in Manual 2nd Position

Possible Component	Reference/Action
258 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, C, D, Pressure Control Solenoid A	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Incorrect Pressures	

· High/low pressures	· Check pressure at line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Other Concern: No Engine Braking in Manual 1st Position

Possible Component	Reference/Action
259 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoids A, C, D, Pressure Control Solenoids A, B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to the correct level, refer to Transmission Fluid Level Check in this section.
Incorrect pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.

Other Concerns: Fluid Venting/Foaming

Possible Component	Reference/Action
261 ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.

Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
Case	
· Case vent damaged	· Inspect for damage. If damaged, repair as necessary.
Other	
· Transmission overheating	· Refer to 257 routine in this section.

Other Concern: Vehicle Movement with Gear Selector in "N" Position

Possible Component	Reference/Action
262 ROUTINE	
Fluid	
· Incorrect level	· Adjust fluid to correct level. Refer to Transmission Fluid Level Check in this section.
Shift Cable/Digital TR sensor	
· Cable system or digital TR sensor damaged, misaligned	· Inspect and repair as necessary. For additional information, refer to Transmission Range (TR) Sensor Adjustment in this section.
Incorrect pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Clutch Assemblies	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for damage, mislocation, poor seating. Install a new cylinder as necessary.
· Friction elements damaged or worn.	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Case	
· Manual control lever assembly damage, manual valve inner lever pin bent, manual valve inner lever damaged, spring rod damaged	· Inspect for damage. If damaged, repair as necessary.
· Manual valve lever shaft retaining pin damaged	· Inspect for damage. If damaged, repair as necessary.

Other Concern: Slips/Chatters in Manual 1st Position

Possible Component	Reference/Action
263 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoids A, B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Fluid Pump Assembly	
· Screws not tightened to specification	· Tighten screws to specification.
· Gasket damaged	· Inspect for damage. If damaged, install a new gasket.
· Porosity, cross leaks, ball missing, plugged hole	· Inspect for damage. If damaged, repair as necessary.
· Pump gears cracked and/or seized	· Inspect for damage. Install a new pump.
· Flow control valves, springs, or seals damaged, stuck or not assembled correctly	· Inspect for damage. Install a new seal or flow control valve.
Forward Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.

· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.
Reverse Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Reverse Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
Direct One-way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Other Concern: Slips/Chatters in Manual 2nd Position

Possible Component	Reference/Action
264 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoids A, B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
OD Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	

· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.

Other Concern: Slip/Chatters in Manual 3rd Position

Possible Component	Reference/Action
282 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoids A, B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Fluid	
· Incorrect level	· Adjust fluid to the correct level. Refer to Transmission Fluid Level Check in this section.
· Condition	· Carry out Fluid Condition Check. Refer to Preliminary Inspection in this section.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Intermediate Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Forward Clutch Assembly	

· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
· Bronze seal ring or bearing damaged	· Inspect for damage. Repair as necessary.
Direct One-way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.
Low One-way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Other Concern: Engine Braking in ALL Gears

Possible Component	Reference/Action
283 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoid D	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Torque Converter Assembly	
· Torque Converter internal failure preventing engagement, piston release	· Remove the transmission. Inspect for damage. Refer to Torque Converter in the General Procedures portion of this section. If the torque converter fails to pass the criteria or is damaged, install a new or remanufactured torque converter.

Other Concern: No 2nd and 5th Gears

Possible Component	Reference/Action
284 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoids B, C	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.

Other Concern: No 3rd, 4th and 5th Gears

Possible Component	Reference/Action
285 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Pressure Control Solenoids A, B	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
OD Planetary Assembly	
· Planetary damaged	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Intermediate Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Shift Concern: Harsh 1-2 Shift

Possible Component	Reference/Action
232 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Control Solenoid C, Pressure Control Solenoids B, Turbine Shaft Speed (TSS) sensor, Digital TR sensor, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test C , Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.

Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Shift Concern: Harsh 2-3 Shift

Possible Component	Reference/Action
233 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Control Solenoid B, Pressure Control Solenoids A, Turbine Shaft Speed (TSS) sensor, Intermediate Shaft Speed sensor, Digital TR sensor, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test C , Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps. Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.

· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
Intermediate Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.
Direct One-way Clutch	
· Worn, damaged or assembled incorrectly	· Inspect for damage. Repair as necessary.

Shift Concern: Harsh 3-4 Shift

Possible Component	Reference/Action
234 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Control Solenoid A, Pressure Control Solenoids C, Digital TR sensor, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test C and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	

· High/low pressures	· Check pressure at Line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
Center Support	
· Screws not tightened to specification	· Tighten to specification.
· Seal rings or bearing damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damaged	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.

Shift Concerns: Harsh 4-5 Shift

Possible Component	Reference/Action
274 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoid C, Pressure Control Solenoid B, Turbine Shaft Speed (TSS) sensor, Digital TR sensor, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.
	· Go To Pinpoint Test A , Go To Pinpoint Test B , Go To Pinpoint Test C , Go To Pinpoint Test D and Go To Pinpoint Test E .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.

Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator.
· Contamination	· Disassemble and clean.
· Valve/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seal (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Shift Concern: Harsh 5-4 Shift

Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
Center Support	
· Screw not tightened to specification	· Tighten to specification.
· Seal rings or bearing damaged	· Inspect for damage. Repair as necessary.
· Outside diameter of case bore damaged	· Inspect for damage. Repair as necessary.
· Support damaged or leaking	· Inspect for damage. Repair as necessary.
Direct Clutch Assembly	
· Seals, piston damaged	· Inspect for damage. Repair as necessary.
· Check ball damaged, missing, not seating, off location	· Inspect for mislocation, poor seating, damage. Install a new cylinder.
· Friction elements damaged or worn	· Inspect for damage. Repair as necessary.
· Return springs damaged	· Inspect for damage. Repair as necessary.
Intermediate Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.

Shift Concern: Soft/Slipping 4-5 Shift

Possible Component	Reference/Action
272 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoid C, Pressure Control Solenoid B, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

	· Go To Pinpoint Test A , Go To Pinpoint Test B and Go To Pinpoint Test D .
	· Repair as required. Clear DTCs, road test and rerun on-board diagnostic test.
Incorrect Pressures	
· High/low pressures	· Check pressure at Line and PC C taps.
	· Carry out Line Pressure Test. Refer to Special Testing Procedures in this section.
Main Control	
· Screws not tightened to specification	· Tighten to specification.
· Separator plate damaged	· Inspect for damage. If damaged, install a new separator plate.
· Contamination	· Disassemble and clean.
· Valves/springs damaged, misassembled, missing, stuck or bore damaged	· If damaged or parts are missing, install new main control assembly. If misassembled, reassemble correctly. DO NOT stone, file or sand valves. This will remove the anodized finish and may result in further main control or transmission damage.
· Filter damaged, missing	· Inspect for damage, repair as necessary.
OD Servo	
· Servo retaining screws damaged	· Inspect for damage. Repair as necessary.
· Seals (piston and cover) damaged	· Inspect for damage. Repair as necessary.
OD Band	
· Band damaged	· Inspect for damage. Repair as necessary.
· Servo worn or damaged	· Inspect for damage. Repair as necessary.
· Not adjusted correctly	· Inspect for damage. Repair as necessary.

Shift Concern: Feel Soft/Slipping 5-4 Shift

Possible Component	Reference/Action
273 ROUTINE	
Powertrain Control System	
· PCM, vehicle wiring harnesses, Shift Solenoid C, Pressure Control Solenoid C, Transmission Fluid Temperature (TFT) sensor	· Carry out on-board diagnostic tests. Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual for diagnosis and testing of the PCM.

Transmission Fluid Level Check

Printable View (187 KB)

Special Tool(s)

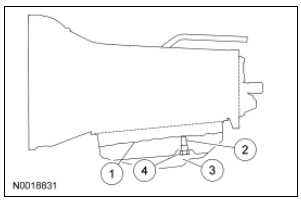
 ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)
ST1269-A	Vacuum Pump Kit 416-D002 (D95L-7559-A)
ST2715-A	Fluid Transporter/Evacuator/Injector 307-D465
ST2332-A	Worldwide Diagnostic System (WDS) New Generation Star (NGS) Tester, or equivalent scan tool
 ST2581-A	Adapter, Fluid Level and Fill Plug 307-437

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Fluid Fill Reference

NOTE: Left side of case is shown.



Item	Part Number	Description
1		Fluid level
2	7A010	Fluid level tube
3	W704999-S309	Fluid level and fill plug (small) (in-vehicle)
4	7A010	Fluid drain plug (large)

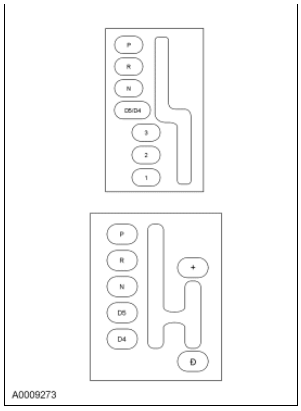
1. Using the scan tool (WDS), monitor the transmission fluid temperature (TFT) using PID: TFT.

2. Start the vehicle.

3. **NOTE:** Engine idle speed is approximately 650 rpm.

   While proceeding with this procedure, run the engine until the transmission fluid temperature is between 27°C - 49°C (80°F - 120°F).

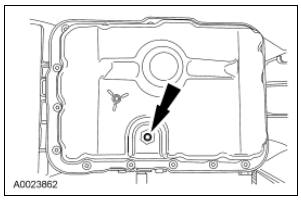
4. Move the range selector lever slowly through each gear, stopping in each position and allowing the transmission to engage.



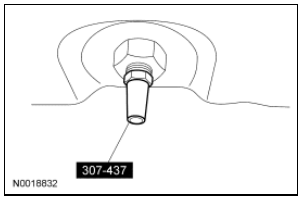
5. Place the range selector lever in the PARK position.

6. With the engine running, position the vehicle on a hoist and set it as close to level as possible. For additional information, refer to Section 100-02 .

7. Hold the larger drain plug with a wrench and remove the small (center) fluid level indicating plug.

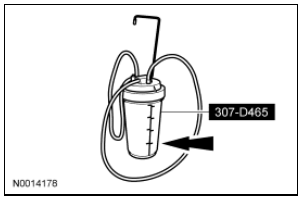


8. Install the special tool into the pan.

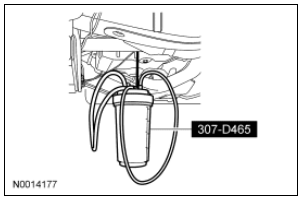


9. **NOTE:** Prior to filling the special tool with clean transmission fluid, make sure that the canister is clean.

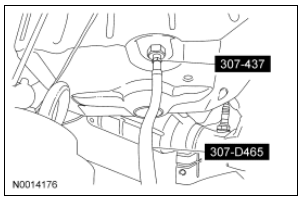
   Fill the special tool with clean automatic transmission fluid.



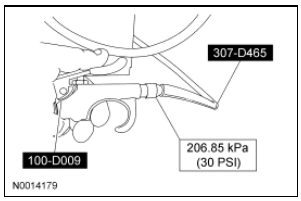
10. Hang the special tool under the vehicle. Position it upright and close to the transmission.



11. Connect the special tools.
    - Connect the open end of the fluid hose from the Fluid Transporter/Evacuator/Injector to the Fluid Level and Fill Plug Adapter at the bottom of the transmission fluid pan.



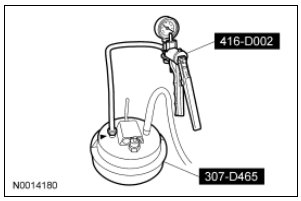
12. Apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the special tool. Fluid will immediately start flowing out of the special tool into the transmission fluid pan.



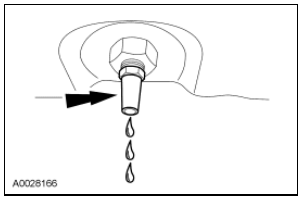
13. Add one pint of transmission fluid into the fluid pan. Stop the process by releasing the air pressure and removing the air nozzle from the end of the hose.

14. Inspect the fluid level in the special tool. If the fluid drains back into the canister, the transmission is full. If no fluid drains back, more fluid will need to be added. Repeat steps 12 and 13.

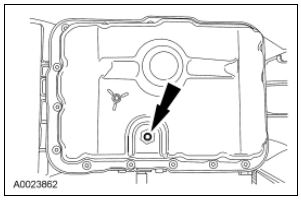
15. Once the transmission is full, place a hand vacuum pump on the open end of the vacuum/pressure hose of the special tool and apply vacuum to the system. This will pull out any extra fluid trapped in the system and direct it into the container.



16. Allow the fluid to drain. Make sure that the fluid temperature is between 27°C - 49°C (80°F - 120°F). When the fluid comes out as a thin stream or drip, the fluid is at the correct level.



17. Reinstall the small (center) fluid level indicating plug and tighten to 10 Nm (89 lb-in).



18. Check the operation of the transmission by moving the range selector lever slowly through each gear, stopping in each position and allowing the transmission to engage.

Transmission Fluid In-Line Filter

Printable View (84 KB)

Material

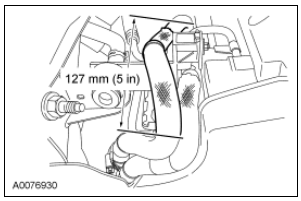
Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

NOTE: Use the following guidelines for installing the transmission fluid in-line filter:

- If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.
- If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.
- If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.
- If installing a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Cut a section of the rubber hose to allow installation of the transmission fluid in-line filter.

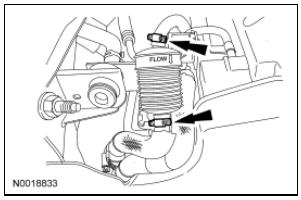


3. **⚠ CAUTION: The filter has a bypass valve in it. The red arrow on the filter indicates the direction of fluid flow through the filter. The filter must be installed in the fluid cooler return line with the red arrow on the filter pointing away from the transmission fluid cooler and toward the transmission (the return line has fluid coming out of the cooler going to the transmission). If the fluid filter is not installed correctly, it will cause internal transmission damage.**

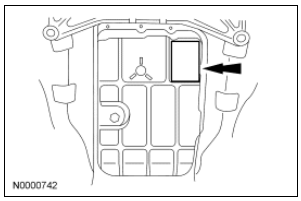
   ⚠ CAUTION: Do not install any rubber hoses or steel tubing with a bend entering the filter greater than 60 degrees.

   Install the one end of the filter into the rubber hose with a clamp, then install the other end of the filter into the rubber hose.

   - Install and tighten the 2 hose clamps.



4. Clean a visible section of the transmission fluid pan and install the sticker indicating that the vehicle is equipped with an in-line filter.



5. Fill the transmission with clean automatic transmission fluid.
    - Verify for correct operation.
    - Check the filter for leaks.

Transmission Fluid Drain and Refill Automated Equipment

Printable View (16 KB)

Special Tool(s)

	Automatic Transmission Flush and Fill Machine 211-00018 Automatic Transmission Flush and Fill Machine 199-00010 or equivalent

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Draining

⚠ CAUTION: Use only clean automatic transmission fluid specified for this transmission. Do not use supplemental transmission fluid additives, treatments or clean agents. The use of these materials can affect transmission operation and result in damage to internal transmission components.

⚠ CAUTION: Always refer to the instructions supplied with the flush and fill machine.

1. With the vehicle in PARK, position it on a hoist. For additional information, refer to Section 100-02 .
2. Use a suitable flush and fill machine to change the fluid.
3. When connecting the flush and fill machine, connect the machine to the fluid cooler tube after the fluid cooler on the cooler return line. This will help remove any foreign material trapped in the fluid coolers.

Refill

1. Use only clean automatic transmission fluid.
2. Once the fluid exchange has been completed, disconnect the flush and fill machine. Reconnect any disconnected fluid cooler tubes.
3. With the engine running, check and adjust the transmission fluid level, and check for any leaks. If fluid is needed, add fluid in increments of 0.24 liter (0.5 pint) until the correct level is achieved. For additional information, refer to Transmission Fluid Level Check in this section.

Transmission Fluid Drain and Refill Without Torque Converter Drain Plug

Printable View (186 KB)

Special Tool(s)

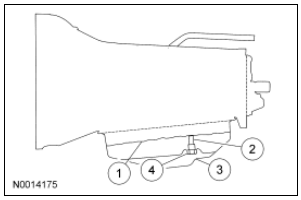
 ST2467-A	Rubber Tip Air Nozzle 100-D009 (D93L-7000-A)
ST1269-A	Vacuum Pump Kit 416-D002 (D95L-7559-A)
ST2715-A	Fluid Transporter/Evacuator/ Injector 307-D465
 ST2581-A	Adapter, Fluid Level and Fill Plug 307-437
ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication module (VCM) with appropriate adapters, or equivalent diagnostic tool

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Fluid Fill Reference

NOTE: Left side of case is shown.



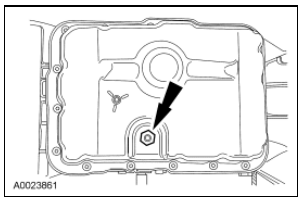
Item	Part Number	Description
1		Fluid level
2	7A010	Fluid level tube
3	W704999-S309	Fluid level and fill plug (small) (in-vehicle)

4	7A010	Fluid drain plug (large)

Draining

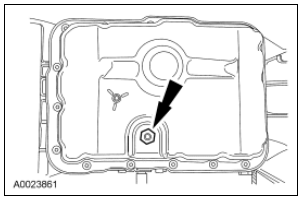
1. With the vehicle in NEUTRAL, position it on a hoist. Set the vehicle as close to level as possible. For additional information, refer to Section 100-02 .

2. Remove the drain plug (large plug) and allow the fluid to drain.

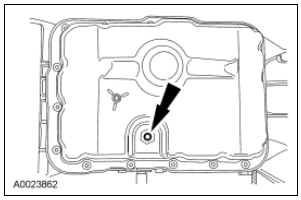


Filling

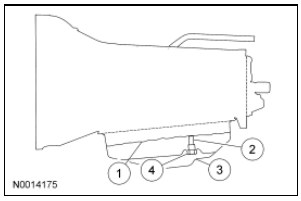
1. Install the fluid drain plug.
   - Tighten to 26 Nm (19 lb-ft).



2. Hold the larger drain plug with a wrench and remove the small (center) fluid level indicating plug.

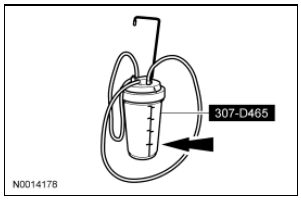


3. Install the special tool into the pan.

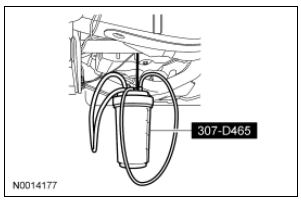


4. **NOTE:** Prior to filling the special tool with clean transmission fluid, make sure that the canister is clean.

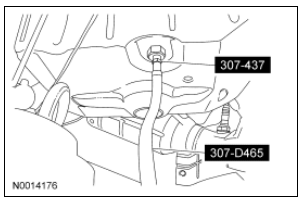
   Fill the special tool with clean automatic transmission fluid.



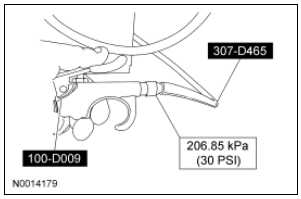
5. Hang the special tool under the vehicle, upright and close to the transmission.



6. Connect the special tools.
    - Connect the open end of the fluid hose from the Fluid Transporter/Evacuator/Injector to the Adapter, Fluid Level and Fill Plug at the bottom of the transmission fluid pan.



7. Apply a maximum of 206.85 kPa (30 psi) to the open end of the vacuum/pressure hose from the special tool. Fluid will immediately start flowing out of the special tool into the transmission fluid pan.



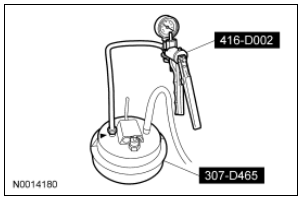
8. Add 2 or 3 quarts of transmission fluid into the fluid pan. Stop the process by releasing the air pressure and removing the air nozzle from the end of the hose.

9. **NOTE:** Engine idle speed is approximately 650 rpm.

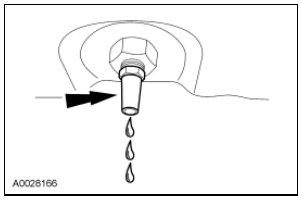
    Start and run the engine until the transmission fluid temperature is between 27°-49°C (80°-120°F).

10. Inspect the fluid level in the special tool. If the fluid drains back into the canister, the transmission is full. If no fluid drains back, more fluid will need to be added. Repeat Steps 8 and 9.

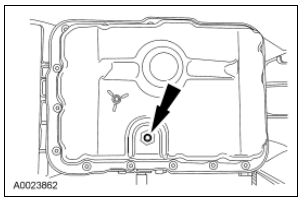
11. Once the transmission is full, place a hand vacuum pump on the open end of the vacuum/pressure hose of the special tool and apply vacuum to the system. This will pull out any extra fluid trapped in the system and direct it into the container.



12. Allow the fluid to drain. When the fluid comes out as a thin stream or drip, the fluid is at the correct level.



13. Reinstall the small (center) fluid level indicating plug using a 3/16-inch Allen key.
    - Tighten to 10 Nm (89 lb-in).



Transmission Fluid Cooler Backflushing and Cleaning

Printable View (20 KB)

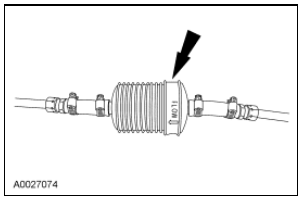
⚠ CAUTION: Whenever a transmission has been disassembled to install new parts or a new or remanufactured transmission has been installed, a new transmission fluid cooler (either in-tank, auxiliary or OTA) if equipped, will need to be installed. Using a suitable torque converter/fluid cooler cleaner, clean and backflush the transmission fluid cooler tubes.

⚠ CAUTION: Use only clean automatic transmission fluid specified for this transmission. Do not use supplemental fluid additives, treatments or cleaning agent. The use of these materials may affect transmission operation and result in internal damage to the transmission.

⚠ CAUTION: When internal wear or damage has occurred in the transmission, metal particles, clutch plate material, or band material may have been carried into the transmission fluid cooler. These contaminants are a major cause of recurring transmission concerns and must be removed from the system before the transmission is put back into use.

1. Carry out backflushing with a suitable torque converter/transmission fluid cooler cleaner. Test the equipment to make sure that a vigorous fluid flow is present before proceeding. Install a new system filter if flow is weak or contaminated.

2. If equipped, remove and discard the transmission fluid in-line filter.



3. To aid in attaching the cleaner to the transmission steel cooler lines, connect 2 additional rubber hoses to the transmission end of the steel transmission cooler lines as described.
   - Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).
   - Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

4. Turn on the pump and allow the clean transmission fluid to circulate a minimum of 5 minutes (cycling switch ON and OFF will help dislodge contaminants in cooler system).

5. Switch OFF the pump and disconnect the pressure hose from the transmission cooler return line.

6. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all fluid is removed.

7. Remove the rubber return hose from the remaining steel cooler line.

Transmission Range (TR) Sensor Adjustment

Printable View (224 KB)

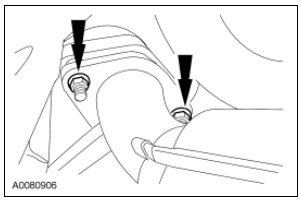
Special Tool(s)

ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)

Adjust

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Loosen the four converter-to-manifold nuts.

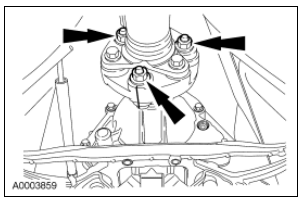


A0080906

3. **⚠ CAUTION: Index-mark (color paint) the bolts, washers, nuts and the flex coupling to the transmission flange to make sure they are installed in the same location. Components that are not assembled in their original locations can cause driveshaft imbalance.**

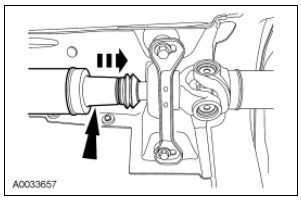
   ⚠ CAUTION: Do not remove the bolts retaining the flex coupling to the driveshaft.

   Index-mark the front driveshaft pinion flange. Remove the three nuts, washers and bolts.



A0003859

4. Slide the front shaft assembly rearward and support.

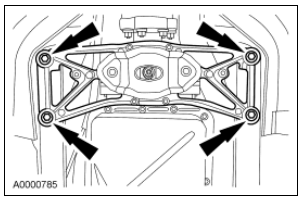


A0033657

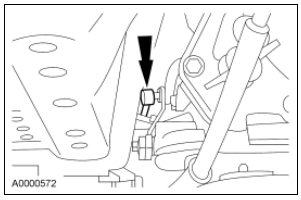
5. **⚠ WARNING: Secure the transmission to the transmission jack with a safety chain. Failure to follow these instructions may result in personal injury.**

   Using a suitable transmission jack, support the transmission.

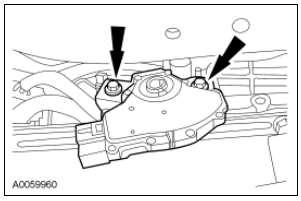
6. Remove the transmission mount and lower the transmission enough to gain access to the digital transmission range (TR) sensor.



7. Disconnect the shift cable from the manual control lever.



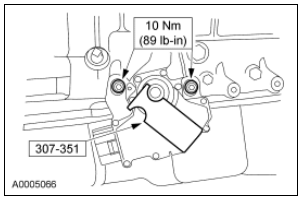
8. Loosen the screws.



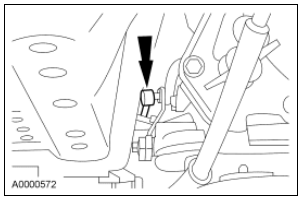
9. ⚠ **CAUTION: The digital TR sensor must fit flush against the case. Tightening one screw before tightening the other may cause the sensor to bind or become damaged.**

   Using the special tool, align the digital TR sensor and tighten the screws in an alternating sequence.

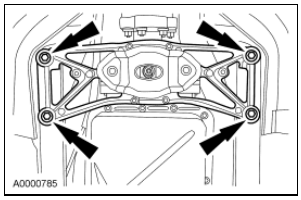
   - Tighten to 10 Nm (89-lb-in).



10. Install the shift cable to the manual control lever.

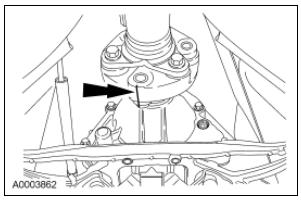


11. Raise the transmission up and install the rear transmission mount bolts. Remove the transmission jack.
    - Tighten to 55 Nm (41 lb-ft).



12. Verify that the shift cable is adjusted correctly. For additional information, refer to Section 307-05 .

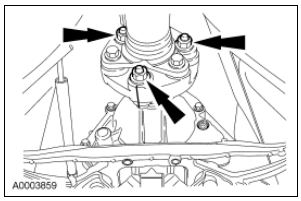
13. Install the driveshaft by aligning the index-marks made during removal for correct driveshaft balance.



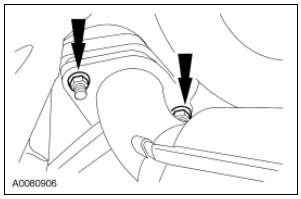
14. ⚠ **CAUTION: Install the bolts, washers, and nuts in their original position or driveshaft imbalance can occur. Install the driveshaft flex coupling bolts with the head of the bolt seated against the flange, and the nuts seated against the flex coupling.**

    Install the three nuts, washers and bolts.

    - Tighten to 81 Nm (60 lb-ft).



15. Install the four converter-to-manifold nuts.
    - Tighten to 40 Nm (40 lb-ft).



Torque Converter

Printable View (8 KB)

1. A new or remanufactured torque converter must be installed if one or more of the following statements is true:
    - A torque converter malfunction has been determined based on complete diagnostic procedures.
    - Converter stud or studs, impeller hub or bushing are damaged.
    - Discoloration (due to overheating).
    - Evidence of transmission assembly or fluid contamination due to the following transmission or converter failure Modes:
        - Major metallic failure.
        - Multiple clutches or clutch plate failures.
        - Sufficient component wear which results in metallic contamination.
        - Internal torque converter contamination present. For additional information, refer to Torque Converter Contamination Inspection in this section.

Torque Converter Contamination Inspection

Printable View (10 KB)

⚠ CAUTION: Do not use water-based cleaners or mineral spirits to clean or flush the torque converter or transmission damage will occur. Use only clean automatic transmission fluid designated for the transmission and converter being serviced.

⚠ CAUTION: The torque converter drain plug and seal are not reusable. If equipped, discard the drain plug and seal, then install a new drain plug assembly.

1. If a new or remanufactured torque converter is not being installed, the following steps must be completed.
2. With the torque converter on a bench, pour a small amount of transmission fluid from the torque converter onto an absorbent white tissue or through a paper filter and examine the fluid.
3. Observe the color and odor of the fluid. The fluid should be red, not brown or black. Odor may indicate an overheating condition such as clutch disc or band failure.
4. Examine the stain on the tissue for evidence of particles (spec of any kind). Examine the fluid level indicator for signs of antifreeze (gum or varnish). If particles are present in the fluid or there is evidence of engine coolant or water, a new torque converter must be installed.
5. If there are no particles or contamination present, drain the remainder of the transmission fluid from the torque converter.
6. Add 1.9 liter (2 qt) of clean automatic transmission fluid into the converter and agitate by hand.
7. Thoroughly drain the fluid.

Fluid Pan, Gasket and Filter

Printable View (188 KB)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Removal

⚠ CAUTION: Lubricate the fluid filter seals with clean automatic transmission fluid or they may be damaged.

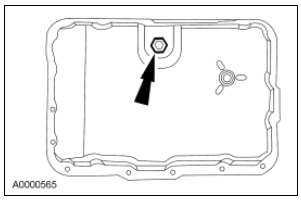
NOTE: Make sure that the fluid filter seals are correctly seated on the filter.

NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage. If not damaged, the gasket should be reused.

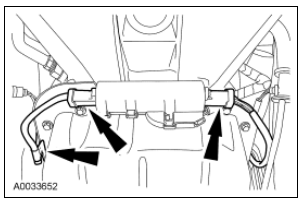
NOTE: Install a new transmission fluid filter.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

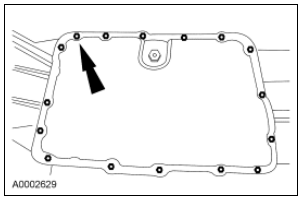
2. Remove the drain plug and drain the fluid.



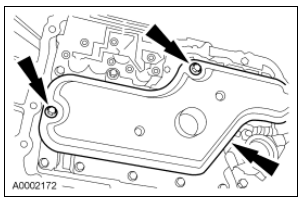
3. Remove the HO2S connectors retaining clips from the pan rails and position the connectors out of the way.



4. Remove the transmission fluid pan and gasket.

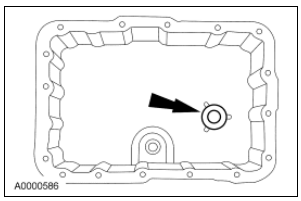


5. Remove and discard the transmission fluid filter.



Installation

1. Clean and inspect the transmission fluid pan and magnet.

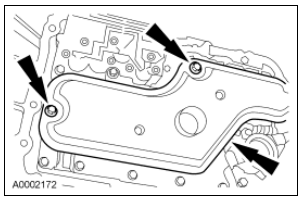


2. ⚠ **CAUTION: Lubricate the transmission fluid filter O-ring seals with clean automatic transmission fluid or the seals may be damaged.**

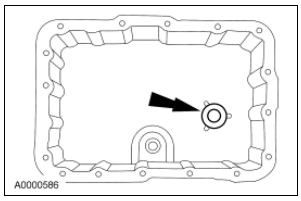
   NOTE: Make sure the transmission fluid filter seals are correctly seated on the filter.

   Lubricate the seals and install the transmission fluid filter and screws.

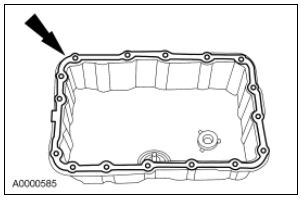
   - Tighten to 10 Nm (89 lb-in).



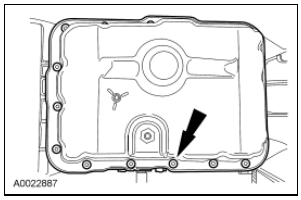
3. Install the fluid pan magnet in the transmission fluid pan.



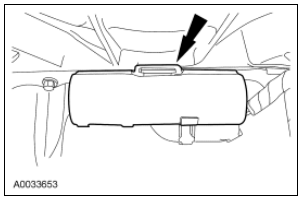
4. Install the transmission fluid pan and gasket and loosely install the screws.



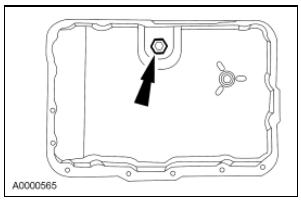
5. Using a crisscross pattern, tighten the screws.
   - Tighten to 10 Nm (89 lb-in).



6. Install the HO2S wire connector retainers on the transmission fluid pan rails and connect the sensors.



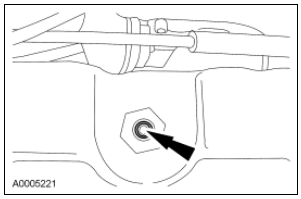
7. Install the drain plug.
   - Tighten to 26 Nm (19 lb-ft).



8. **NOTE:** It will be necessary to hold the drain plug with a wrench when removing the fluid level indicator plug.

   NOTE: Use a 3/16-Allen key to remove the fluid level indicator plug.

   Remove the fluid level indicator plug.



9. Carry out the fluid level check. Refer to Transmission Fluid Level Check in this section.

Main Control Valve Body

Printable View (618 KB)

Special Tool(s)

ST1639-A	Aligner, Valve Body (2 required) 307-334 (T95L-70010-C)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Removal

⚠ CAUTION: Lubricate the fluid filter seals with clean automatic transmission fluid or they may be damaged.

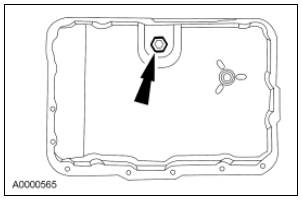
NOTE: Make sure that the fluid filter seals are correctly seated on the filter.

NOTE: Clean the area around the solenoid body connector contamination.

NOTE: The transmission fluid pan gasket is reusable. Clean and inspect for damage. If not damaged, the gasket should be reused.

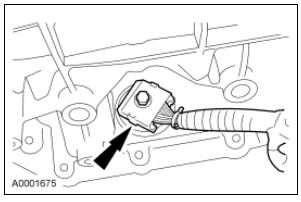
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Drain the transmission fluid.

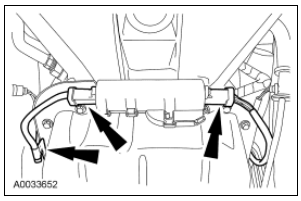


3. **NOTE:** Clean the area around the solenoid body connector to prevent contamination.

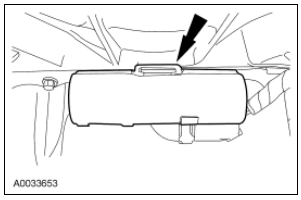
   Disconnect the solenoid body harness electrical connector.



4. Disconnect the HO2S connector and remove the sensor wire retaining clip from the right side of the transmission pan rail.

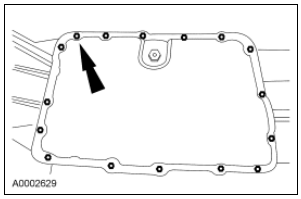


5. Remove the HO2S connector from the front of the transmission pan rail.

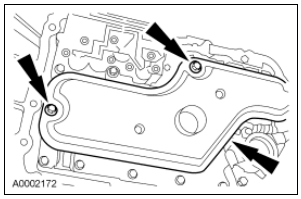


6. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect the gasket for damage. If not damaged, the gasket should be reused.

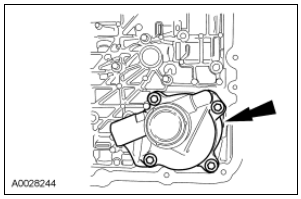
   Remove the transmission fluid pan and gasket.



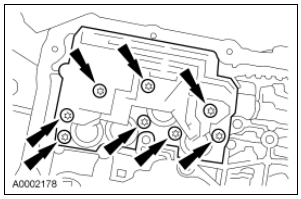
7. Remove the transmission fluid filter



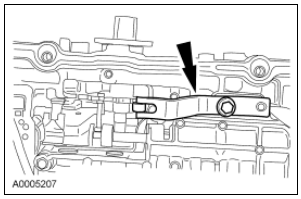
8. Remove the 4 screws attaching the reverse servo to the transmission case and remove the servo.



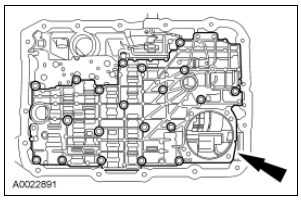
9. Remove the screws and the solenoid body.



10. Remove the manual control valve detent spring.

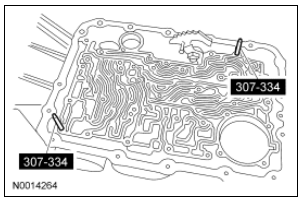


11. Remove the main control valve body bolts, main control valve body, separator plate and gasket.

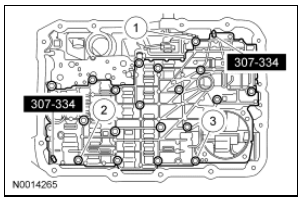


Installation

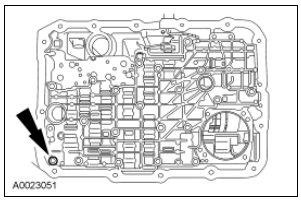
1. Install the special tools into the transmission case.



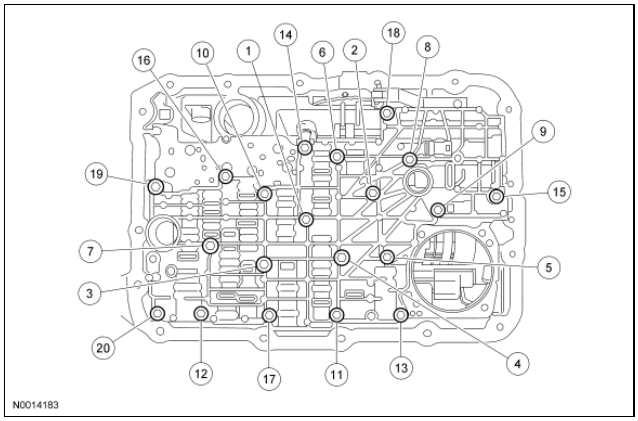
2. Using the special tools, install the main control valve body and loosely install the screws.
    1. Install the short screw.
    2. Install the screw with the larger head.
    3. Install the remaining screws.



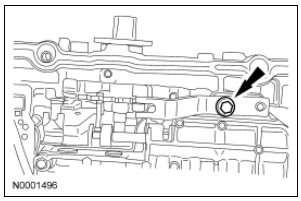
3. Remove the special tools, and loosely install the screw.



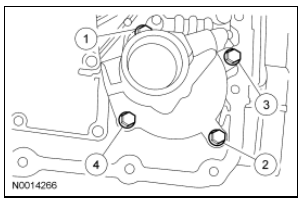
4. Tighten the screws in the sequence shown.
    - Tighten to 10 Nm (89 lb-in).



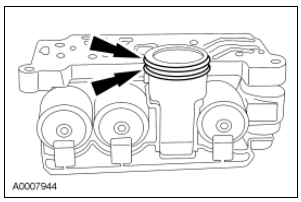
5. Install the manual control valve detent spring.
    - Tighten to 10 Nm (89 lb-in).



6. Install the reverse servo and the 4 screws in 2 stages, in the sequence shown.
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 10 Nm (89 lb-in).



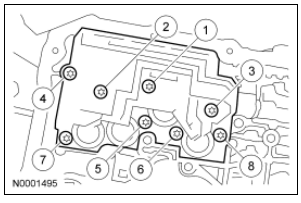
7. Install new O-ring seals on the solenoid body connector. Lubricate the O-ring seals with clean automatic transmission fluid.



8. ⚠ **CAUTION: Inspect the transmission case bore to make sure it is free of foreign material and not damaged. If it is damaged, transmission leak may occur.**

    Install the solenoid body. Tighten the screws in sequence shown.

    - Tighten to 8 Nm (71 lb-in).

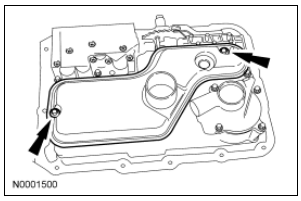


9. ⚠ **CAUTION: Lubricate the fluid filter seals with clean automatic transmission fluid or they may be damaged.**

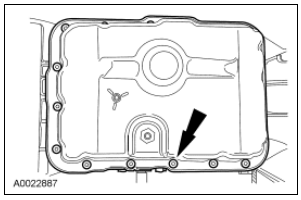
   NOTE: Make sure that the fluid filter seals are correctly seated on the filter.

   Lubricate the seals and install the transmission fluid filter.

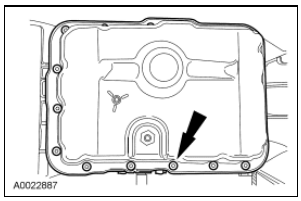
   - Tighten to 10 Nm (89 lb-in).



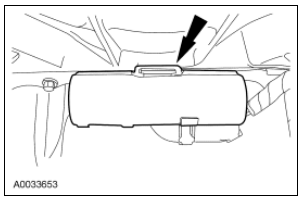
10. Install the transmission fluid pan and gasket and loosely install the screws.



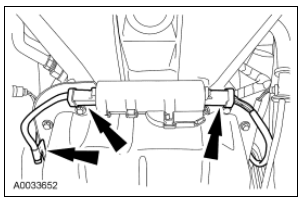
11. Tighten the screws in a crisscross sequence.
    - Tighten to 10 Nm (89 lb-in).



12. Install the HO2S connector to the front of the transmission pan rail.



13. Connect the HO2S connector and install the sensor wire retaining clip to the right side of the transmission pan rail.



14. ⚠ **CAUTION: Damage will occur to the solenoid body assembly if the screw is tightened above specification.**

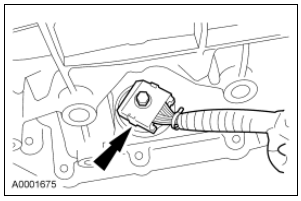
NOTE: Always install new O-ring seals on the vehicle harness connector.

NOTE: Clean the area around the connector to prevent contamination of the solenoid body connector.

NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

Install and lubricate new O-ring seals on the transmission connector and connect the connector.

- Tighten to 5 Nm (44 lb-in).



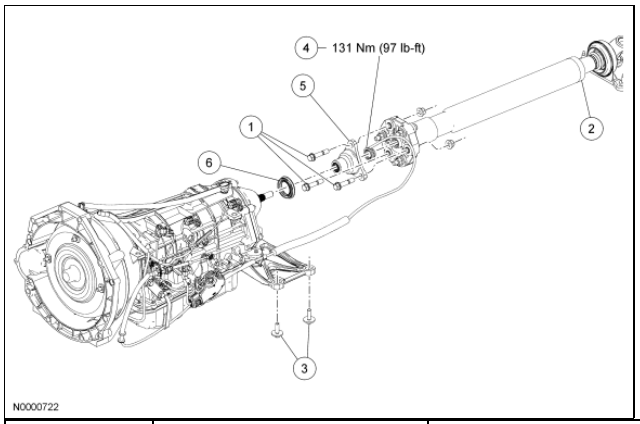
15. Fill the transmission to the correct level. For additional information, refer to Transmission Fluid Drain and Refill - Without Torque Converter Drain Plug in this section.

Extension Housing Seal

Printable View (240 KB)

Special Tool(s)

 ST1185-A	Slide Hammer 100-001 (T50T-100-A)
 ST1758-A	Remover, Torque Converter Fluid Seal 307-309 (T94P-77001-BH)
ST1188-A	Installer, Transmission Extension Housing Oil Seal 307-038 (T74P-77052-A)
 ST2440-A	Installer, Drive Pinion Flange 205-479
ST2416-A	Installer, Output Shaft Flange 307-404
 ST2415-A	Remover, Output Shaft Flange 307-523



Item	Part Number	Description
1	W701357-S309	Output shaft flange coupler bolts
2	4602	Driveshaft
3	W704971-S426	Transmission support screws
4	7089	Output shaft flange nut
5	7089	Output shaft flange
6	7052	Extension housing seal

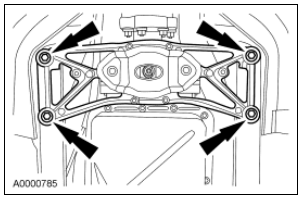
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

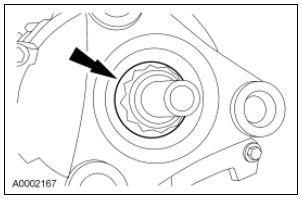
2. Remove the driveshaft. For additional information, refer to Section 205-01 .

3. Using a suitable transmission jack, support the transmission.

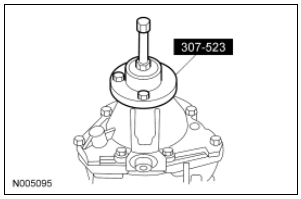
4. Remove the transmission mount and lower the transmission enough to gain access to the extension housing seal.



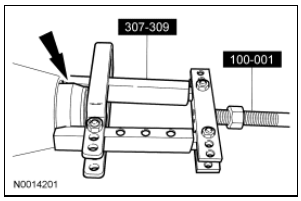
5. Remove and discard the nut.



6. Using the special tool, remove the output shaft flange.



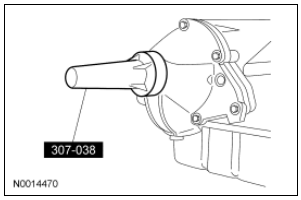
7. Using the special tools, remove and discard the extension housing seal.



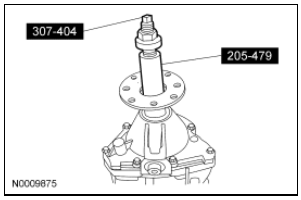
Installation

1. **NOTE:** Make sure the extension housing seal is correctly installed onto the special tool and the garter spring is in the correct position.

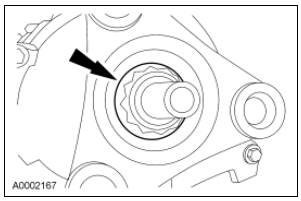
   Using the special tool, install the new extension housing seal.



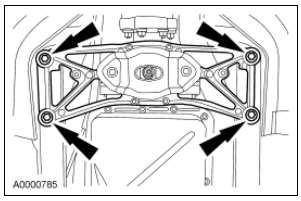
2. Using the special tools, install the output flange.



3. Install a new nut.
    - Tighten to 131 Nm (97 lb-ft).



4. Install the rear support screws.
    - Tighten to 55 Nm (41 lb-ft).



5. Install the driveshaft. For additional information, refer to Section 205-01 .

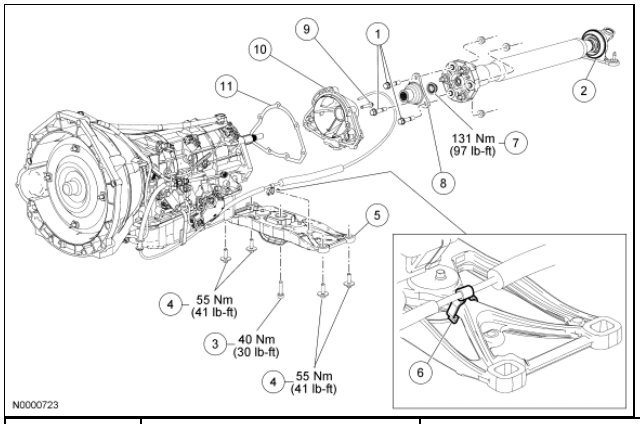
6. Check the transmission fluid level. For additional information, refer to Transmission Fluid Level Check in this section.

Extension Housing Gasket

Printable View (360 KB)

Special Tool(s)

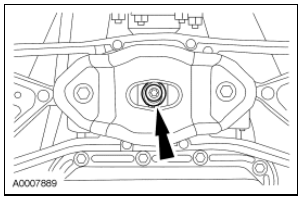
 ST2440-A	Installer, Drive Pinion Flange 205-479
ST2416-A	Installer, Output Shaft Flange 307-404
 ST2415-A	Remover, Output Shaft Flange 307-523



Item	Part Number	Description
1	W701357-S309	Output shaft flange coupler bolts
2	4602	Driveshaft
3	W705966-S426	Transmission support center screw
4	W704971-S426	Transmission support screws
5	6A023	Transmission support
6	7E395	Shift cable
7	W701357-S309	Output shaft flange nut
8	7089	Output shaft flange
9	W500311-S1427	Extension housing screws
10	7A039	Extension housing
11	7086	Extension housing gasket

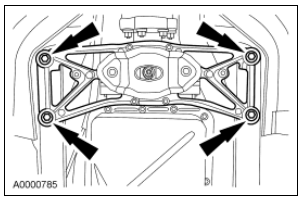
Removal

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the driveshaft. For additional information, refer to Section 205-01 .
3. Remove the transmission insulator center screw.

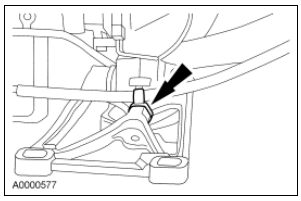


4. **NOTE:** Use a suitable transmission jack to support the transmission.

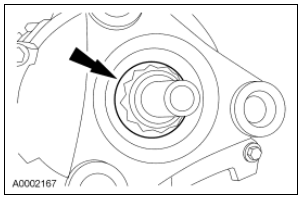
   Remove the 4 rear transmission crossmember screws.



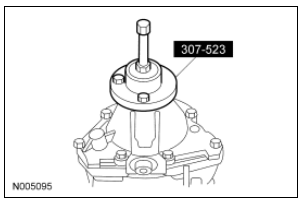
5. Disconnect the shift cable retainer and position the cable aside.



6. Remove and discard the nut.

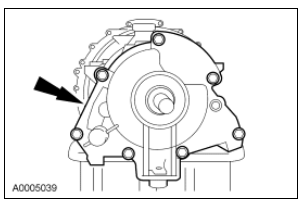


7. Using the special tool, remove the output shaft flange.

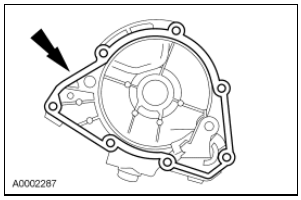


8. ⚠ **CAUTION: The parking pawl, parking pawl return and parking pawl shaft could fall out during removal of the extension housing.**

   Remove the 7 extension housing screws and the extension housing.



9. Remove and discard the extension housing gasket.



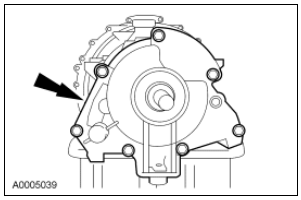
Installation

1. Clean the extension housing and install a new extension housing gasket. Make sure the park pawl is installed correctly.

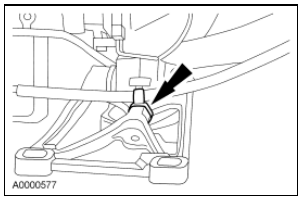
2. ⚠ **CAUTION: Make sure the parking lever actuating rod is correctly seated into the case parking rod guide cup.**

   Install the extension housing and screws.

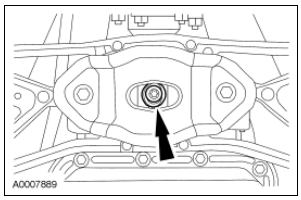
   - Tighten to 25 Nm (18 lb-ft).



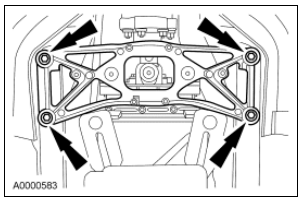
3. Install the shift cable retainer.



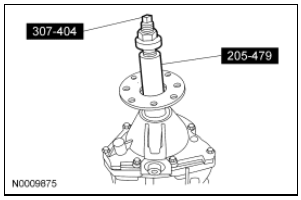
4. Install the rear transmission mount center screw.
   - Tighten to 40 Nm (30 lb-ft).



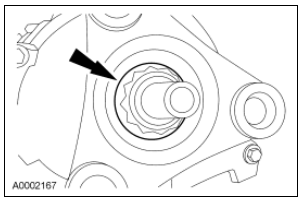
5. Install the 4 screws and the rear transmission support.
   - Tighten to 55 Nm (41 lb-ft).



6. Using the special tools, install the output flange.



7. Install a new nut.
    - Tighten to 131 Nm (97 lb-ft).



8. Install the driveshaft. For additional information, refer to Section 205-01 .

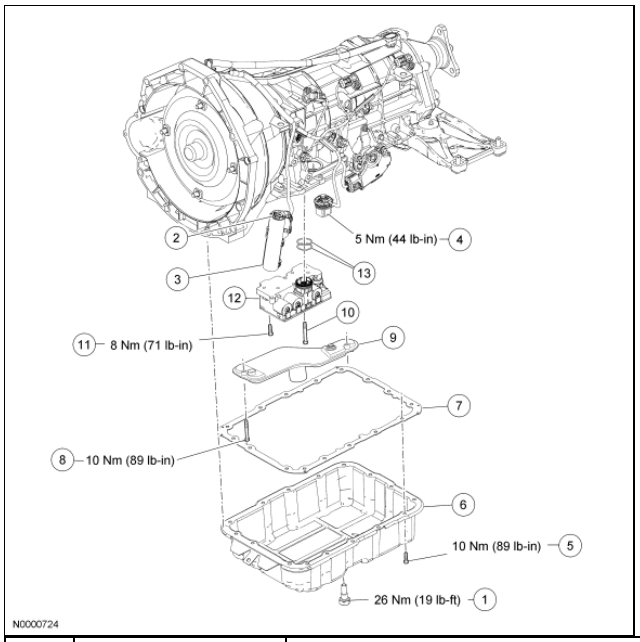
9. Check the transmission fluid level. For additional information, refer to Transmission Fluid Level Check in this section.

Solenoid Body Assembly

Printable View (349 KB)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V



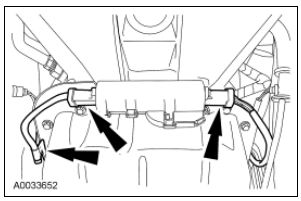
Item	Part Number	Description
1	7A194	Transmission fluid pan drain plug
2		Heated oxygen sensor (HO2S) electrical connector (part of 9F472)
3		HO2S electrical connector retainer
4	7E395	Solenoid body harness electrical connector
5	W500213-S1309	Transmission fluid pan screws
6	7A194	Transmission fluid pan
7	7A191	Transmission fluid pan gasket
8	W70559-S300	Transmission fluid pan filter screws
9	7A098	Transmission fluid pan filter
10	W703189-S1430	Solenoid body screws
11	W702291-S300	Solenoid body screw
12	7G391	Solenoid body
13	W705928-S300	Solenoid body O-ring seals

Removal

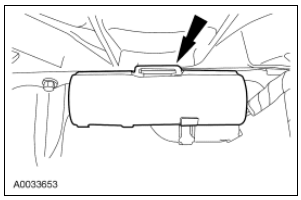
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the transmission fluid pan drain plug and drain the transmission.

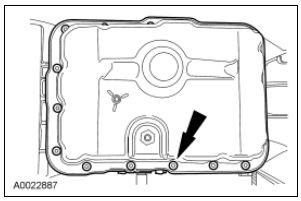
3. Disconnect the HO2S connector and remove the sensor wire retaining clip from the right side of the transmission pan rail.



4. Remove the HO2S connector from the front of the transmission pan rail.

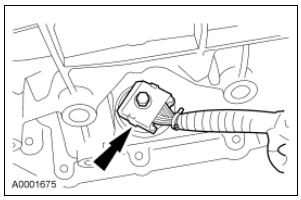


5. Remove the transmission fluid pan screws, gasket and fluid pan.

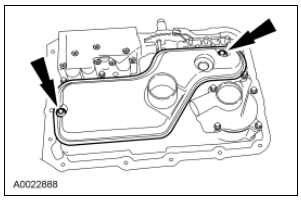


6. **NOTE:** Clean the area around the solenoid body connector to prevent contamination.

   Disconnect the solenoid body harness electrical connector.

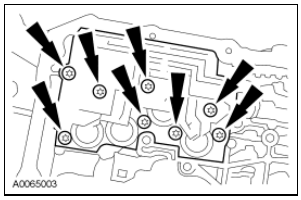


7. Remove the screws and the transmission fluid filter.



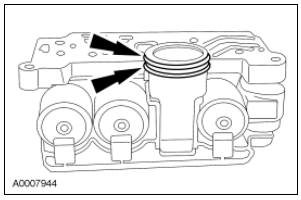
8. ⚠ **CAUTION: Do not damage the solenoid body connector pins.**

   Remove the solenoid body boles and remove the solenoid body by lifting on the body and pushing the connector from the other side of the case.



Installation

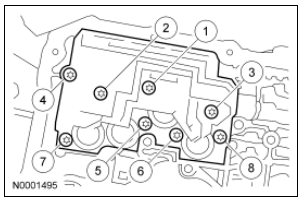
1. Install new O-ring seals on the solenoid body connector. Lubricate the O-ring seals with clean automatic transmission fluid.



2. ⚠ **CAUTION: Inspect the transmission case bore to make sure it is free of foreign material and not damaged. If it is damaged, transmission leaks may occur.**

   Install the solenoid body. Tighten the screws in the sequence shown.

   - Tighten to 8 Nm (71 lb-in).

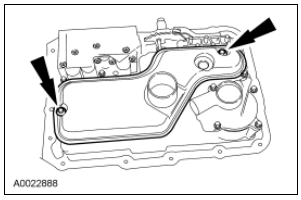


3. ⚠ **CAUTION: Lubricate the fluid filter seals with clean automatic transmission fluid or they may be damaged.**

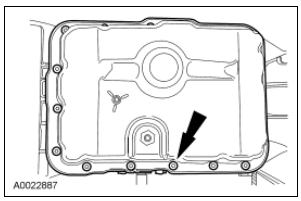
   NOTE: Make sure the fluid filter seals are correctly seated on the filter.

   Lubricate the seals and install the transmission fluid filter.

   - Tighten to 10 Nm (89 lb-in).



4. Install the transmission fluid pan and gasket and loosely install the screws.



5. Tighten the screws in a crisscross pattern.
    - Tighten to 10 Nm (89 lb-in).

6. ⚠ **CAUTION: Damage will occur to the solenoid body assembly if the screw is tightened above specification.**

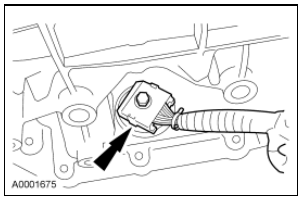
   NOTE: Always install new O-ring seals on the vehicle harness connector.

   NOTE: Clean the area around the connector to prevent contamination of the solenoid body connector.

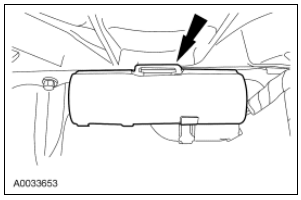
   NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

   Install and lubricate new O-ring seals on the transmission connector and connect the connector.

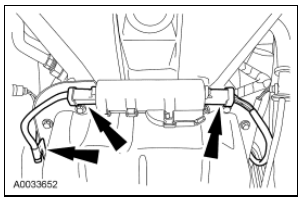
    - Tighten to 5 Nm (44 lb-in).



7. Install the HO2S connector from the front of the transmission pan rail.



8. Connect the HO2S connector and install the sensor wire retaining clip to the right side of the transmission pan rail.

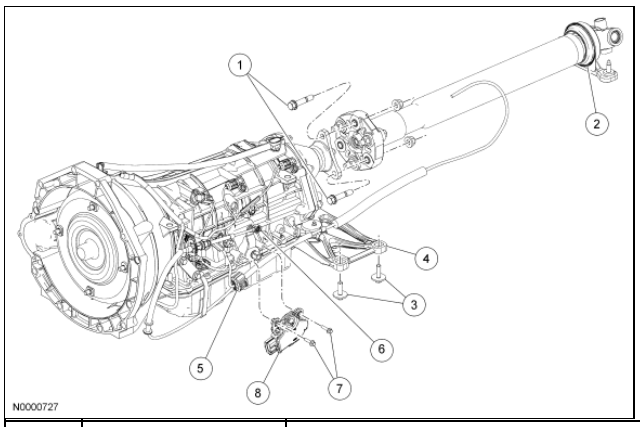


Digital Transmission Range (TR) Sensor

Printable View (306 KB)

Special Tool(s)

ST1633-A	Alignment Gauge, TR Sensor 307-351 (T97L-70010-A)



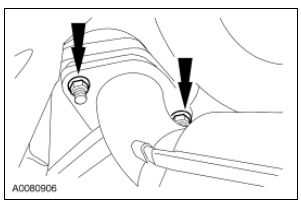
Item	Part Number	Description
1	W701357-S309	Output shaft flange coupler
2	4817	Driveshaft
3	W704971-S426	Transmission support screws
4	6A023	Transmission support
5	14A646	Transmission range TR sensor electrical connector
6	7E395	Transmission range selector lever eyelet
7	W500015-309	Transmission range TR sensor screws
8	7F293	Transmission range TR sensor

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the driveshaft. For additional information, refer to Section 205-01 .

3. Loosen the 4 converter-to-manifold nuts.
   - To install, tighten to 40 Nm (30 lb-ft).

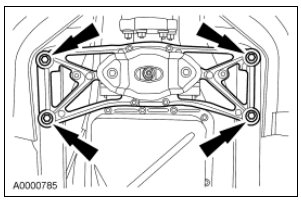


4. ⚠ **WARNING: Secure the transmission to the transmission jack with a safety chain. Failure to**

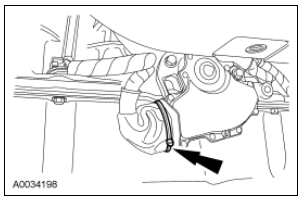
follow these instructions may result in personal injury.

Using a suitable transmission jack, support the transmission.

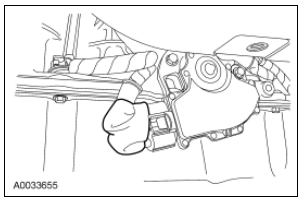
5. Remove the transmission mount crossmember and lower the transmission enough to gain access to the digital transmission range (TR) sensor.
    - To install, tighten to 55 Nm (41 lb-ft).



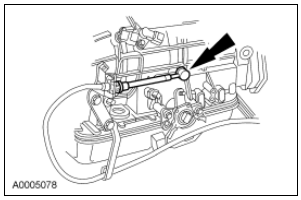
6. Remove and discard the tie strap from the digital TR sensor connector boot.



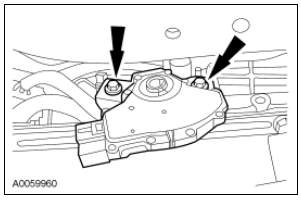
7. Slide the rubber boot back and disconnect the digital TR sensor connector.



8. Disconnect the transmission shift cable from the manual control lever.



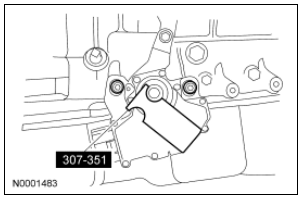
9. Remove the screws the digital TR screws and remove the digital TR sensor.
    - To install, alternately tighten to 10 Nm (89 lb-in).



10. ⚠ **CAUTION: The digital transmission range sensor must fit flush against the boss on the case to prevent damage to the sensor.**

    NOTE: The manual lever must be in the NEUTRAL position when installing the digital TR.

Using the special tool, align the digital TR sensor.

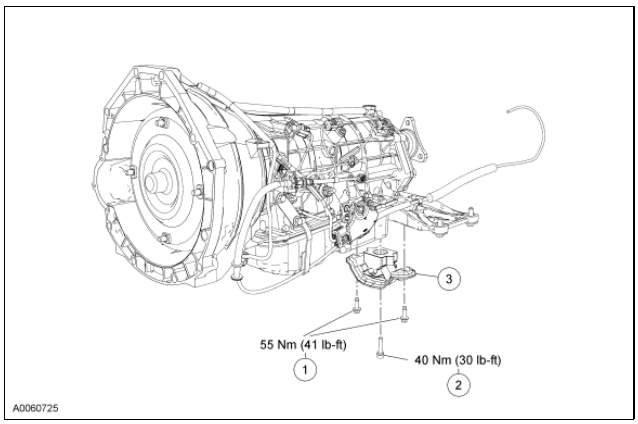


11. To install, reverse the removal procedure.

12. Verify that the shift cable is adjusted correctly. For additional information, refer to Section 307-05 .

Transmission Support Insulator

Printable View (159 KB)



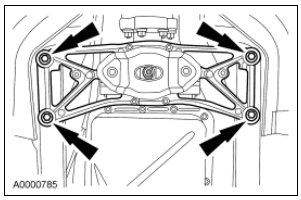
Item	Part Number	Description
1	W704971-S426	Rear transmission mount outer screw
2	W705966-S426	Rear transmission mount center screw
3	6038B	Rear transmission mount

Removal and Installation

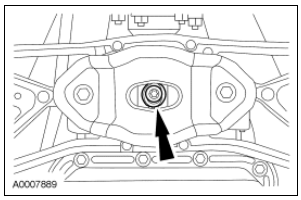
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Support the transmission with a transmission jack.

3. Remove the rear transmission mount outer screws.
   - To install, tighten to 55 Nm (41 lb-ft).



4. Remove the rear transmission mount center screw.
   - To install, tighten to 40 Nm (31 lb-ft).

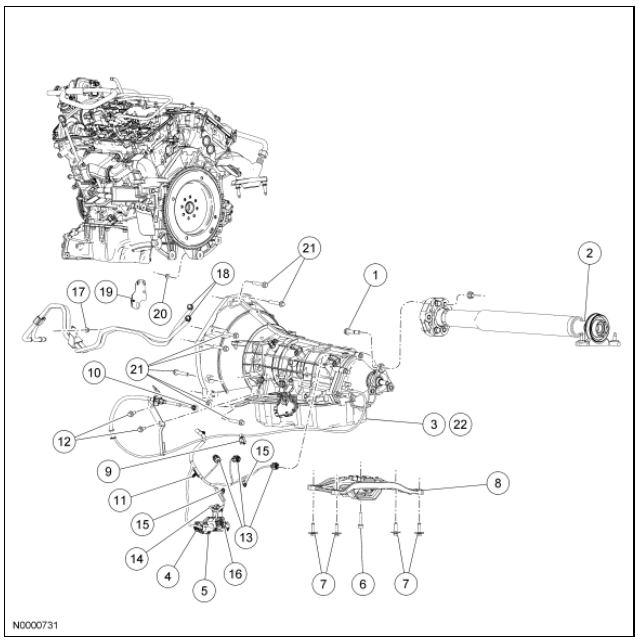


5. Remove the rear transmission mount.

6. To install, reverse the removal procedure.

Transmission

Printable View (726 KB)



Item	Part Number	Description
1	W701357-S309	Output shaft flange coupler
2	4817	Driveshaft
3	7000	Transmission assembly
4	9F472	Heated oxygen sensor electrical connector
5	9F472	Heated oxygen sensor electrical connector retainer
6	W705966-S426	Transmission support center screw
7	W704971-S426	Transmission support outer screws
8	6A023	Transmission support
9	7E395	Cable retainer
10	7E395	Transmission selector lever cable eyelet
11		Wire harness retainer
12	7B229	Transmission selector lever cable screws and bracket
13	14A464	Speed sensor connector
14	7C078	Solenoid body harness electrical connector
15	14A464	Wire harness retainers
16	14A646	Transmission range TR sensor electrical connector
17	7A030	Fluid cooler tube bracket
18	7A030	Fluid cooler tube nuts
19	6C070	Torque converter access cover
20	W705443-S	Torque converter nuts
21	W500128-S	Bell housing screws
22	7000	Transmission assembly

⚠ WARNING: Secure the transmission to the transmission jack with a safety chain. Failure to follow these instructions can result in personal injury.

NOTE: When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer needs to be notified that they can experience slightly different upshifts either (soft or firm) and that this is a temporary condition and will eventually return to normal operating condition.

NOTE: If transmission disassembly or installation of a new transmission is necessary, drain the transmission fluid. Install the drain plug when finished.

NOTE: If the transmission is to be removed for an extended period of time, support the engine with a safety stand and a wood block.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

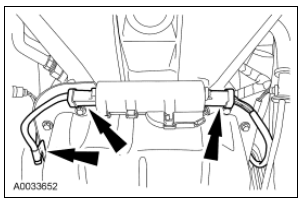
3. Remove the complete exhaust system and front heat shields. For additional information, refer to Section 309-00 .

4. Remove the driveshaft. For additional information, refer to Section 205-01 .

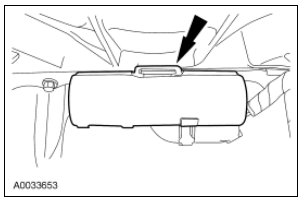
5. ⚠ **WARNING: Secure the transmission to the transmission jack with a safety chain. Failure to follow these instructions may result in personal injury.**

   Using a suitable transmission jack, support the transmission.

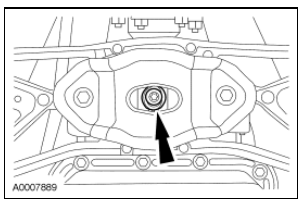
6. Disconnect the heated oxygen sensor connector and remove the sensor wire retaining clip from the right side of the transmission pan rail.



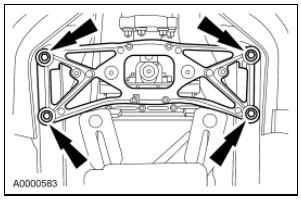
7. Remove the heated oxygen sensor connector from the front of the transmission pan rail.



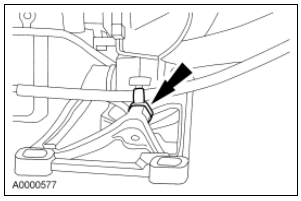
8. Remove the transmission support center screw.



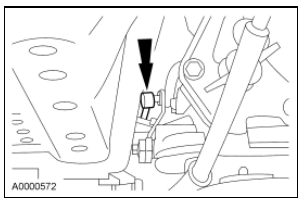
9. Remove the transmission support outer screws and remove the rear transmission support.



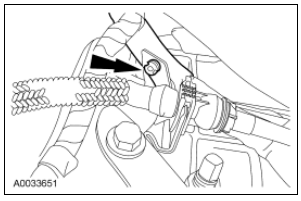
10. Disconnect the transmission shift cable retainer and position it aside.



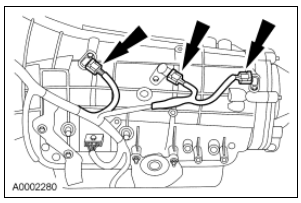
11. Disconnect the transmission shift cable eyelet from the manual lever.



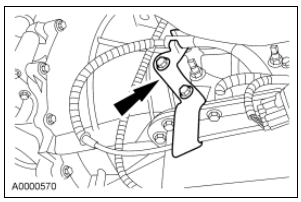
12. Disconnect the wire harness from the top of the transmission shift cable bracket.



13. Lower the transmission enough to gain access to the sensors. Disconnect the turbine shaft speed (TSS) sensor, output shaft speed (OSS) sensor and intermediate shaft speed (ISS) sensor electrical connectors.

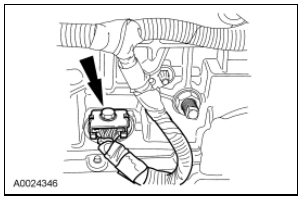


14. Remove the transmission shift cable bracket screws and bracket.

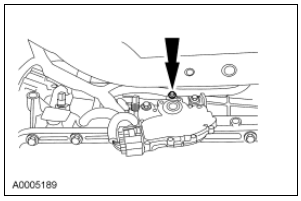


15. **NOTE:** Clean the area around connector to prevent contamination of the solenoid body connector.

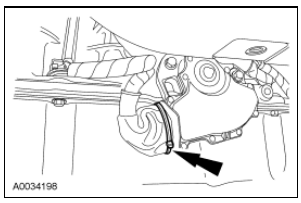
    Remove the screw from the solenoid body connector and disconnect the connector.



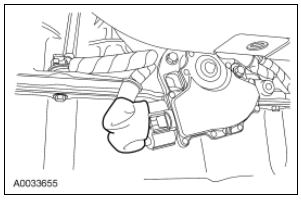
16. Disconnect the wire harness retainers.



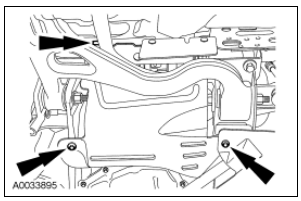
17. Remove and discard the tie strap from the digital TR sensor connector boot.



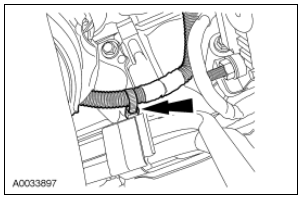
18. Slide the rubber boot back and disconnect the digital TR sensor connector.



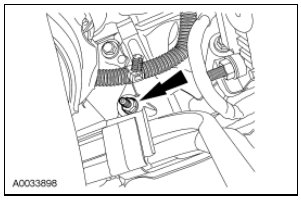
19. Remove the screws and pushpins, then remove the splash shield.



20. Disconnect the wire harness from the cooler line bracket.

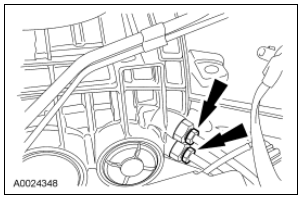


21. Disconnect the transmission cooler line bracket.

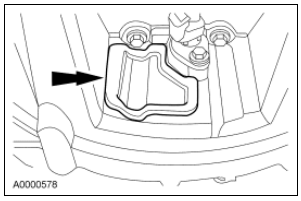


22. ⚠ **CAUTION: Do not damage the cooler tubes. Hold the transmission case fittings with a wrench.**

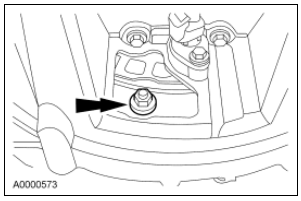
    Disconnect the transmission cooler tubes.



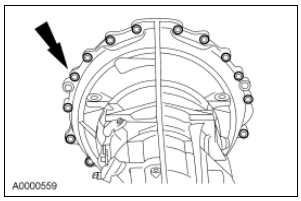
23. Remove the access cover.



24. Remove the torque converter nuts.



25. Remove the transmission bellhousing-to-engine screws.



26. Carefully lower the transmission from the vehicle. Make sure the transmission fluid cooler and cooler lines are cleaned at this time.
    - Carry out the transmission fluid cooler backflushing and cleaning if the transmission is being overhauled or installing a new or remanufactured transmission. For additional information, refer to Transmission Fluid Cooler Backflushing and Cleaning in this section.

84	7C498	Reverse brake drum and clutch assembly (includes OWC)
85	7D095	Low/reverse band assembly
86	7B368	Output shaft thrust washer No. 11
87	7C058	Deflector assembly
88	7A233	Transmission parking gear assembly
89	7060	Output shaft
90	7A441	Parking pawl
91	7D070	Parking pawl return spring
92	7D071	Parking pawl shaft
93	7086	Extension housing gasket
94	7A039	Extension housing

95	W500311-S309	M8 x 1.25 extension housing to case screw (5 required)
96	7052	Extension housing seal
97	7089	Output shaft flange
98	W701357-S309	Output shaft flange nut
99	7D273	Fluid tube connector assembly (2 required)
100	7H074	Ring overdrive servo retainer
101	W703119-S300	Overdrive servo cover seal (2 required)
102	7D027	Overdrive servo cover
103	7D021	Overdrive servo piston and rod
104	7D028	Intermediate/overdrive servo piston spring (2 required)
105	W702777-S300	Ring intermediate servo retainer
106	W702969-S300	Intermediate servo cover seal
107	7D027	Intermediate servo cover
108	7D021	Intermediate servo piston and rod
109	7005	Case assembly
110	7034	Case vent assembly
111	W708389-S426	Speed sensor-to-case screw (M6 x 19)
112	7H103	Output shaft speed, turbine shaft speed and intermediate shaft speed sensors
113	W702981-S300	Speed sensor-to-case O-ring seal
114	7A179	Reverse brake drum lever
115	7D433	Reverse band actuating lever shaft
116	7A232	Parking pawl actuating rod
117	390318-S2	Pipe plug
118	W703001-S309	Manual lever shaft outer and inner nut
119	7A115	Manual valve inner lever
120	7B498	Manual control lever seal
121	7A256	Manual control lever
122	7F293	Digital transmission range (TR) sensor
123	W500015-S309	Digital transmission range (TR) sensor screw and washer (2 required)
124	6026	Fluid fill plug
125	7B210	Manual lever shaft pin retainer
126	7B193	Reverse servo assembly
127	7D372	Reverse servo plate
128	7D466	Reverse servo accumulator spring
129	7D189	Reverse servo piston and seal
130	7423	Reverse servo piston O-ring seal
131	7D036	Reverse servo cover
132	W702359-S309	Reverse servo piston-to-case screw (4 required)
133	7D321	Control valve spring retainer
134	7A270	Main fluid pressure spring regulator valve

135	7D488	Reverse servo check valve
136	W701099-S1430	Main control valve body separating plate screw
137	7Z490	Main control valve body separating plate (bonded)
138	7A101	Lower main control valve body
139	W500102-S1300	Main control valve body screws (18 required)
140	W702791-S300	Main control valve body screws (1 required)
141	7E332	Manual valve detent spring
142	W500100-S300	Screw detent spring
143	W706672-S300	Main control valve body screws (1 required)
144	7A100	Main control valve body
145	W705928-S300	Solenoid body connector O-ring seal
146	7G391	Transmission control solenoid body
147	W702921-S300	Transmission control solenoid body screw
148	W703189-S430	Transmission control solenoid body screws (7 required)
149	7A098	Transmission fluid pan filter
150	W705559-S300	Transmission fluid pan filter screws
151	7L027	Transmission fluid pan magnet
152	7A191	Transmission fluid pan gasket
153	7A194	Transmission fluid pan
154	7A010	Transmission fluid pan drain tube
155	W500213-S1309	Transmission fluid pan screw
156	W704999-S309	Transmission fluid pan drain tube plug (short hex)
A		Overdrive/coast clutch assembly
B		Direct clutch assembly
C		Forward clutch assembly

⚠ CAUTION: The screws are not reusable for assembly. Discard the screws. If the screws are reused, the housing may become separated from the transmission.

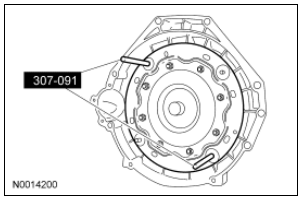
NOTE: The transmission fluid pan gasket is reusable. Clean and inspect the gasket for damage. If not damaged, the gasket should be reused.

NOTE: Tag and identify all parts for reassembly.

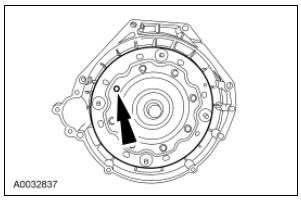
1. **⚠ WARNING: The torque converter is heavy, especially when full of fluid.**

   NOTE: If not installing a new torque converter, leave the adapter plate screwed to the torque converter.

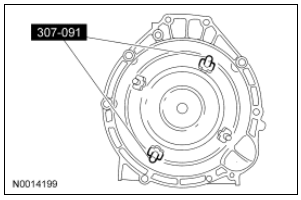
   Using the special tools, remove the torque converter and adapter plate as an assembly.



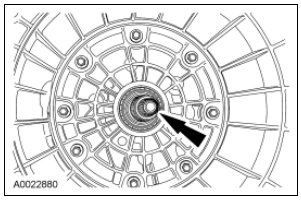
2. If the vehicle is equipped, and installation of a new or remanufactured torque converter is necessary, remove the torque converter adapter plate.



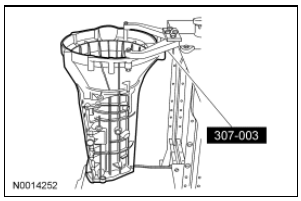
3. If the adapter plate has been removed, use the special tools to remove the torque converter.



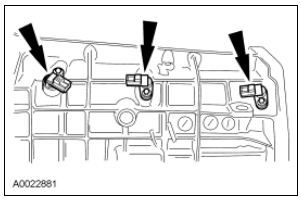
4. Remove the input shaft.



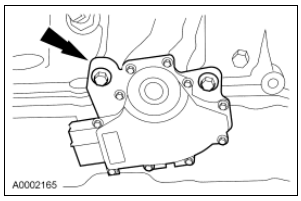
5. Using the special tool, install the transmission into the bench with the torque converter housing facing up.



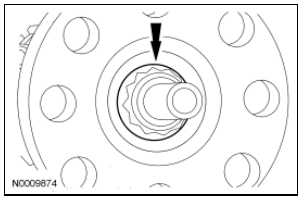
6. Remove the transmission sensors.



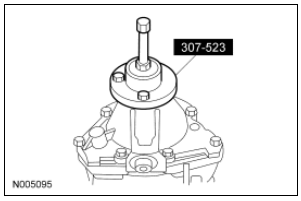
7. Remove the transmission range senor.



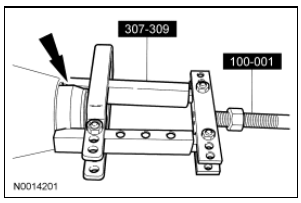
8. Remove and discard the nut.



9. Using the special tool, remove the output shaft flange.

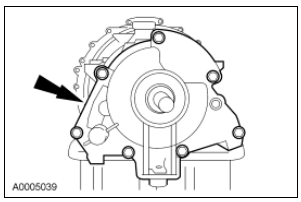


10. Using the special tools, remove the extension housing seal.

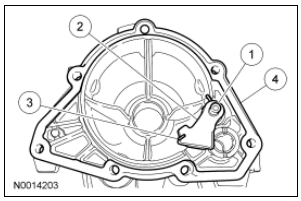


11. ⚠ **CAUTION: The parking pawl, parking pawl return spring and parking pawl shaft could fall out during removal of the extension housing.**

    Remove the extension housing.

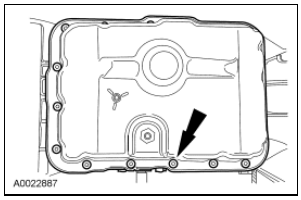


12. Remove the parking pawl assembly and discard the gasket.
    1. Remove the parking pawl shaft.
    2. Remove the parking pawl.
    3. Remove the parking pawl return spring.
    4. Remove and discard the gasket.

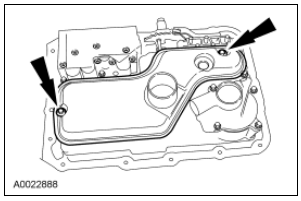


13. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect the gasket for damage. If the gasket is not damaged, the gasket should be reused.

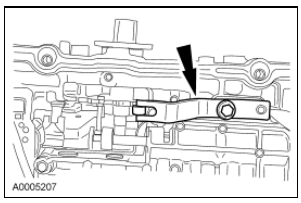
    Remove the transmission fluid pan and gasket.



14. Remove the transmission fluid filter and discard.

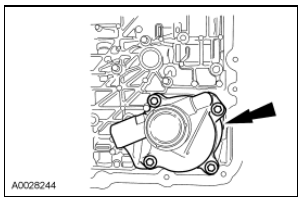


15. Remove the manual control valve detent spring.



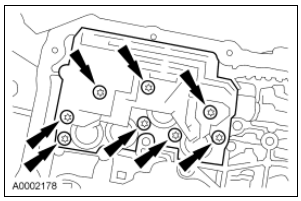
16. ⚠ **WARNING: The upper and lower servo covers are under spring tension. Use care when removing the piston and cover assembly. Failure to follow these instructions may result in personal injury.**

    Remove the reverse servo assembly.

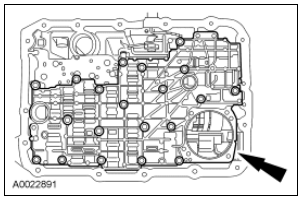


17. ⚠ **CAUTION: Do not damage solenoid body connector pins.**

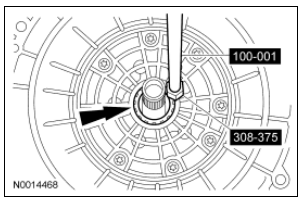
    Remove the solenoid body assembly by lifting on the body and pushing the connector from the other side of the case.



18. Remove the main control valve body, separator plate and gasket.



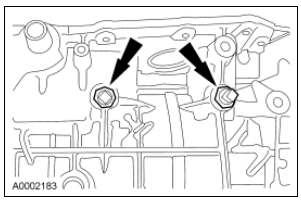
19. Using the special tools, remove the converter hub seal.



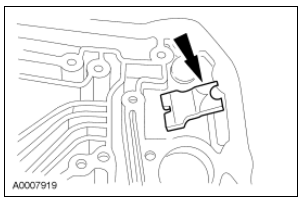
20. **⚠ CAUTION: Failure to loosen the OD band adjusting screw prior to pump removal may cause damage to the pump and OD band.**

    ⚠ CAUTION: Throw the locknuts away. The locknuts are not reusable for assembly.

    Remove the locknuts, and loosen the OD band adjusting screw.

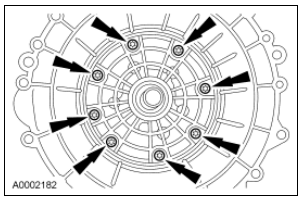


21. Remove and tag part for assembly.

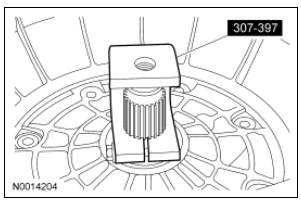


22. **⚠ CAUTION: The screws are not reusable for assembly. Discard the screws. If the screws are reused, the housing may become separated from the transmission.**

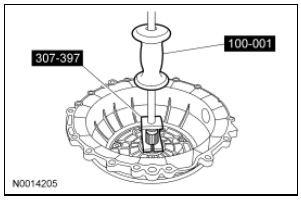
    Remove and discard the screws.



23. Install the special tool.

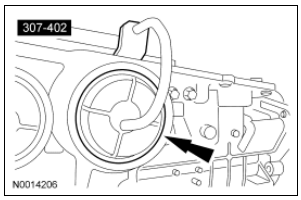


24. Using the special tools, remove the pump.

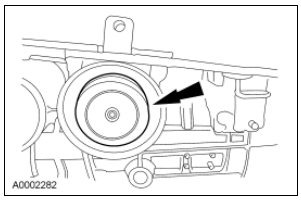


25. ⚠ **CAUTION: Servo cover is under spring tension.**

    Using the special tool, remove the intermediate servo cover retaining ring.

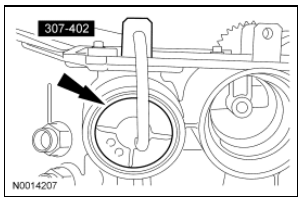


26. Remove the intermediate band servo piston and spring.

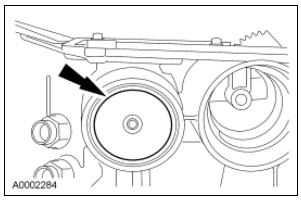


27. ⚠ **CAUTION: Servo cover is under spring tension.**

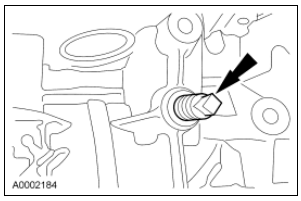
    Using the special tool, remove the overdrive servo cover retaining ring and cover.



28. Remove the front band servo piston and spring.

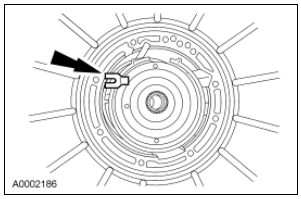


29. Remove the screw.



30. **NOTE:** Tag and identify parts for reassembly.

Compress the overdrive band and remove the apply strut.

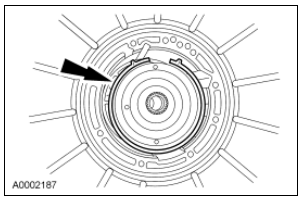


31. ⚠ **CAUTION: Identify the anchor and apply ends of the overdrive band.**

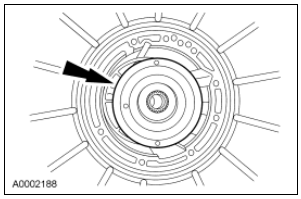
NOTE: The new overdrive band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

Remove and inspect the overdrive band. Check the following conditions for installing a new band:

- Inspect for glazing.
- Inspect for missing friction material.
- Inspect for material flaking.
- Inspect for damage to the anchor pins.



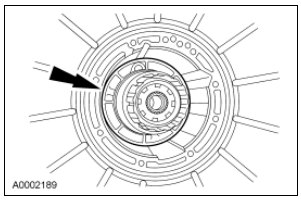
32. Remove the overdrive brake and coast clutch drum.



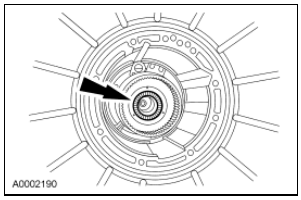
33. ⚠ **CAUTION: Do not bend the trigger wheel.**

NOTE: The No. 12 thrust bearing is in this assembly.

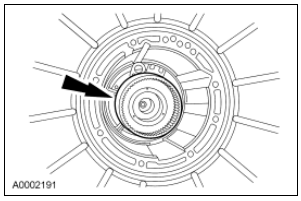
Remove the planetary gear overdrive carrier.



34. Remove the No. 2 overdrive planet thrust bearing.

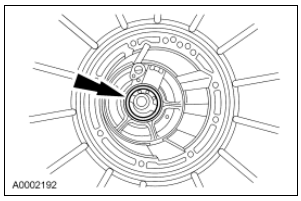


35. Remove the overdrive ring gear, overdrive one-way clutch assembly and center shaft as an assembly.



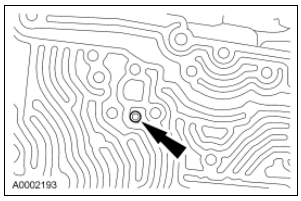
36. **NOTE:** Tag and identify the center shaft thrust bearing No. 3 for reassembly.

    Remove the No. 3 center shaft thrust bearing.

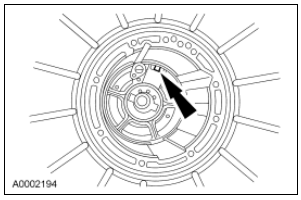


37. ⚠ **CAUTION: The center support locknut could fall into the remaining assembly if not removed.**

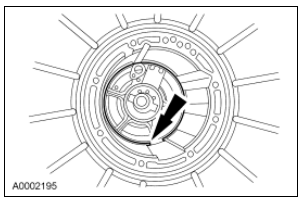
    Remove the bolt.



38. Remove the locknut and cage.



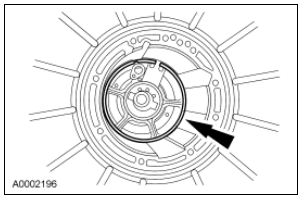
39. Remove the center support retaining ring.



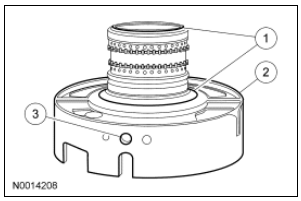
40. **NOTE:** The center support is repaired as an assembly. Any damage requires installing a new component.

    NOTE: When removing the center support, pull evenly around the center support web.

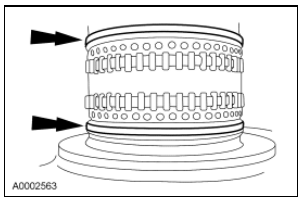
    Remove the center support.



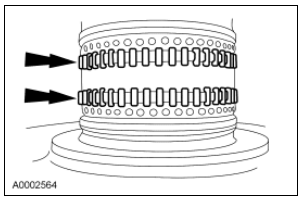
41. Inspect the center support assembly for wear or damage.
    1. Inspect the thrust surfaces for wear or damage.
    2. Inspect the center support sealing surface.
    3. Inspect the fluid passage for blockage or damage.



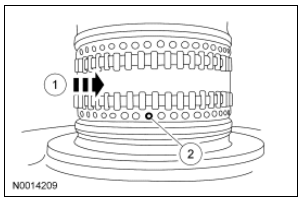
42. Inspect the seal rings for damage.



43. Inspect the bearing for missing rollers or damage.

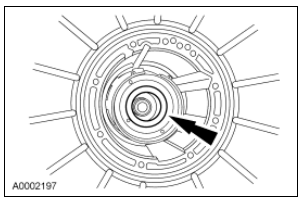


44. Inspect the direct clutch feed hole for blockage or damage.
    1. Rotate the center support bearing to locate the direct clutch feed hole.
    2. Inspect the direct clutch feed hole for blockage or damage.

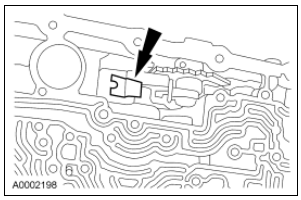


45. **NOTE:** Tag and identify the No. 4 intermediate clutch drum thrust bearing.

Remove the intermediate brake drum thrust bearing (No. 4).



46. Remove, tag and identify the band anchor strut for assembly.

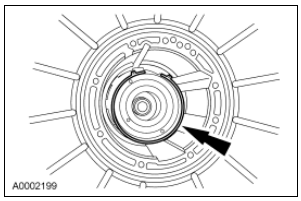


47. ⚠ **CAUTION: Identify the anchor and apply ends of the intermediate band.**

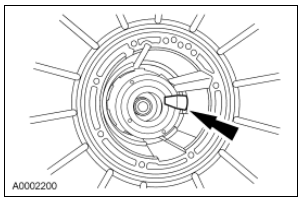
NOTE: The new intermediate band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

Remove and inspect the intermediate band. Check the following conditions when installing a new band:

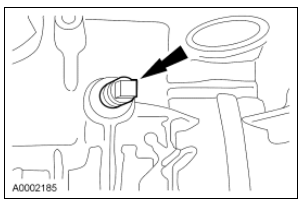
- Inspect for glazing.
- Inspect for missing friction material.
- Inspect for material flaking.
- Inspect for damage to the anchor pins.



48. Remove, tag and identify the band apply strut.



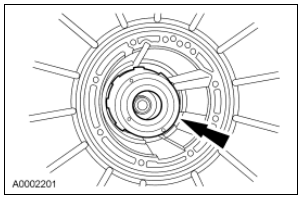
49. Remove the screw.



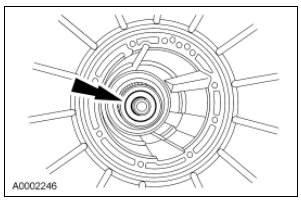
50. **NOTE:** The No. 5 forward clutch cylinder thrust bearing may come out with the intermediate brake

and direct clutch drum.

Remove the direct clutch drum.

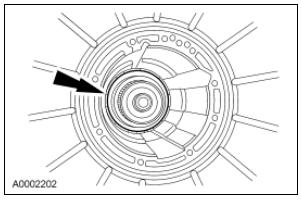


51. Remove the No. 5 forward clutch cylinder thrust bearing, tag and identify.



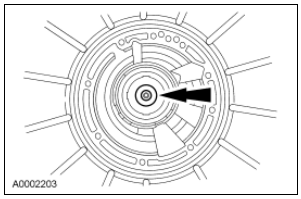
52. **NOTE:** The No. 6A thrust bearing may come out with the cylinder. Tag and identify for reassembly.

    Remove the forward clutch cylinder.



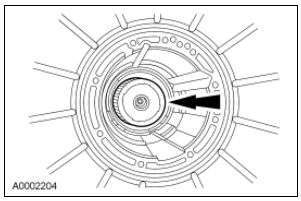
53. **NOTE:** The No. 6A forward ring gear hub thrust bearing may have come out with the forward clutch cylinder.

    Remove the No. 6A forward ring gear hub thrust bearing.

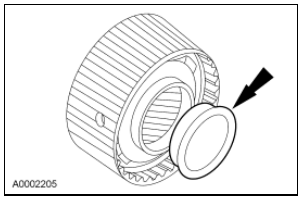


54. **NOTE:** The No. 7 forward planet thrust bearing may come out with the forward ring gear and hub assembly.

    Remove the forward ring gear and hub as an assembly.

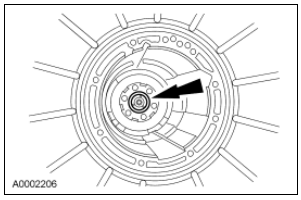


55. Remove the No. 6B forward clutch thrust washer from the forward ring gear hub.

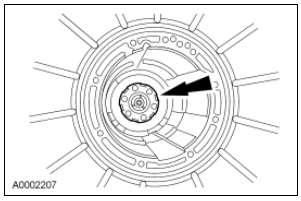


56. **NOTE:** The No. 7 forward planet thrust bearing may come out with the forward ring gear and hub assembly.

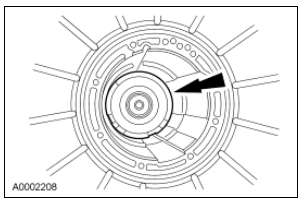
    Remove the No. 7 forward planet thrust bearing.



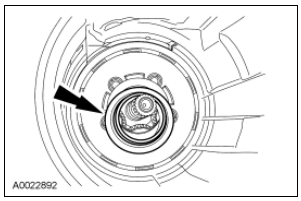
57. Remove the forward planetary assembly.



58. Remove the input shell and sun gear assembly.

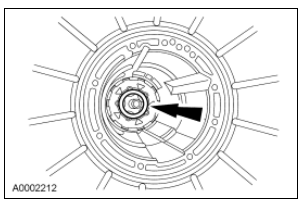


59. Remove the spacer.

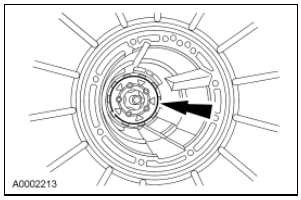


60. **NOTE:** Tag and identify the No. 8 low/reverse planetary carrier thrust bearing.

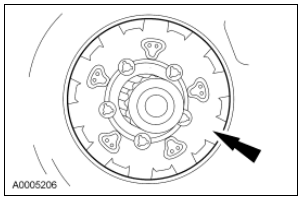
    Remove the thrust bearing.



61. Remove the retaining ring.

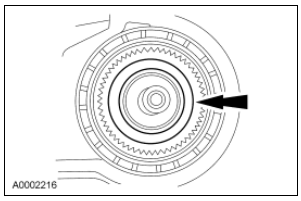


62. Remove the low/reverse planetary assembly.



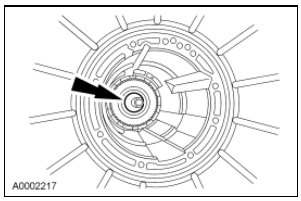
63. **NOTE:** Tag and identify the No. 9 low/reverse planetary carrier thrust bearing.

    Remove the thrust bearing.



64. **NOTE:** Use slots located around the outside of the sleeve.

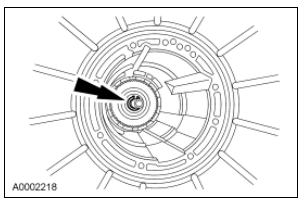
    Using a small pick, remove the output shaft sleeve.



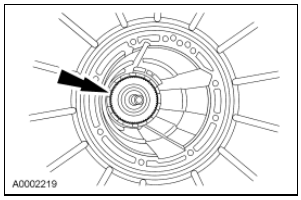
65. **⚠ WARNING: The output shaft may fall out after removing the snap ring. Failure to follow these instructions may result in personal injury.**

    ⚠ CAUTION: Discard the output shaft retaining ring. A new retaining ring must be used for assembly.

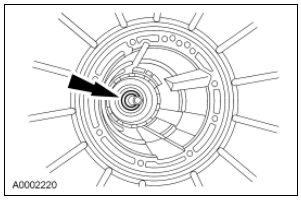
    While holding the output shaft, remove and discard the output shaft retaining ring.



66. Remove the output shaft ring gear and hub.



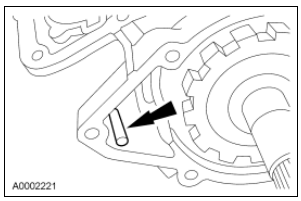
67. Remove the No. 10 low intermediate sun gear bearing.



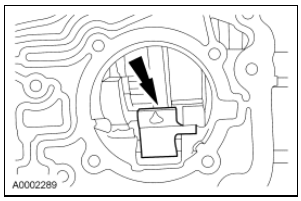
68. ⚠ **CAUTION: Do not pry on the outer edge of the case. Damage to the gasket sealing surface could occur.**

    NOTE: It may be necessary to grind flat spots on the edges of the reverse band actuating lever shaft in order to remove it.

    Using a pair of vice grips, hold the flat spots on the reverse band actuating lever shaft, wiggle it back and forth and remove the reverse band actuating lever shaft.

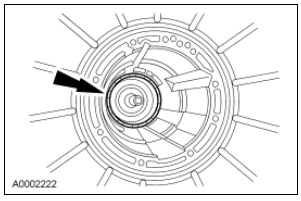


69. Remove the reverse band actuating lever assembly.



70. **NOTE:** The inner race of the rear one-way clutch is not removable. It is repaired in the case.

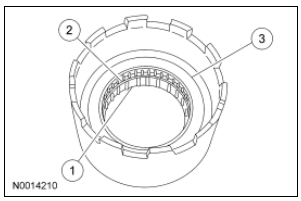
    Remove the low/reverse brake drum and one-way clutch assembly by rotating it clockwise.



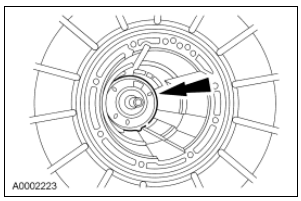
71. **NOTE:** The reverse one-way clutch is part of the reverse brake drum assembly. Install a new reverse brake drum as an assembly only.

    Inspect the reverse brake drum assembly and install a new reverse brake drum assembly if damaged.

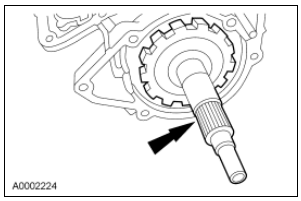
1. Inspect the reverse brake drum sprags.
2. Inspect the reverse brake drum rollers.
3. Inspect the reverse brake drum.



72. Remove the reverse band.

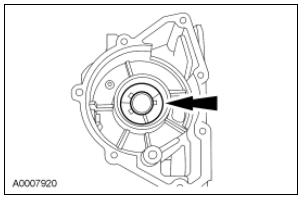


73. Remove the output shaft and park gear.



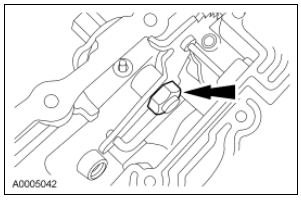
74. **NOTE:** Tag and identify the No. 11 output shaft thrust washer.

    Remove the output shaft thrust washer.

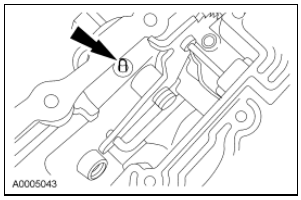


75. ⚠ **CAUTION: To avoid damage, make sure the wrench does not strike the manual valve inner lever pin.**

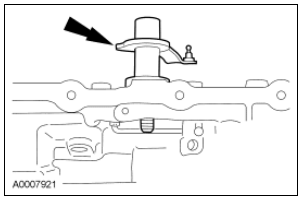
    Remove the nut.



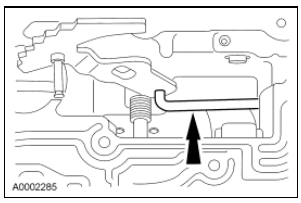
76. Remove the manual shaft retaining pin.



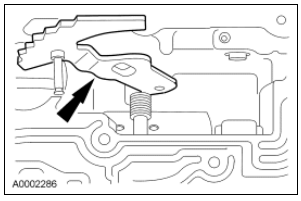
77. Remove the manual control lever shaft.



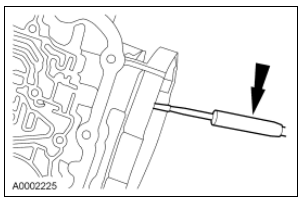
78. Disconnect the manual valve inner lever from the parking lever actuating rod.



79. Remove the manual valve inner lever.

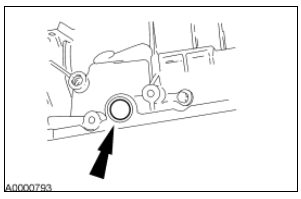


80. Remove the parking lever actuating rod.



81. ⚠ **CAUTION: Do not damage the bore.**

Remove the manual control lever seal.



Main Control Valve Body

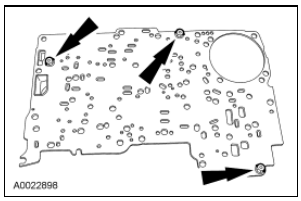
76	7Z490	Plate assembly main control valve body separator
77	7E195	Ball lubrication check
78	7E195	Ball shuttle valve
79	7A101	Body control valve lower
80	W701099-S430	Screw separator plate

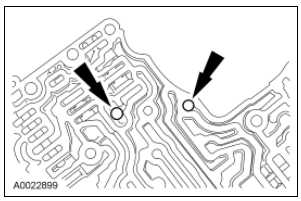
Disassembly

1. **NOTE:** The valve body separator plate has a bonded gasket. Do not reuse. Discard the plate.

   Remove and discard the valve body separator plate.



2. Remove the check balls.



3. **NOTE:** Refer to the disassembled view.

   Disassemble the main control valve body only if cleaning is required.

Assembly

1. ⚠ **CAUTION: Do not lose parts when cleaning or repairing.**

   Thoroughly clean all parts in solvent and blow dry with moisture-free compressed air.

2. ⚠ **CAUTION: Do not stone, file or sand the valves. This will remove the anodized finish and may result in further main control or transmission damage.**

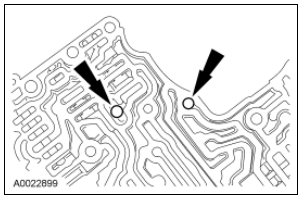
   After cleaning the main control valve body, carry out the following.

   - Inspect all valve and plug bores for scoring or burrs.

- Check all fluid passages for obstructions.
- Inspect all valves and plugs for burrs.
- Inspect all mating surfaces for burrs or distortion.
- Inspect all springs for distortion.
- Check all valves and plugs for free movement in their respective bores.
    - ♦ Valves and plugs, when dry, must fall from their own weight into their respective bores.
- Roll the manual valve on a flat surface to check for a bent condition.

3. Assemble the main control valve body.

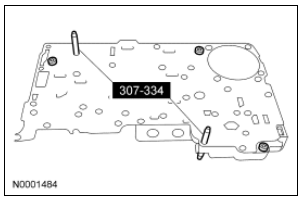
4. Install the main control valve body check balls.



5. **NOTE:** Use a new valve body separator plate for main control valve body installation.

   Using the special tools, install a new main control valve body separator plate.

   - Tighten to 7 Nm (62 lb-in).



Fluid Pump

Printable View (476 KB)

Special Tool(s)

 ST1833-A	Installer, Torque Converter Fluid Seal 307-349 (T97T-77000-A)
ST1817-A	Alignment Set, Fluid Pump 307-S039 (T74P-77103-X)
ST2532-A	Aligner, Fluid Pump Handle 307-431

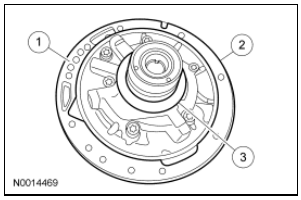
 ST2684-A	Transmission Fluid Pump Seal Aligner 307-451/1
 ST2685-A	Transmission Fluid Pump Seal Sizer 307-451/2
 ST2686-A	Transmission Fluid Pump Seal Installer 307-451/3

Material

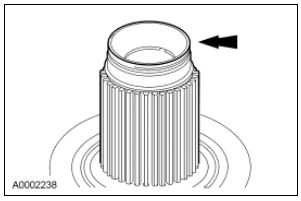
Item	Specification
Multi-Purpose Grease XG-4	ESR-M1C159-A

Disassembly

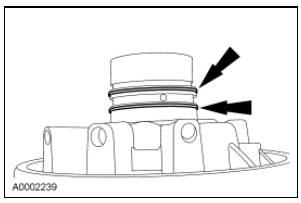
1. Remove the fluid pump gasket, fluid pump seal ring, and the No. 1 thrust washer.
    1. Remove and discard the fluid pump gasket.
    2. Remove and discard the fluid pump seal ring (square cut).
    3. Remove and tag the No. 1 thrust washer.



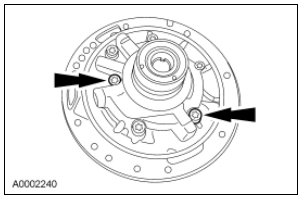
2. Remove the fluid pump support seal ring.



3. Remove the seal rings.



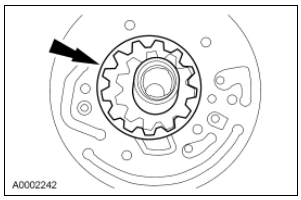
4. Remove the fluid pump housing.



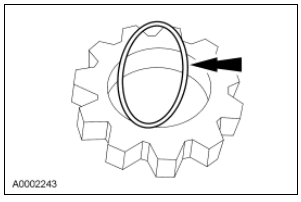
5. **NOTE:** A rough casting on the pump surface crescent is not a flaw.

   NOTE: The fluid pump gears are part of the pump assembly and are not repaired separately.

   Remove the fluid pump gears.

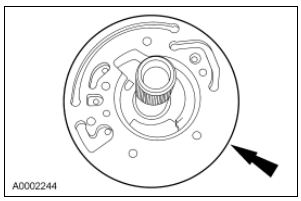


6. Remove the drive gear O-ring seal and discard. Inspect the fluid pump gears for cracks and scoring.

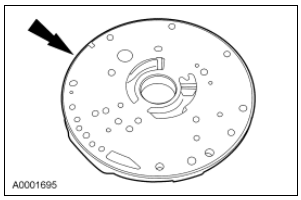


7. Inspect the overdrive pump.
   - Inspect the overdrive pump support gear pockets for scoring and wear.

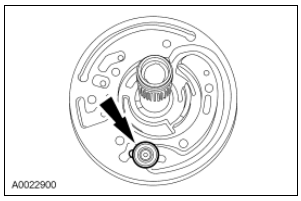
- Clean and inspect the overdrive and rear input shaft bushings.



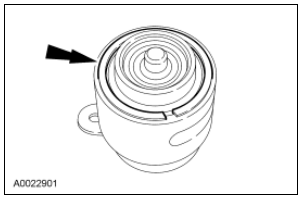
8. Inspect the fluid pump adapter plate for scoring and wear.



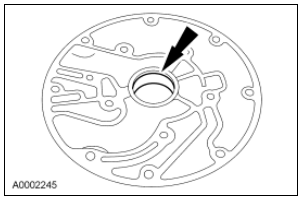
9. Remove the valve.



10. Remove and discard the seal.



11. Inspect the fluid pump to converter housing bushing.



Assembly

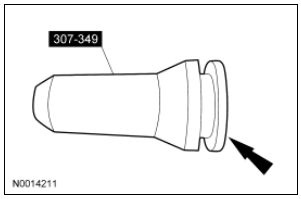
1. **NOTE:** Minor burrs and scoring may be removed with crocus cloth. If damage is found, install a new assembly.

   Inspect the fluid pump components for the following:

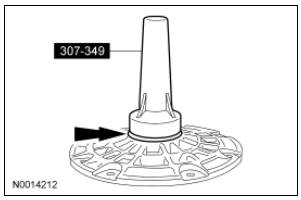
   - Pump body and case for burrs.
   - Fluid passages for obstructions.

2. **NOTE:** Check and make sure that the garter spring in the seal has not popped off of the converter hub seal.

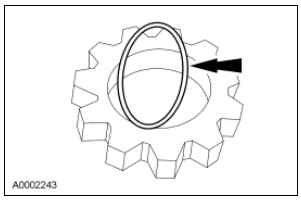
Install a new seal onto the special tool.



3. Using the special tool, install the converter hub seal.

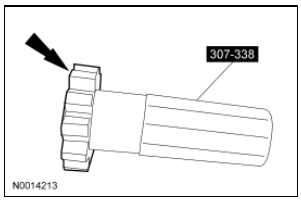


4. Install a new O-ring seal in fluid pump drive gear.



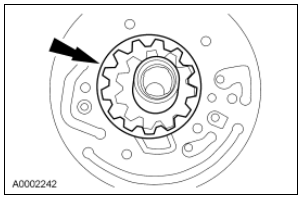
5. ⚠ **CAUTION: Lubricate the special tool with multi-purpose grease.**

   Using the special tool, seat the O-ring seal in the pump gear.

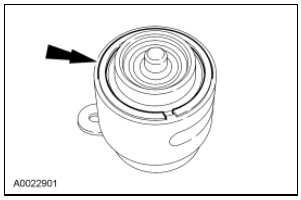


6. ⚠ **CAUTION: The chamber on the inside edge of the small gear must be up when in the pump housing gear pocket. The dimple on the larger gear must be down when in the pump housing gear pocket.**

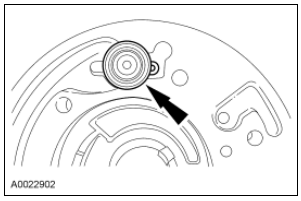
   Install the pump gears into the fluid pump housing. Apply multi-purpose grease to pump gear to prevent scoring at start up.



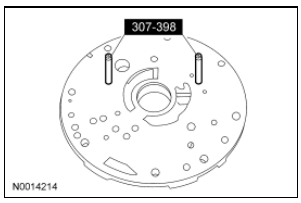
7. Install a new seal on the valve.



8. Install the valve with the tab facing down.

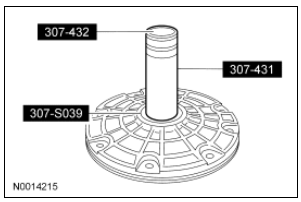


9. First install the fluid pump adapter plate and then the alignment pins in their correct location.

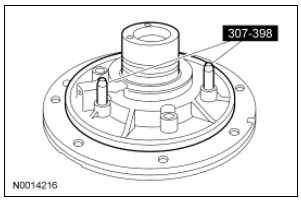


10. ⚠ **CAUTION: The special tools must be used to correctly align the pump with the adapter plate to reduce gear noise, bushing failure and leakage.**

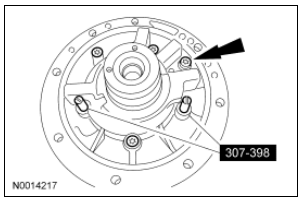
    Using the special tool, align the fluid pump to the adapter plate.



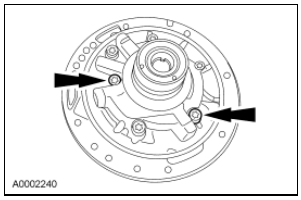
11. Using the special tools, assemble the pump.



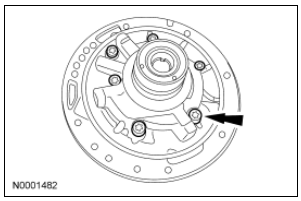
12. Loosely install the fluid pump housing screws in their correct location and remove the special tools.



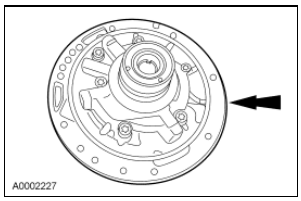
13. Install the 2 remaining screws.



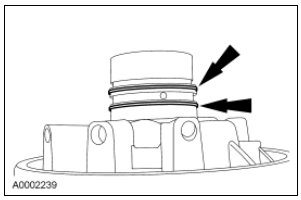
14. Tighten all of the fluid pump screws in a star pattern.
    - Tighten to 25 Nm (18 lb-ft).



15. Install a new fluid pump seal ring.

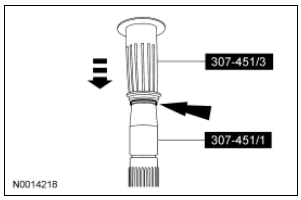


16. Install the 2 overdrive brake drum seals.



17. ⚠ **CAUTION: Be careful not to overstretch the seal ring past the seal ring groove. Damage to the seal will occur.**

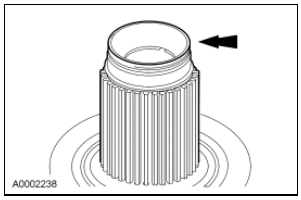
    Using the special tools, install the fluid pump seal ring.



18. ⚠ **CAUTION: Verify correct seal installation. Make sure seal grooves are clean and free of burrs.**

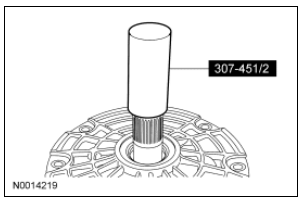
    NOTE: Make sure seal grooves are clean and free of burrs. Make sure that the seal is seated into the groove.

    Verify the seal is installed correctly.



19. ⚠ **CAUTION: Failure to correctly size the seal will cause damage to the seal when the torque converter is installed.**

    Using the special tool, size the seal to the correct size. Leave the special tool on the seal ring for 2 minutes to obtain the correct seal size.



Overdrive Brake and Coast Clutch Drum Assembly

Printable View (307 KB)

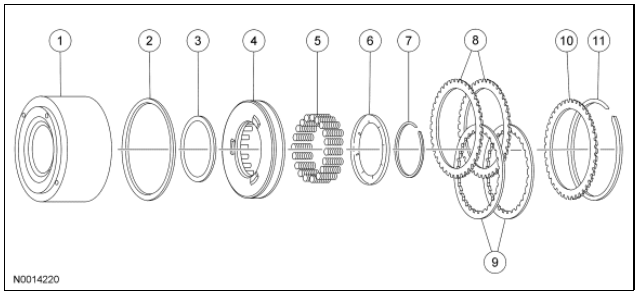
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
ST2431-A	Protector, Piston Seal 307-049 (T74P-77404-A)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Overdrive Brake and Coast Clutch Drum Assembly

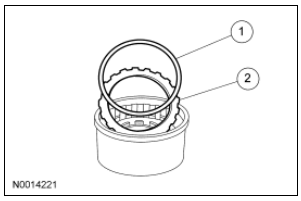


Item	Part Number	Description
1	7L669	Coast clutch drum
2	7A548	Overdrive piston outer seal ring
3	7D404	Overdrive piston inner seal ring
4	7A262	Overdrive clutch piston
5	7A480	Overdrive piston spring (20 required)
6	7A527	Coast clutch piston spring retainer
7	E860125-S	Retaining ring
8	7B442	Coast clutch external plate steel (2 required)
9	7B164	Coast clutch internal plate friction (2 required)
10	7B066	Coast clutch pressure plate
11	E860126S/129S	Retaining ring (select fit)

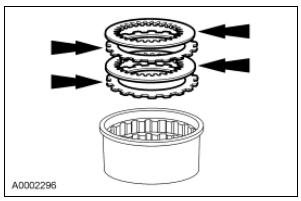
Disassembly

1. Remove the coast clutch pressure plate.

1. Remove the coast clutch retaining ring.
2. Remove the coast clutch pressure plate.



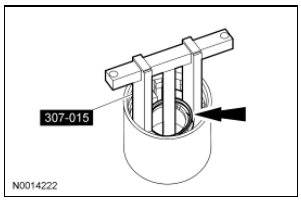
2. Remove the coast clutch disc pack.
   - Inspect for wear, install a new pack as necessary.



3. **⚠ WARNING: Use caution when releasing tool pressure on the rear clutch piston spring. Failure to follow these instructions may result in personal injury.**

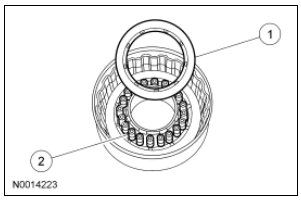
   ⚠ CAUTION: Do not fully compress the special tool or damage to the spring retainer may occur.

   Using the special tool, remove the coast clutch piston retaining ring.



4. Relieve the coast clutch spring tension and remove the special tool.

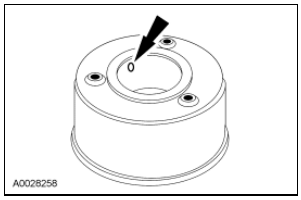
5. Remove the coast clutch piston springs.
   1. Remove the coast clutch piston retainer.
   2. Remove the clutch piston springs.



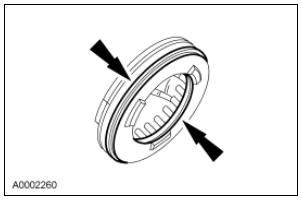
6. **⚠ WARNING: Air pressure must not exceed 138 kPa (20 psi). Wear safety glasses when using compressed air, and make sure the drum is facing down as shown. Failure to follow these instructions may result in personal injury.**

   Remove the coast clutch piston.

   - Apply air pressure to the hole in the drum to remove the coast clutch piston while blocking the other hole with a finger.



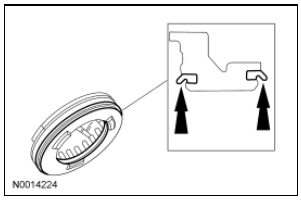
7. Remove and discard the coast clutch piston inner seal and the coast clutch piston outer seal.



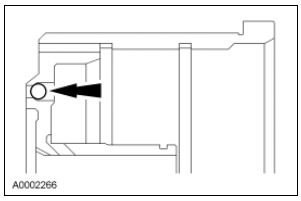
Assembly

1. ⚠ **CAUTION: The lip seals must be positioned as shown. Care must be taken to prevent rollover of the lip seal.**

   Install the new coast clutch piston inner and outer seal.



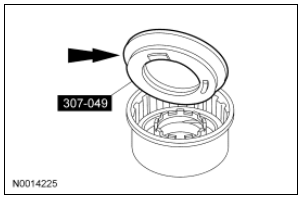
2. Verify the check ball is free to move.



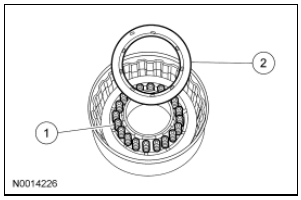
3. ⚠ **CAUTION: Care must be taken to prevent damage to the seals during installation.**

   Using the special tool, install the coast clutch piston.

   - Lubricate the seals with transmission fluid.

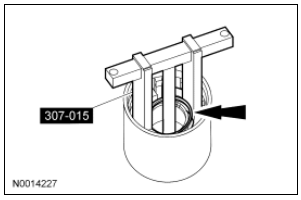


4. Install the coast clutch piston springs.
   1. Install the coast clutch piston springs.
   2. Install the coast clutch spring retainer.



5. **⚠ CAUTION: Do not fully compress the special tool or damage to the coast clutch piston spring retainer may occur.**

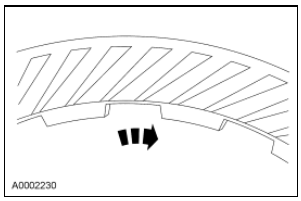
   Using the special tool, install the coast clutch piston spring retainer ring.



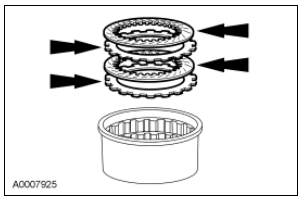
6. **⚠ CAUTION: Coast clutch friction plates are directional and must be installed with grooves clockwise (I.D. to O.D.). The word "TOP" should face up.**

   ⚠ CAUTION: If new clutch plates are being used, they should be soaked in clean automatic transmission fluid before assembly.

   When installing friction plates, the word "TOP" should face up. If reusing plates, grooves must be installed clockwise. Install the coast clutch disc pack.



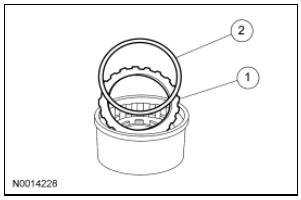
7. Install the 2 steel clutch plates and 2 friction clutch plates in alternating order starting with a steel clutch plate.



8. **⚠ CAUTION: The retaining ring is select fit.**

   Install the coast clutch pressure plate.

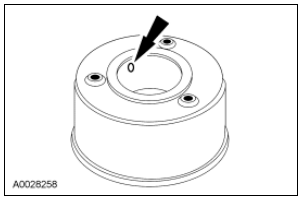
   1. Install the coast clutch pressure plate.
   2. Install the original coast clutch retaining ring.



9. ⚠ **WARNING: Air pressure must not exceed 138 kPa (20 psi). Wear safety glasses when using compressed air, and make sure drum is facing down as shown. Failure to follow these instructions may result in personal injury.**

   Air check the assembly.

   - Apply air pressure to the hole in the drum while blocking the other hole with a finger.



10. Check the coast clutch disc pack free play.
    1. Push down on the coast pressure plate.
    2. Check clearance between the coast clutch retaining ring and coast pressure plate. Clearance should be 1.3-2.0 mm (0.051-0.079 in). If clearance is not within the specification, install a correct coast clutch retaining ring that will provide the correct free play adjustment.

Direct Clutch Drum Assembly

Printable View (316 KB)

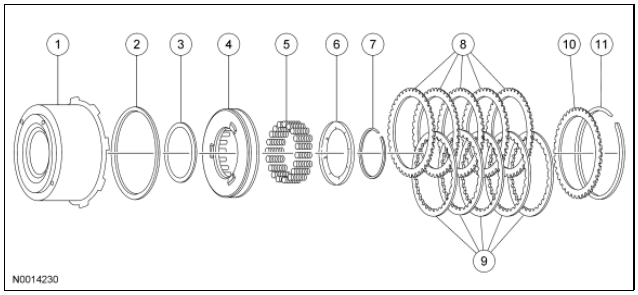
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
ST2431-A	Protector, Piston Seal 307-049 (T74P-77404-A)

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Direct Clutch Drum Assembly

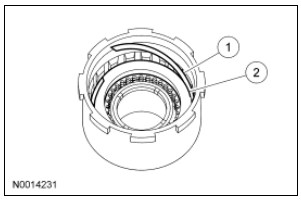


Item	Part Number	Description
1	7D044	Intermediate brake drum assembly
2	7A548	Direct piston outer seal ring
3	7D404	Direct piston inner seal ring
4	7A262	Direct clutch piston
5	7A480	Direct piston spring (20 required)
6	7A527	Direct clutch piston spring retainer
7	E860125-S	Retaining ring
8	7B442	Direct clutch external spline plates
9	7B164	Direct clutch internal spline plates
10	7B066	Direct clutch pressure plate
11	E860126S/129S	Retaining ring (select fit)

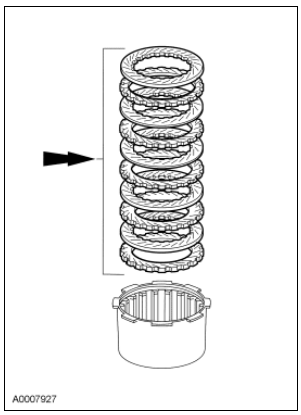
Disassembly

1. Remove the direct clutch retaining ring and the direct clutch pressure plate.

1. Remove the direct clutch retaining ring.
2. Remove the direct clutch pressure plate.



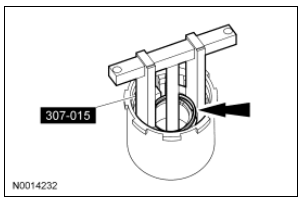
2. Remove the direct clutch disc pack.
   - Inspect and install new friction plates if worn, damaged or overheated.



3. **⚠ WARNING: After removing the retaining ring, use care when releasing the pressure on the springs. Failure to follow these instructions may result in personal injury.**

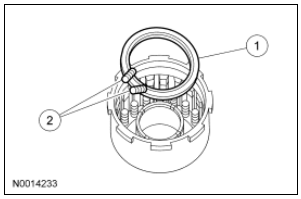
   ⚠ CAUTION: Do not fully compress the special tool or damage to the spring retainer may occur.

   Using the special tool, remove the direct clutch piston retaining ring.



4. Relieve the direct clutch spring tension and remove the special tool.

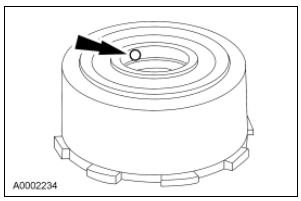
5. Remove the direct clutch piston spring retainer and the direct clutch piston springs.
   1. Remove the direct clutch piston spring retainer.
   2. Remove the direct clutch piston springs.



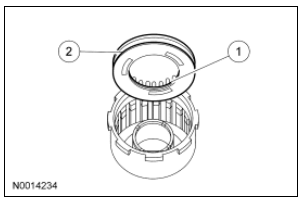
6. **⚠ WARNING: Air pressure must not exceed 138 kPa (20 psi). Wear safety glasses when using compressed air, and make sure the drum is facing down as shown. Failure to follow these instructions may result in personal injury.**

Using compressed air, remove the direct clutch piston from the direct clutch drum.

- Apply air pressure to the hole in the drum while blocking the other hole with a finger.



7. Remove and discard the direct clutch piston inner and outer seal.
    1. Remove and discard the direct clutch piston inner seal.
    2. Remove and discard the direct clutch piston outer seal.
    - Clean the components as necessary.



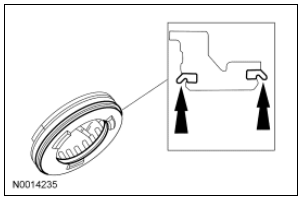
Assembly

1. Inspect the clutch components for damage or wear. Install new components as necessary.
    - Inspect the drum surface for damage.
    - Inspect the clutch piston bore, and piston.
    - Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.
    - Inspect the clutch plates for damage.
    - Inspect the clutch springs.

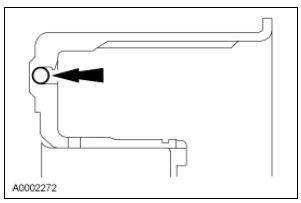
2. ⚠ **CAUTION: The lip seals must be positioned as shown. Care must be taken to prevent rollover of the lip seal.**

    NOTE: Use new seals to help prevent seal failures.

    Install the new direct clutch piston inner seal and the direct clutch piston outer seal.



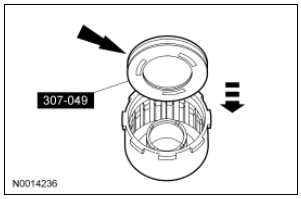
3. Verify the check ball is free to move.



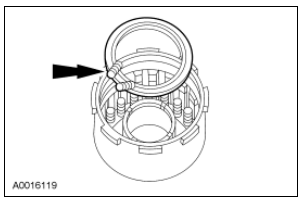
4. ⚠ **CAUTION: Care must be taken to prevent damage to the seals during installation.**

Using the special tool, install the direct clutch piston.

- Lubricate the seals with transmission fluid before installing.



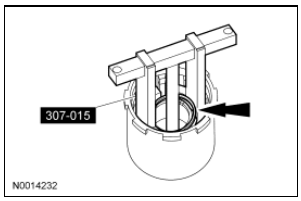
5. Install the direct clutch piston springs and the retainer.



6. **⚠ WARNING: After removing the retaining ring, use care when releasing the pressure on the springs. Failure to follow these instructions may result in personal injury.**

   ⚠ CAUTION: Do not fully compress the special tool or damage to the spring retainer may occur.

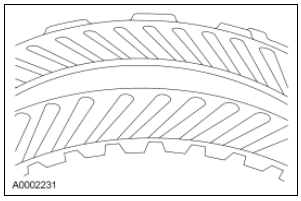
   Using the special tool, install the direct clutch piston retaining ring.



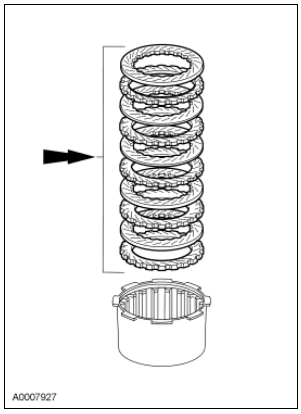
7. **⚠ CAUTION: The direct clutch friction plates are directional and must be installed correctly. Alternate the internally splined (clockwise) and the externally splined (counterclockwise) clutch plates.**

   ⚠ CAUTION: If new plates are used, they should be soaked in clean automatic transmission fluid before assembly.

   When installing friction plates, alternate the internally splined (clockwise) and the externally splined (counterclockwise) clutch plates. Install the direct clutch disc pack.

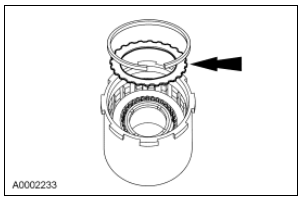


8. Install the friction plates alternating the internally splined (clockwise) and the externally splined (counterclockwise) clutch plates starting with an externally splined (counterclockwise) clutch plate.



9. ⚠ **CAUTION: The retaining ring is a select fit.**

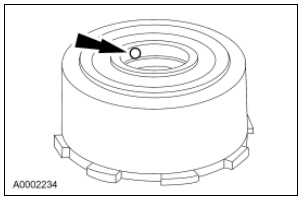
   Install the direct clutch pressure plate using the original direct clutch retaining ring.



10. ⚠ **WARNING: Air pressure must not exceed 138 kPa (20 psi). Wear safety glasses when using compressed air, and make sure drum is facing down as shown. Failure to follow these instructions may result in personal injury.**

    Air check the assembly.

    - Apply air pressure to the hole in the drum while blocking the other hole with a finger.



11. Push down on direct clutch disc pack and check gap between the direct clutch retaining ring and the direct clutch pressure plate with a feeler gauge.
    - If specifications do not match, use a select fit direct clutch retaining ring to match specifications and verify with a feeler gauge.

      Direct Clutch

Part Number	Thickness		Diameter	
	mm	In	mm	In

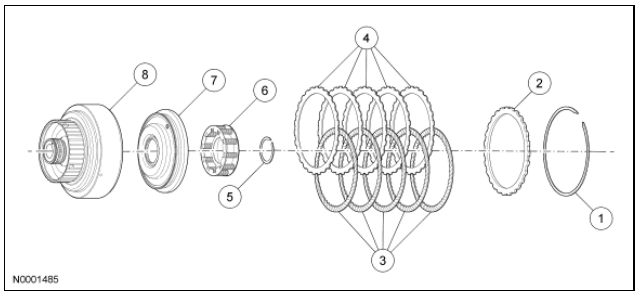
Special Tool(s)

 ST1190-A	Compressor, Clutch Spring 307-015 (T65L-77515-A)
ST1813-A	Protector, Piston Seal 307-051 (T74P-77548-A)
ST2534-A	Bonded Piston Seal Sizer 307-434

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V

Forward Clutch Assembly

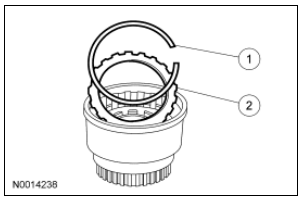


Item	Part Number	Description
1	7A360	Forward clutch cylinder assembly
2	7A262	Forward clutch piston
3	7G229	Forward clutch spring assembly
4	E860109-S	Forward clutch retaining ring
5	7B442	Forward clutch external plate-steel (vehicle-dependent)
6	7B164	Forward clutch internal plate- friction (vehicle-dependent)
7	7B066	Forward clutch pressure plate
8	7D483	Forward clutch retaining ring (select fit)

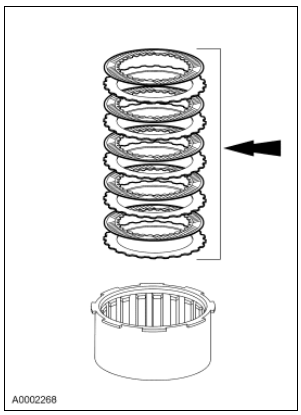
Disassembly

1. Remove the pressure plate.

1. Remove the forward clutch retaining ring.
2. Remove the pressure plate.



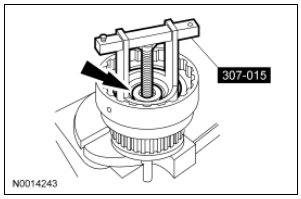
2. Remove the forward clutch disc pack.
   - Inspect the forward clutch plates for wear, damage or overheating.



3. **⚠ WARNING: Use caution when releasing tool pressure on the clutch piston springs. Failure to follow these instructions may result in personal injury.**

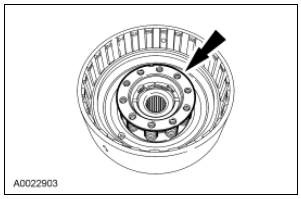
   ⚠ CAUTION: Do not fully depress the special tool or damage to the spring retainer may occur.

   Using the special tool, remove the forward clutch piston retaining ring.



4. Relieve the forward clutch spring tension and remove the tool.

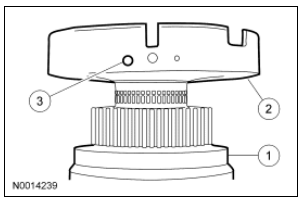
5. Remove the forward clutch piston spring assembly.



6. **⚠ WARNING: Air pressure must not exceed 138 kPa (20 psi). Wear safety glasses when using compressed air. Make sure the cylinder is facing down as shown. Failure to follow these instructions may result in personal injury.**

   Remove the forward clutch piston.

1. Place the forward clutch cylinder with forward clutch piston facing down.
2. Install the center support on the forward clutch cylinder.
3. Apply air pressure to the left port of the center support.

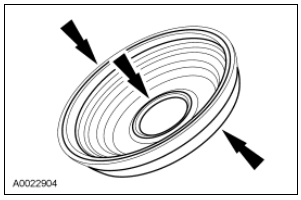


Assembly

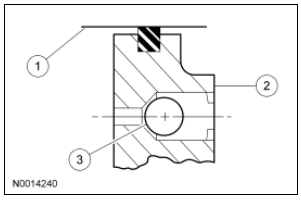
1. Inspect the clutch components for damage or wear. Install new components as necessary.
   - Check the fluid passages for obstructions. All fluid passages must be clean and free of obstructions.
   - Inspect the clutch plates for damage.
   - Inspect the clutch springs.
   - Inspect the needle bearing and seal rings for damage.
   - Check clutch hub thrust surfaces for damage.
   - Check clutch plates for flatness and fit on the clutch hub serrations.

2. **NOTE:** If the seals on the forward clutch piston show any signs of damage, the forward clutch piston will need to be replaced.

   Inspect the forward clutch piston and seals.

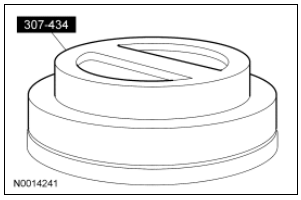


3. Inspect the forward clutch drum assembly.
   1. Inspect the forward clutch cylinder surfaces for scores or burrs.
   2. Inspect forward clutch piston for scores or burrs.
   3. Verify the check ball is free to move in the piston.



4. **NOTE:** The special tool must be installed on the forward clutch piston for a couple of minutes prior to installing it into the forward clutch cylinder.

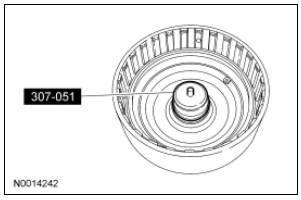
   Install the special tool on the forward clutch piston.



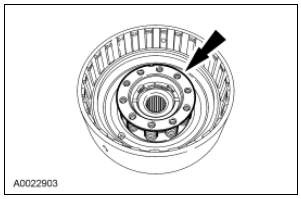
5. ⚠ **CAUTION: Care must be taken to prevent damage to the seals.**

   NOTE: Lubricate the forward clutch piston inner and outer seal with clean automatic transmission fluid.

   Using the special tool, install the forward clutch piston assembly into the forward clutch cylinder.

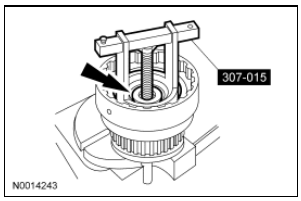


6. Install the forward clutch piston spring assembly.



7. ⚠ **CAUTION: Do not fully depress the clutch spring compressor or damage to the spring retainer may occur.**

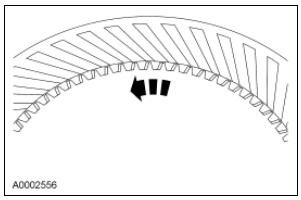
   Using the special tool, install the forward clutch piston spring retaining ring.



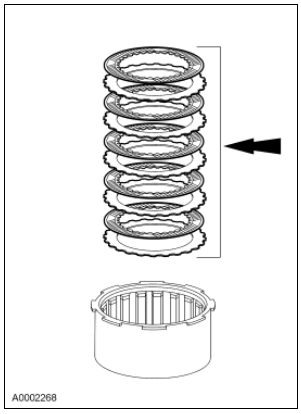
8. ⚠ **CAUTION: The forward clutch friction plates are directional and must be installed with grooves pointing counterclockwise.**

   ⚠ **CAUTION: If new plates are used, they should be soaked in clean automatic transmission fluid before assembly.**

   If reusing plates, grooves must be installed counterclockwise. Install the direct clutch disc pack.



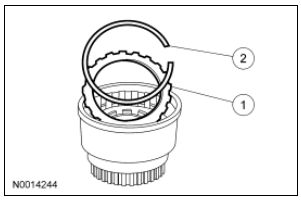
9. Install the steel clutch plates and friction clutch plates in alternating order starting with a steel clutch plate.



10. ⚠ **CAUTION: The retaining ring is a select fit.**

    Install the original selective retaining ring.

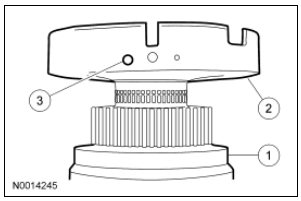
    1. Install the forward clutch pressure plate.
    2. Install the original selective retaining ring.



11. ⚠ **WARNING: Air pressure must not exceed 138 kPa (20 psi). Wear safety glasses when using compressed air. Make sure the cylinder is facing down as shown. Failure to follow these instructions may result in personal injury.**

    Air check the forward clutch piston.

    1. Place the forward clutch cylinder with forward clutch piston facing down.
    2. Install the transmission center support on the forward clutch cylinder.
    3. Apply air pressure to the left port of the center support.



12. Check forward clutch disc pack free play.
    1. Press down on forward clutch disc pack.
    2. Using a feeler gauge, check the gap between the forward clutch retaining ring and the forward clutch pressure plate.

    • If the clearance is not within specifications, install the correct size retaining ring.

Part Number	Thickness		Diameter

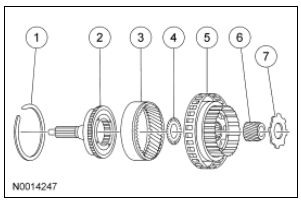
Overdrive Planetary and One-Way Clutch Assembly

Printable View (98 KB)



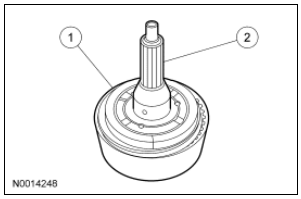
Item	Part Number	Description
1	W702037-S300	Retaining ring
2	7A658	Center shaft
3	7653	Overdrive ring gear
4	7L495	No. 2 overdrive planetary thrust bearing
5	7B446	Overdrive planetary gear carrier assembly
6	7D063	Overdrive sun gear
7	7660	Coast clutch adapter

Disassembly

1. **NOTE:** The overdrive one-way clutch is serviced with the center shaft assembly.

   Remove the center shaft from the overdrive ring gear.

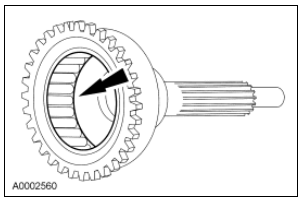
   1. Remove the overdrive center shaft retaining ring.
   2. While rotating counterclockwise remove the center shaft from the ring gear.



2. ⚠ **CAUTION: Do not remove the overdrive one-way clutch. Damage to the clutch may occur if it is removed.**

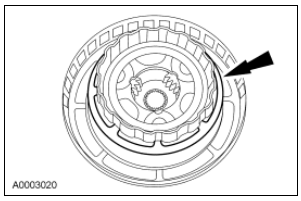
   Clean and inspect the overdrive one-way clutch and center shaft.

   - Inspect for cracks in the roller cage and wear on the roller clutch, and the press fit of the one-way clutch to the center shaft.



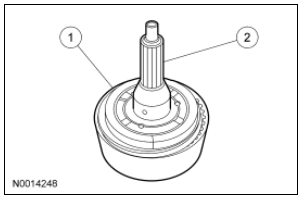
3. Inspect the one-way clutch.
   - Temporarily insert the overdrive planetary gear carrier assembly into the one-way clutch rollers for verification of the one-way clutch.

- The planetary gear must rotate counterclockwise and hold when rotated clockwise.
- Remove the planetary gear carrier assembly.



Assembly

1. Install the center shaft and one-way clutch.
    1. Install the center shaft and one-way clutch.
    2. Install the center shaft retaining ring.



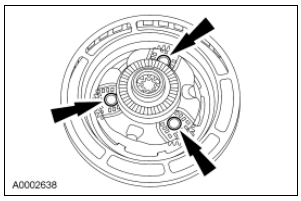
Overdrive Planetary Gears

Printable View (240 KB)

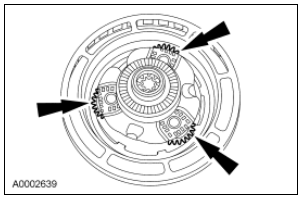
Disassembly

1. **NOTE:** Individual parts of the planetary carriers are not serviceable.

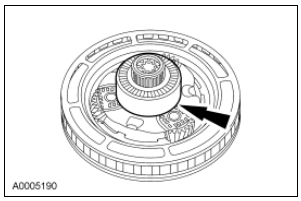
   Before installing a planetary assembly, the shaft retaining pins should be checked for adequate staking. Check the pins and shafts in the planetary assemblies for loose fit and/or complete disengagement. Install a new planetary assembly if necessary.



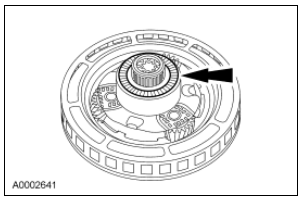
2. Inspect the pinion gears for damaged or excessively worn teeth and for free rotation.



3. Inspect the overdrive one-way clutch inner race and the inner and outer races for scored or damaged surface areas where the rollers contact the races.

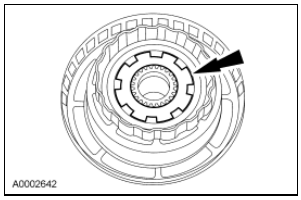


4. Remove and inspect the No. 2 overdrive planetary thrust bearing on the nose of the overdrive planetary gear carrier assembly.

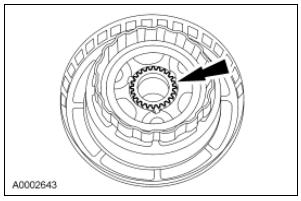


5. **NOTE:** Inspect the sun gear for damaged or worn teeth.

   Remove the coast clutch-to-overdrive carrier adapter.

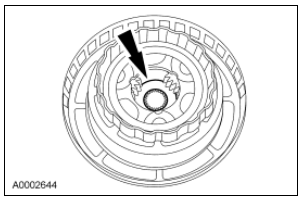


6. Remove and inspect the overdrive sun gear.



7. ⚠ **CAUTION: Do not attempt to remove the No. 12 bearing from behind the pinion gears.**

   Inspect the No. 12 bearing for damage.

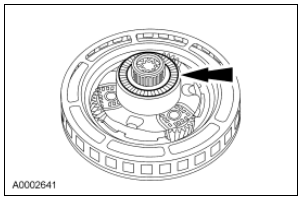


Assembly

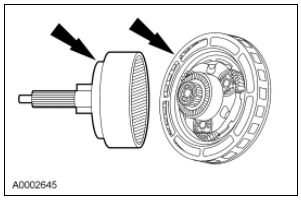
1. **NOTE:** Thoroughly clean all parts and blow dry with moisture-free compressed air.

   NOTE: Use petroleum jelly to hold the No. 2 overdrive planetary thrust bearing in place.

   Install the No. 2 overdrive planetary thrust bearing.

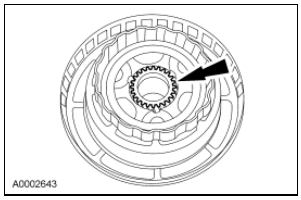


2. Install the overdrive planetary gear carrier into the center shaft and overdrive.



3. ⚠ **CAUTION: Make sure that the No. 12 bearing is in place in the overdrive planetary prior to installing the overdrive sun gear.**

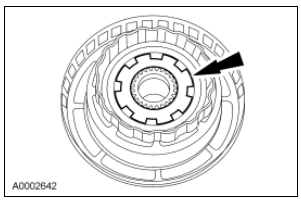
   Install the overdrive sun gear with the recessed gear teeth facing toward the adapter.



4. ⚠ **CAUTION: Adapter part number must not be visible after installation.**

   NOTE: Inspect the sun gear for damaged or worn teeth.

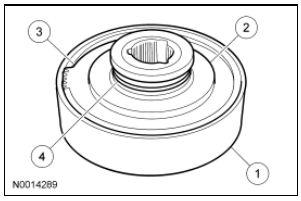
   Install the coast clutch-to-overdrive carrier adapter.



Output Shaft Ring Gear and Hub Shaft Assembly

Printable View (63 KB)

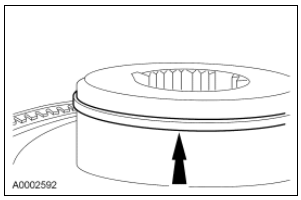
Disassembly



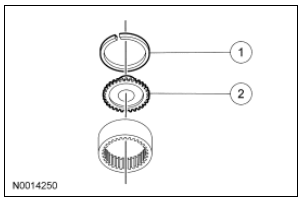
Item	Part Number	Description
1	7A153	Output shaft ring gear
2	7D164	Output shaft hub
3	7C122	Retaining ring
4	7D019	Output shaft hub seal

1. Inspect the output shaft ring gear and hub shaft assembly for damage. If repair is necessary, use the following procedure.

2. Remove the seal.

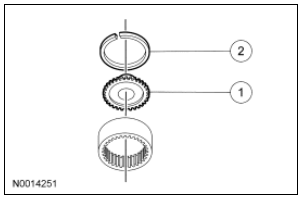


3. Remove the output shaft ring gear from the output shaft hub.
    1. Remove the retaining ring.
    2. Remove the output shaft ring gear.

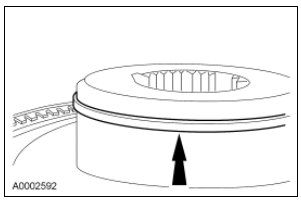


Assembly

1. Install the output shaft ring gear onto the output shaft hub.
    1. Install the output shaft ring gear.
    2. Install the retaining ring.



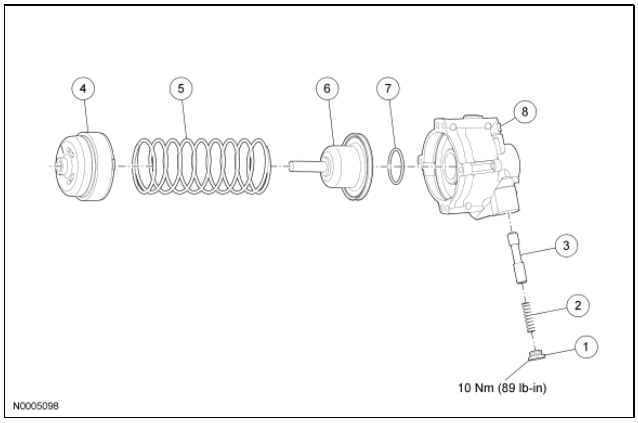
2. Install the seal.



Reverse Servo Assembly

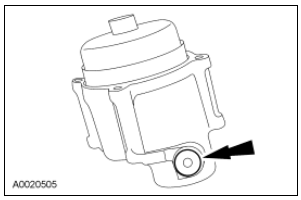
Printable View (153 KB)

Disassembly

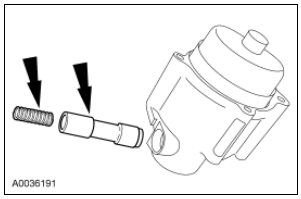


Item	Part Number	Description
1	7D321	Control valve spring retainer
2	7A270	Fluid pressure regulator valve spring
3	7D488	Reverse servo check valve
4	7D372	Reverse servo plate
5	7D466	Reverse servo accumulator spring
6	7D189	Reverse servo piston and seal
7	7423	Reverse servo piston O-ring
8	7D036	Reverse servo cover

1. Remove the control valve spring retainer.



2. Remove the reverse servo spring and check valve.

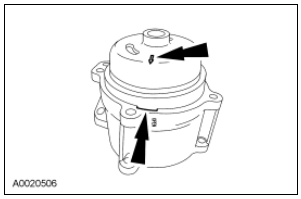


3. ⚠ **WARNING: The upper and lower servo covers are under spring tension. Use care when separating the two halves. Failure to follow these instructions can result in personal injury.**

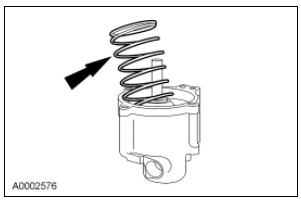
   NOTE: Tabs on servo plate mate with slots on cover every 120 degrees.

Remove the reverse servo plate by turning in either direction to release.

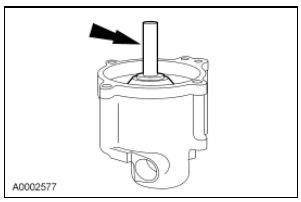
- Align the arrow on the servo plate with any slot on the cover.



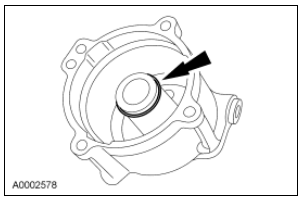
4. Remove the reverse servo spring.



5. Remove the reverse servo piston and seal assembly.
   - Inspect the seal for damage, install a new reverse servo piston if necessary.



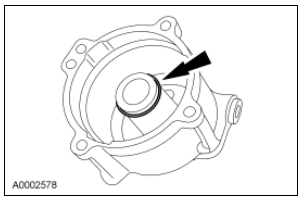
6. Remove and discard the reverse servo piston seal.



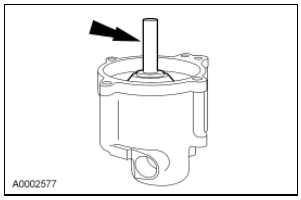
Assembly

1. **NOTE:** Try not to roll the seal onto the housing when installing the seal, or damage to the seal can occur.

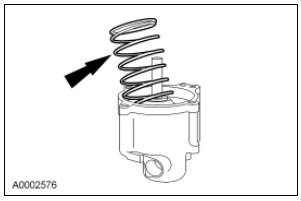
   Lubricate and install a new reverse servo piston seal.



2. Lubricate and install the reverse servo piston and seal assembly.



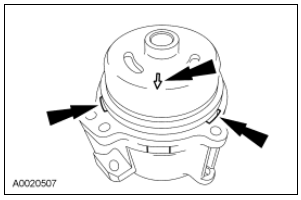
3. Install the reverse servo spring.



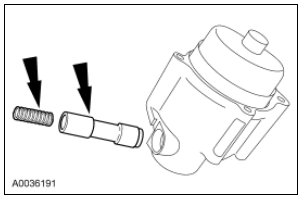
4. ⚠ **WARNING: The upper and lower servo covers are under spring tension. Use care when assembling the 2 halves. Failure to follow these instructions can result in personal injury.**

   ⚠ **CAUTION: The arrow on the servo plate must be aligned evenly between any 2 slots on the cover.**

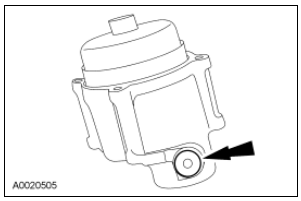
   Install the reverse servo plate.



5. Install the reverse servo spring and check valve.



6. Install the control valve spring retainer.
   - Tighten to 10 Nm (89 lb-in).



Transmission

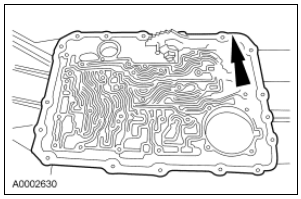
ST2440-A	Installer, Drive Pinion flange 205-479
ST2416-A	Installer, Output Shaft Flange 307-404

Material

Item	Specification
MERCON® V Automatic Transmission Fluid XT-5-QM	MERCON® V
Multi-Purpose Grease XG-4	ESR-M1C159-A

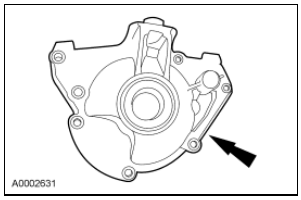
1. Thoroughly clean the transmission case and extension housing in solvent and blow dry with compressed air.

2. Inspect the transmission case for the following:
   - Stripped bolt hole threads
   - Gasket and mating surfaces for burrs or nicks
   - Obstructions to vent and fluid passages
   - Cracks or warpage

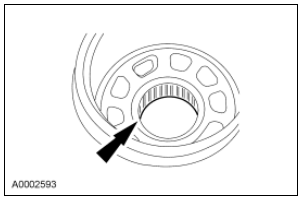


A0002630

3. Inspect the extension housing for cracks, burrs or warpage.

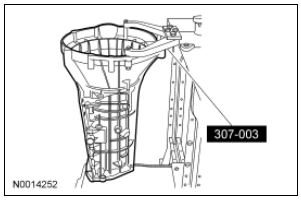


4. Inspect the case bearing for damage. If damage to the case bearing is indicated, install a new case.

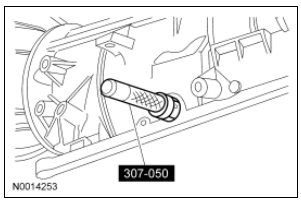


5. ⚠ **WARNING: Make sure the lock pin on bench-mounted holding fixture is secure. Failure to follow these instructions may result in personal injury.**

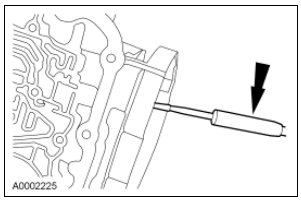
   Using the special tool, install the transmission into the bench with the converter housing facing up.



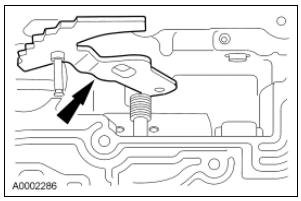
6. Using the special tool, install the manual control lever shaft seal and lubricate it with petroleum jelly.



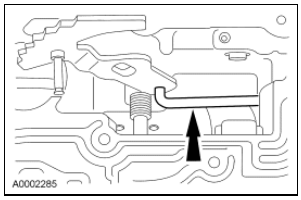
7. Install the parking lever rod.



8. Install the manual control lever.

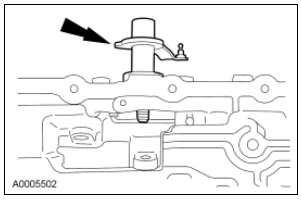


9. Assemble the manual valve inner lever and parking lever actuating rod as shown.

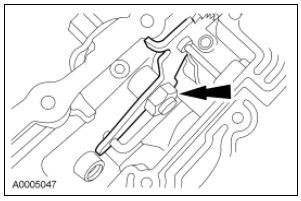


10. ⚠ **CAUTION: Align the flats on the manual valve inner lever with the flats on the manual control lever shaft.**

    Install the manual control lever shaft.



11. Install the manual valve inner lever onto the manual shaft and loosely install the nut.

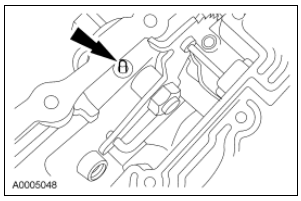


12. ⚠ **CAUTION: Use care not to damage the fluid pan rail surface when installing the retaining pin.**

    NOTE: Align the manual control lever shaft alignment groove with the manual control lever shaft spring pin bore in the transmission case.

    Install the manual control lever shaft spring pin.

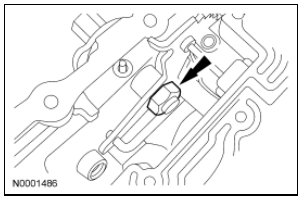
    - Tap the manual control lever shaft spring pin into the transmission case.



13. ⚠ **CAUTION: To avoid damage, do not allow the wrench to strike the manual valve inner lever pin.**

    Tighten the nut.

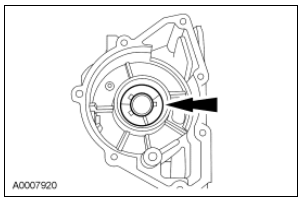
    - Tighten to 48 Nm (35 lb-ft).



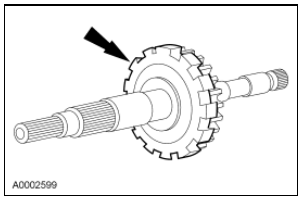
14. ⚠ **CAUTION: The tabs on the output shaft thrust washer (No. 11) point into the case. Make sure the thrust washer is correctly seated.**

    Install the output shaft thrust washer (No. 11).

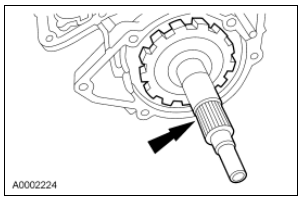
    - Coat the output shaft thrust washer with petroleum jelly.



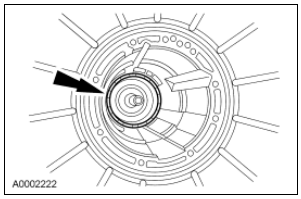
15. Install the park gear on the output shaft.



16. Install the output shaft and park gear.

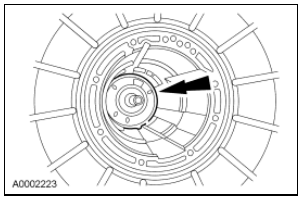


17. Install the low/reverse brake drum.
    - Rotate the low/reverse brake drum clockwise to install.



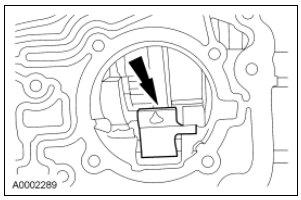
18. ⚠ **CAUTION: Make sure band is resting on the 2 anchor pins in the case.**

    Install the low/reverse band over the reverse drum.

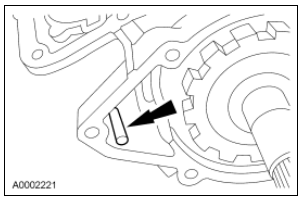


19. **NOTE:** The reverse band actuating lever must fit into the notches in the band.

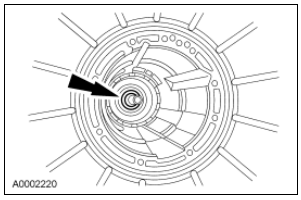
    Install the reverse band actuating lever into the reverse band.



20. Install the reverse band actuating lever shaft into the case and into the reverse band actuating lever.

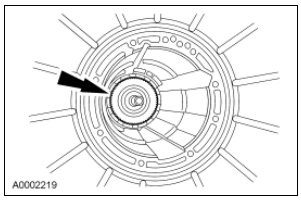


21. Install the No. 10 needle bearing into the case.



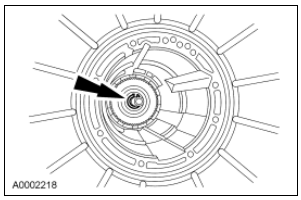
22. ⚠ **CAUTION: Do not damage the seal against the case during assembly.**

    Install the output shaft ring gear, hub and seal.



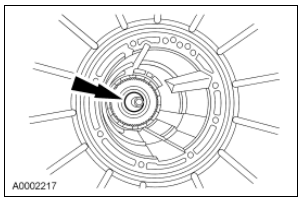
23. ⚠ **CAUTION: Always install a new output shaft retaining ring.**

    Install a new output shaft retaining ring.

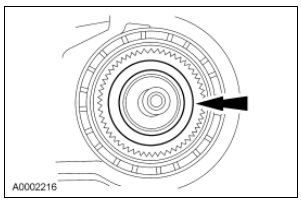


24. **NOTE:** Install the output shaft sleeve with the cone facing up. This sleeve will snap into place when correctly installed.

    Install the output shaft sleeve.

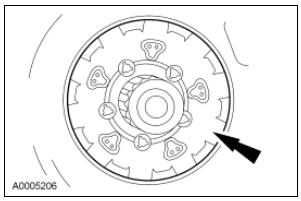


25. Install low/reverse planetary carrier needle bearing (No. 9) onto the output shaft ring gear and hub assembly.



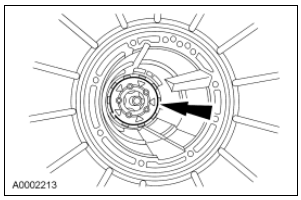
26. ⚠ **CAUTION: Make sure the needle bearings stay in place.**

    Install the low/reverse planetary assembly.

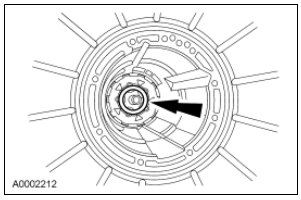


27. ⚠ **CAUTION: The low/reverse brake drum must be pulled forward to install the low/reverse planet retaining ring.**

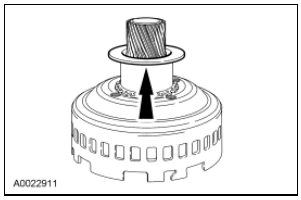
    Install the retaining ring.



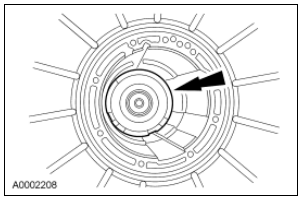
28. Install the No. 8 thrust bearing.



29. Install the spacer on the input shell, using petroleum jelly to hold it in place.

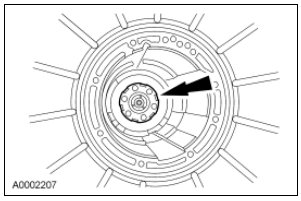


30. Install the input shell and sun gear assembly.

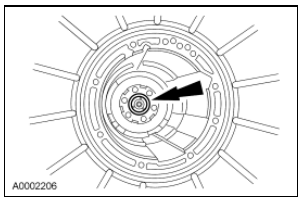


31. **NOTE:** The No. 13 bearing must be properly seated in the forward planet assembly so the sun gear can be installed correctly.

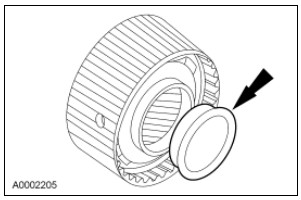
    Install the forward planetary assembly.



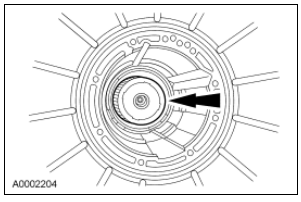
32. Install the No. 7 forward planet thrust bearing into the forward ring gear and hub assembly. Use petroleum jelly to hold the bearing in place.



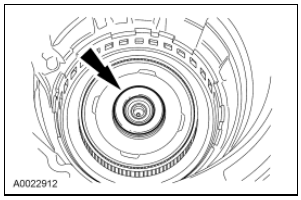
33. Install the No. 6B forward clutch thrust washer onto the forward ring gear hub.



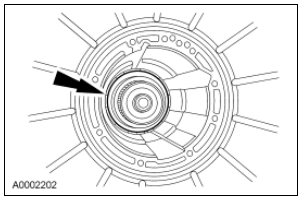
34. Install the forward ring gear and hub as an assembly.



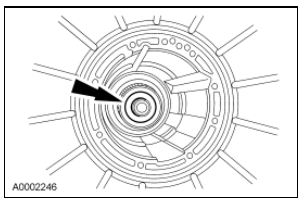
35. Install the No. 6A forward ring gear hub thrust bearing into the forward ring gear and hub.



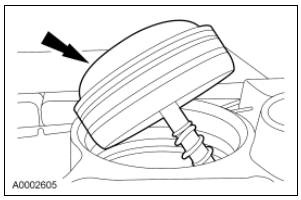
36. Install the forward clutch cylinder.



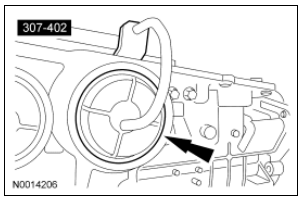
37. Install the No. 5 thrust bearing.



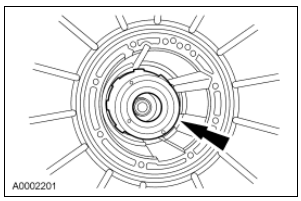
38. Install the intermediate servo piston and spring.
    - Lubricate the servo bore with clean automatic transmission fluid.



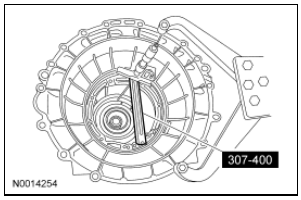
39. Using the special tool, install the retaining ring.



40. Install the direct clutch drum.



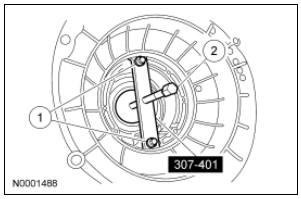
41. Using a depth micrometer with an 8-inch extension, measure from the top of the gauge bar to center support ledge in case at 4 places 90 degrees apart.
    - Add the 4 measurements, divide by 4, and record as dimension A.



42. ⚠ **CAUTION: The torque specifications are critical for this procedure. Failure to use the correct torque specifications may cause transmission damage.**

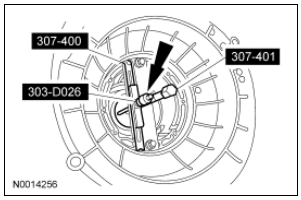
    Install the special tool.

    1. Install the special tool and the bolts using the 2 pump screw locations at approximately 6 and 12 o'clock positions.
        - ♦ Tighten to 15 Nm (11 lb-ft).
    2. Tighten the center screw.
        - ♦ Tighten to 1 Nm (10 lb-in).



43. **NOTE:** Align the disc holes on special tool with the slot in gauge bar for correct measurement.

    Measure the distance from the top of the gauge bar to the drum bearing surface through the hole in the disc and record as dimension B. Repeat measurement 180 degrees opposite side of the special tool and record as dimension C.



44. Add dimension B to C, divide by 2 and record as dimension D.

45. Subtract A from D, and record as dimension E.

46. Select bearing from the following chart, using dimension E.

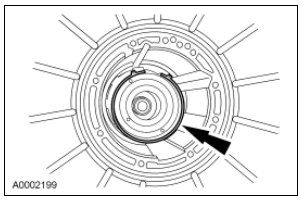
Dimension E	Service Part Number (7D014)	Bearing Thickness	Identification (Notches)
1.69-1.87 mm (0.066-0.074 in)	XW4Z-CA	2.65-2.80 mm (0.104-0.110 in)	None
1.88-2.04 mm (0.073-0.080 in)	XW4X-DA	2.83-2.98 mm (0.111-0.116 in)	One
2.05-2.22 mm (0.081- 0.088 in)	XW4Z-EA	3.01-3.16 mm (0.118-0.124 in)	Two
2.23-2.43 mm (0.088-0.096 in)	XW4Z-FA	3.21-3.36 mm (0.126-0.132 in)	Three

47. **NOTE:** Make sure that the intermediate band apply strut is aligned with the band notch.

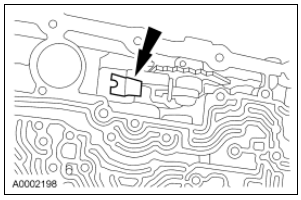
    NOTE: If the intermediate band is reused, it must be installed in the same position as when removed.

    NOTE: The new intermediate band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

    Install the intermediate band.



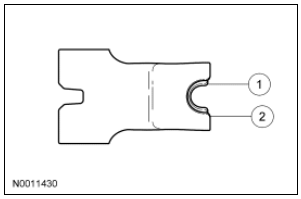
48. Install the intermediate band anchor strut.



49. ⚠ **CAUTION: To avoid a "fall-out" condition of the strut from the screw during assembly and function, the small "U" shape notch should be toward the band/case side and the large "U" shape notch toward the main control side.**

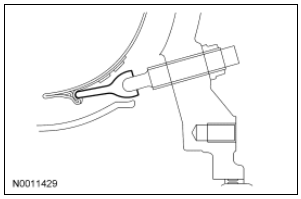
    Position the strut in the transmission case.

    1. Band/case side of the anchor (small U notch).
    2. Main control side of the anchor (large U notch).

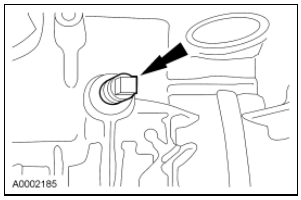


50. ⚠ **CAUTION: If the strut is installed incorrectly, transmission damage will occur.**

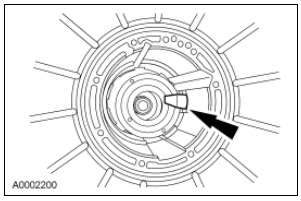
    Check to make sure that the intermediate band anchor strut is installed in the correct orientation to the case and adjustment screw.



51. Loosely install the screw.

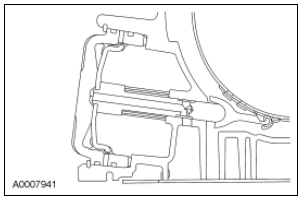


52. Install the intermediate band apply strut.

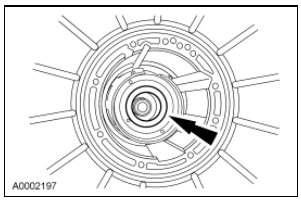


53. ⚠ **CAUTION: If the strut is installed incorrectly, transmission damage will occur.**

    Check to make sure that the intermediate band apply strut is installed in the correct orientation to the case and piston rod.

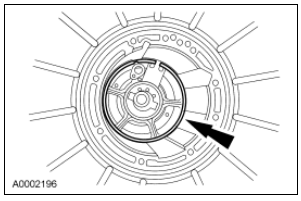


54. Install the selected No. 4 thrust washer on the direct clutch drum.
    - Coat the thrust washer with petroleum jelly.

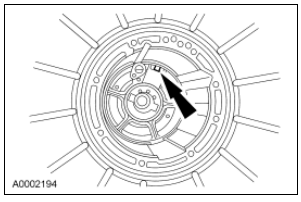


55. **NOTE:** Align the center support screw hole with correct case hole.

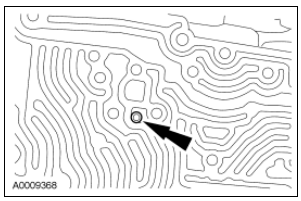
    Install the center support.



56. Install the center support locknut and cage.



57. Loosely install the screw.

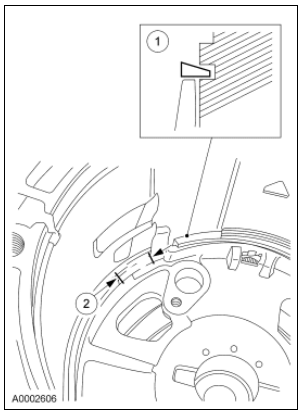


58. **CAUTION: Install the center support retaining ring with the tapered side facing up.**

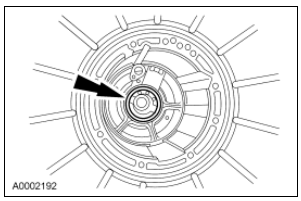
    CAUTION: Make sure the notch opening is not obstructed by the center support retaining ring.

    Install the center support retaining ring.

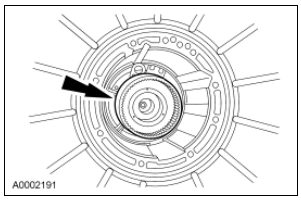
    1. Make sure the center support retaining ring is installed with the tapered side facing up.
    2. Make sure the opening of the center support retaining ring is positioned correctly.



59. Install the center shaft thrust bearing (No. 3).

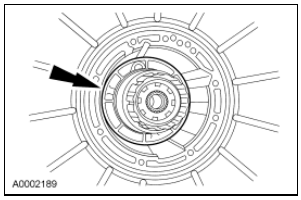


60. Install the overdrive ring gear, overdrive one-way clutch and center shaft assembly.

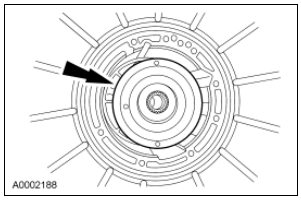


61. **CAUTION: Do not bend the trigger wheel. Make sure that the No. 2 thrust bearing is in this assembly.**

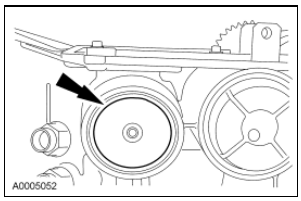
    Install the planetary gear overdrive carrier.



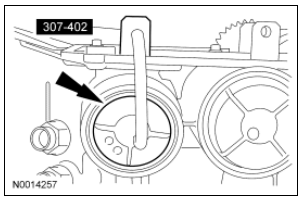
62. Install the overdrive brake drum and coast clutch drum assembly.



63. Install the overdrive band servo piston and spring.
    - Lubricate the servo bore with clean automatic transmission fluid.



64. Using the special tools, install the retaining ring.

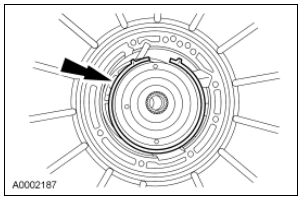


65. **NOTE:** If the overdrive band is reused, it must be installed in the same position as when removed.

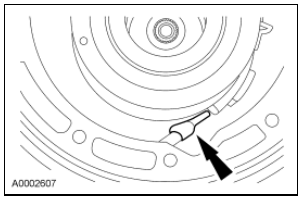
    NOTE: Make sure that the overdrive band apply strut is aligned with the band notch.

    NOTE: The new overdrive band is dark in color. This is a normal condition of the band. Hairline cracks in the band are also considered normal. Do not install a new band based solely on the color.

    Install the overdrive band.



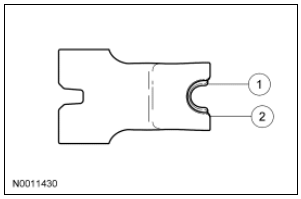
66. Install the overdrive anchor strut.



67. ⚠ **CAUTION: To avoid a "fall-out" condition of the strut from the screw during assembly and function, the small "U" shape notch should be toward the band/case side and the large "U" shape notch toward the main control side.**

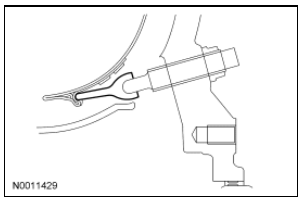
    Position the strut in the transmission case.

    1. Band/case side of the anchor (small U notch).
    2. Main control side of the anchor (large U notch).



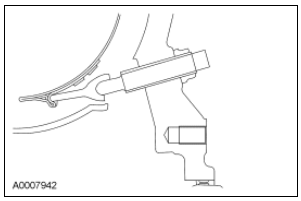
68. ⚠ **CAUTION: If the strut is installed incorrectly, transmission damage will occur.**

    Check to make sure that the intermediate band anchor strut is installed in the correct orientation to the case and adjustment screw.

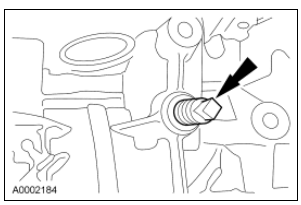


69. ⚠ **CAUTION: If the strut is installed incorrectly, transmission damage will occur.**

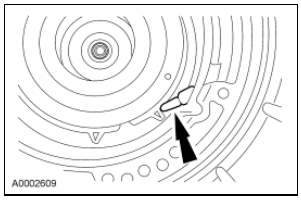
    Check to make sure that the overdrive band anchor strut is installed in the correct orientation to the case and adjustment screw.



70. Loosely install the screw.

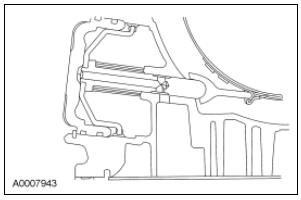


71. Install the overdrive apply strut.



72. ⚠ **CAUTION: If the strut is installed incorrectly, transmission damage will occur.**

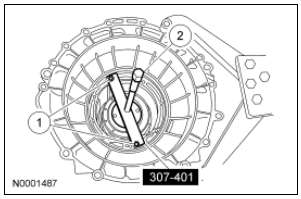
    Check to make sure that the overdrive band apply strut is installed in the correct orientation to the case and piston rod.



73. ⚠ **CAUTION: The torque specifications are critical for this procedure. Failure to use the correct torque specifications may cause transmission damage.**

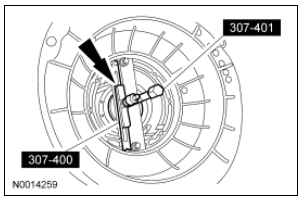
    Install the special tool.

    1. Install the special tool and the bolts using the 2 pump screw locations at approximately 6 and 12 o'clock positions.
        - ♦ Tighten to 15 Nm (11 lb-ft).
    2. Tighten the center screw.
        - ♦ Tighten to 1 Nm (10 lb-in).



74. **NOTE:** Align the disc holes on special tool with the slot in gauge bar for correct measurement.

    Measure the distance from the top of the gauge bar to the drum bearing surface through the hole in the disc and record as dimension A. Repeat measurement 180 degrees opposite side of the special tool and record as dimension B.



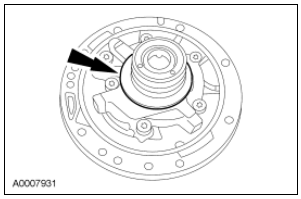
75. Add dimension A to B, divide by 2 and record as dimension C.

76. Subtract the thickness of the gauge bar 17.78 mm (0.71 in) from dimension C, and record as dimension D.

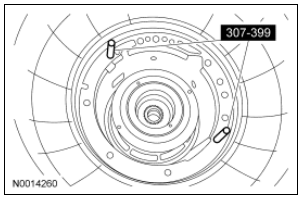
77. Select the No. 1 thrust bearing from the following chart using dimension D.

Dimension D	Service Part Number (7D014)	Bearing Thickness	Identification (Color/ID)
38.05-38.13 mm (1.50 in)	F7TZ-TA	1.55-1.60 mm (0.061-0.063 in)	White
38.14-38.28 mm (1.50-1.51 in)	F7TZ-MA	1.75-1.80 mm (0.069-0.071 in)	Green
38.29-38.42 mm (1.51 in)	F7TZ-NA	1.85-1.90 mm (0.073-0.075 in)	Red
38.43-38.61 mm (1.51-1.52 in)	F7TZ-RA	2.05-2.10 mm (0.081-0.083 in)	Black
38.62-38.74 mm (1.52-1.53 in)	F7TZ-SA	2.15-2.20 mm (0.095-0.097 in)	Yellow

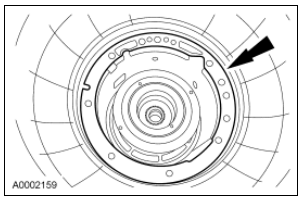
78. Install the selected No. 1 fluid pump input thrust washer.
    - Coat the fluid pump input thrust washer with petroleum jelly.



79. Install the special tools into the transmission case.

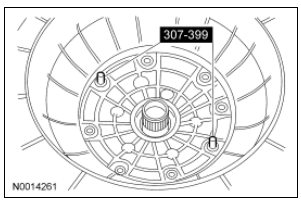


80. Install the pump gasket.



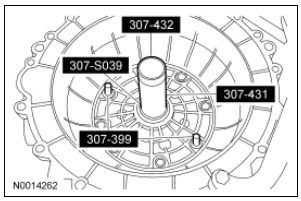
81. ⚠ **CAUTION: Make sure that the fluid pump inlet thrust washer (No. 1), selective thrust washer, fluid pump gasket and the fluid pump-to-case O-ring seal remain in the correct position throughout this step.**

    Install the fluid pump.

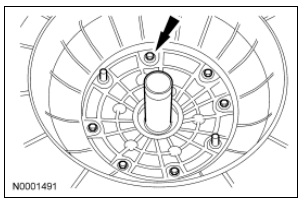


82. ⚠ **CAUTION: The special tools must be used to correctly align the pump with the adapter plate to reduce gear noise, bushing failure and leakage.**

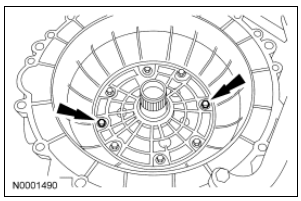
    Using the special tool, align the fluid pump to the adapter plate.



83. Install screws. Tighten the screws in a star pattern.
    - Tighten to 25 Nm (18 lb-ft).



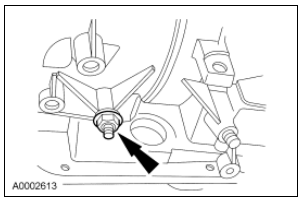
84. Remove the special tools and install the 2 remaining screws.
    - Tighten to 25 Nm (18 lb-ft).



85. ⚠ **CAUTION: Do not allow overdrive band adjustment screw to back out. Band strut could fall out of position.**

    ⚠ **CAUTION: Install, but do not tighten, a new locknut on the band adjustment screw. Apply petroleum jelly to the locknut seal.**

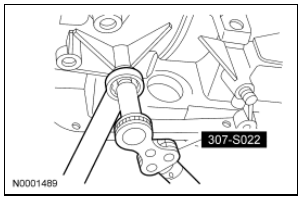
    Install a new locknut on the band adjustment screw.



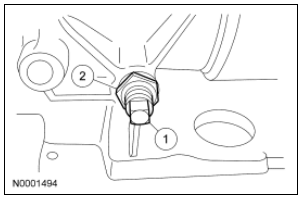
86. ⚠ **CAUTION: The overdrive servo must be installed prior to band adjustment.**

    Using the special tool, tighten the overdrive band adjustment screw. Then back off the screw exactly 1.5 turns and hold that position.

    - Tighten to 14 Nm (10 lb-ft).



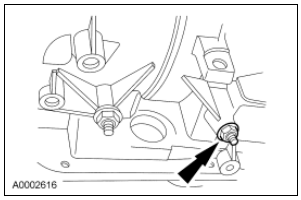
87. Tighten the overdrive band locknut.
    1. Hold the overdrive band adjustment screw stationary.
    2. Tighten the overdrive band locknut.
        - ♦ Tighten to 54 Nm (40 lb-ft).



88. ⚠ **CAUTION: Do not allow the intermediate band adjusting screw to back out. Band strut could fall out of position.**

    ⚠ **CAUTION: Install, but do not tighten, a new locknut on the band adjustment screw. Apply petroleum jelly to the locknut seal.**

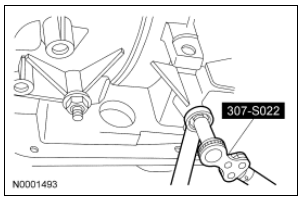
    Install new nut on the band adjustment screw.



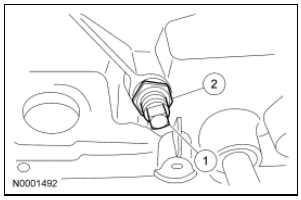
89. ⚠ **CAUTION: The intermediate servo must be installed prior to band adjustment.**

    Tighten the intermediate band adjustment screw. Then back off the screw exactly 1.5 turns and hold that position.

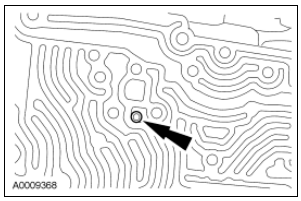
    - Tighten to 14 Nm (10 lb-ft).



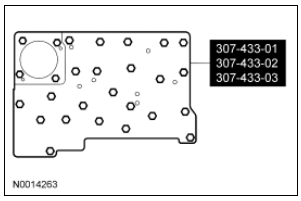
90. Tighten the intermediate band locknut.
    1. Hold the intermediate band adjustment screw stationary.
    2. Tighten the intermediate band locknut.
        - ♦ Tighten to 54 Nm (40 lb-ft).



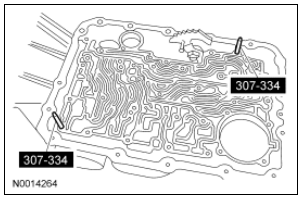
91. Tighten the center support screw.
    - Tighten to 11 Nm (8 lb-ft).



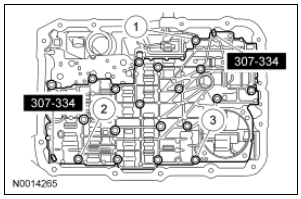
92. Using the special tools, carry out the air pressure test procedure. For additional information, refer to Special Testing Procedures in this section.



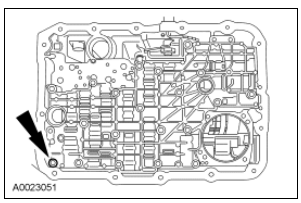
93. Install the special tools into the transmission case.



94. Using the special tools, install the main control valve body and loosely install the screws.
    1. Install the short screw.
    2. Install the screw with the larger head.
    3. Install the remaining screws.

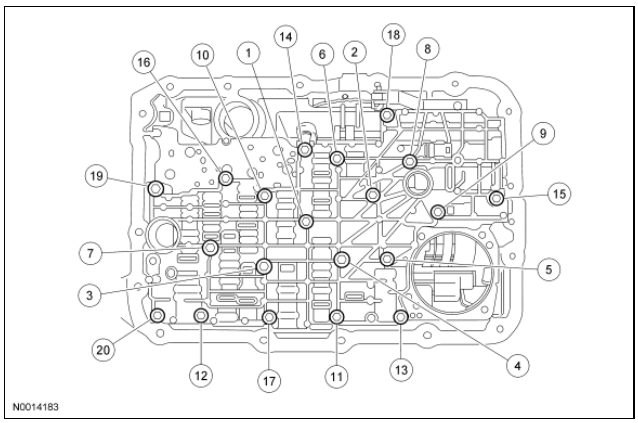


95. Remove the special tools, and loosely install the screw.

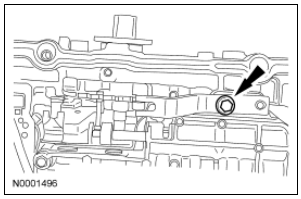


96. Tighten the screws in the sequence shown.

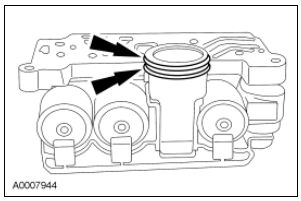
- Tighten to 10 Nm (89 lb-in).



97. With the manual lever in the NEUTRAL position, install the manual valve detent spring.
    - Tighten to 10 Nm (89 lb-in).



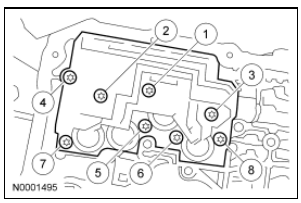
98. Install new O-ring seals on the solenoid body connector. Lubricate the O-ring seals with clean automatic transmission fluid.



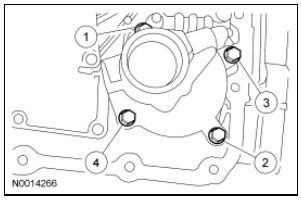
99. ⚠ **CAUTION: Inspect the transmission case bore to make sure it is free of debris and not damaged. If damaged, transmission leak may occur.**

    Install the solenoid body. Tighten the screws in sequence shown.

    - Tighten to 8 Nm (71 lb-in).



100. Install the reverse servo. Tighten the bolts in the sequence shown in 2 stages.
    - Stage 1: Tighten to 5 Nm (44 lb-in).
    - Stage 2: Tighten to 11 Nm (8 lb-ft).

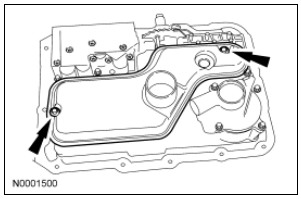


101. ⚠ **CAUTION: Lubricate the fluid filter seals with clean automatic transmission fluid or they may be damaged.**

    NOTE: Make sure that the fluid filter seals are correctly seated on the filter.

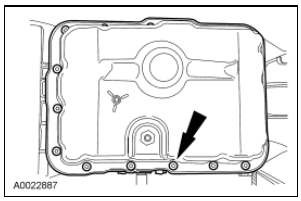
    Lubricate the seals and install the transmission fluid filter.

    - Tighten to 10 Nm (89 lb-in).

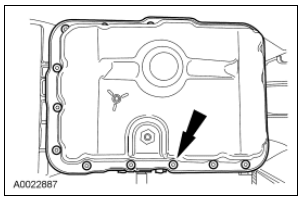


102. **NOTE:** The transmission fluid pan gasket is reusable. Clean and inspect for damage. If not damaged, the gasket should be reused.

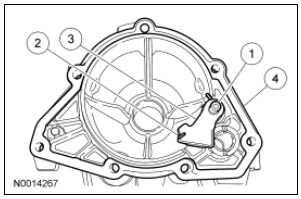
    Install the transmission fluid pan and gasket and loosely install the screws.



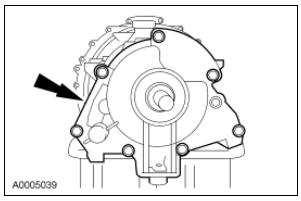
103. Tighten the 16 screws in a crisscross sequence.
    - Tighten to 11 Nm (8 lb-ft).



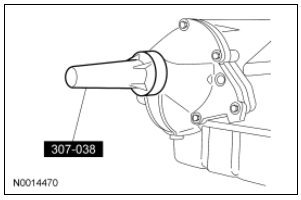
104. Install the parking pawl assembly and gasket.
    1. Install the parking pawl shaft.
    2. Install the parking pawl return spring.
    3. Install the parking pawl.
    4. Install a new gasket.



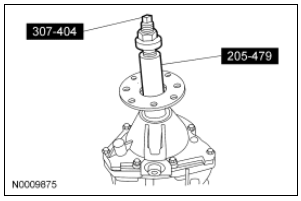
105. Install the extension housing.
    - Tighten to 25 Nm (18 lb-ft).



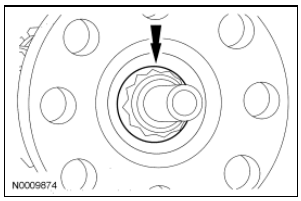
106. Using the special tool, install the extension housing seal.



107. Using the special tools, install the output shaft flange.

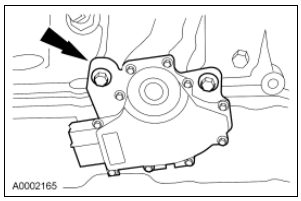


108. Install a new nut.
    - Tighten to 131 Nm (97 lb-ft).



109. ⚠ **CAUTION: The digital transmission range sensor must fit flush against the boss on the case to prevent damage to the sensor.**

    Install the digital transmission range (TR) sensor and loosely install the screws.

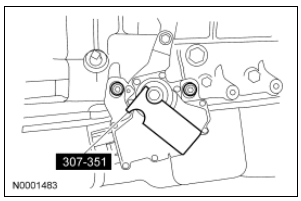


110. ⚠ **CAUTION: Tightening one screw before tightening the other may cause the sensor to bind or become damaged.**

    NOTE: The manual lever must be in the NEUTRAL position.

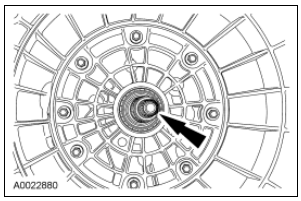
    Using the special tool, align the digital TR sensor and tighten the screws in an alternating sequence.

- Tighten 10 Nm (89 lb-in).

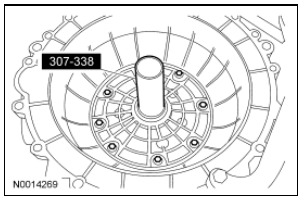


111. ⚠ **CAUTION: The splines of the input shaft are not the same length on both ends. The shaft end with the shorter splines goes into the fluid pump.**

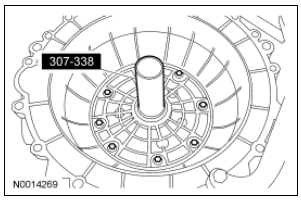
    Install the input shaft.



112. Using the special tool, make sure that the fluid pump gear seal ring is fully seated.



113. Remove the special tool.

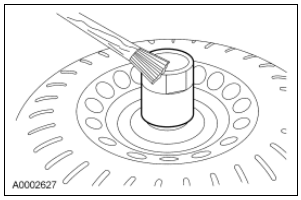


114. ⚠ **CAUTION: Do not damage the fluid pump gear O-ring seal when installing torque converter.**

    ⚠ **CAUTION: Make sure the converter hub is fully engaged in the pump support and gear and rotates freely. Do not damage the hub seal.**

    ⚠ **CAUTION: If the torque converter slides out, the hub seal may be damaged.**

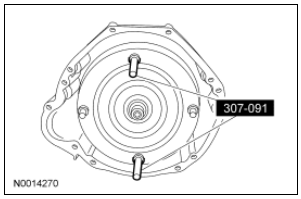
    Lubricate the converter hub with clean automatic transmission fluid.



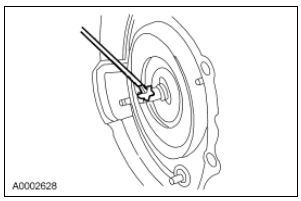
115. ⚠ **WARNING: The torque converter can fall out if the transmission is tipped. Failure to follow**

these instructions may cause personal injury.

Using the special tools, install the torque converter by pushing and rotating.



116. Lubricate the torque converter pilot hub with multi-purpose grease.



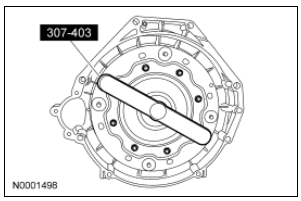
117. ⚠ **CAUTION: The special tool must be used to correctly align the adapter plate to the converter or transmission damage could occur.**

In order to correctly install the special service tool, it must be installed using one round and one oblong hole. Using two oblong holes will cause damage to the transmission.

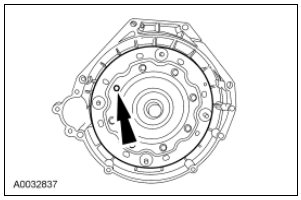
NOTE: Position the adapter plate on the torque converter and identify the position of the orange or green paint daub on the converter face.

If the vehicle is equipped, use the special tool to install the torque converter flex plate adapter assembly and 8 nuts.

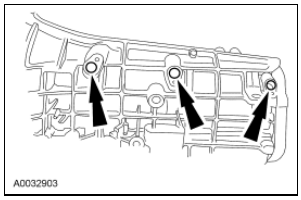
- Tighten to 44 Nm (33 lb-ft).



118. Remove the special tool and install the remaining torque converter flex plate adapter nuts.
    - Tighten to 44 Nm (33 lb-ft).



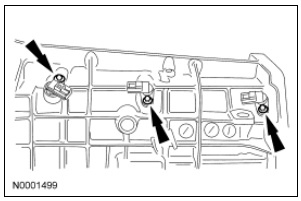
119. Using one of the speed sensor holes, fill the transmission with 8.5L (9 quarts) of automatic transmission fluid.



120. **NOTE:** Inspect O-ring seal for damage. Install new if damaged. Lubricate the O-ring seals with petroleum jelly to prevent damage to the O-ring seals.

    Install the sensors.

    - Tighten to 10 Nm (89 lb-in).



Transmission

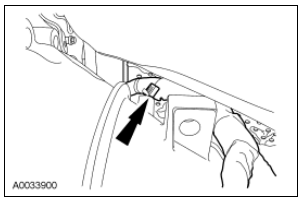
19	9F472	Heated oxygen sensor electrical connector (part of 9F427)
20	7005	Transmission assembly
21		Output shaft flange coupler
22		Output shaft flange coupler screws

1. ⚠ **WARNING: Secure the transmission to the transmission jack with a safety chain. Failure to follow these instructions can result in personal injury.**

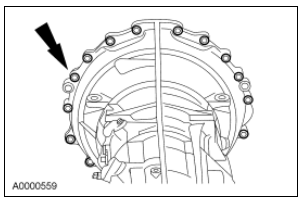
   Secure the transmission to the transmission jack with a safety chain.

2. **NOTE:** Rotate the torque converter so that the torque converter paint mark is in the 12 o'clock position.

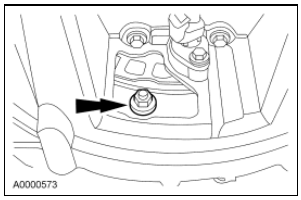
   While raising and positioning the transmission to the engine, install the wire harness to the top of the transmission.



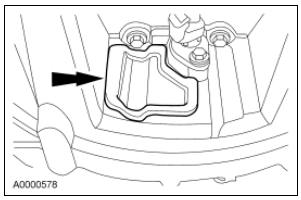
3. Carefully position the transmission in alignment with the engine and install the transmission bellhousing-to-engine screws
   - Tighten to 48 Nm (35 lb-ft).



4. Install the torque converter nuts.
   - Tighten to 35 Nm (26 lb-ft).



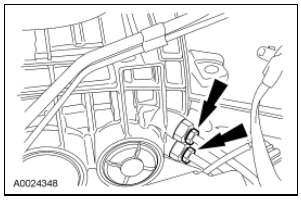
5. Install the converter access cover.



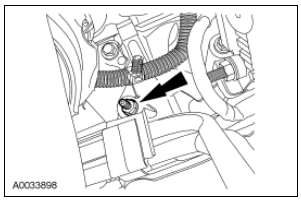
6. ⚠ **CAUTION: Do not damage the cooler tubes. Hold the transmission case fitting with a wrench.**

   Connect the transmission cooler tubes.

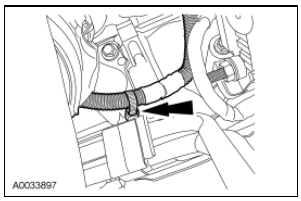
   - Tighten to 35 Nm (26 lb-ft).



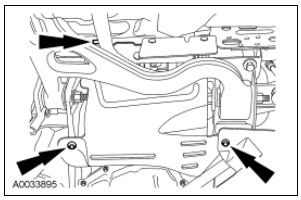
7. Install the cooler line bracket.
    1. Tighten to 18 Nm (13 lb-ft).



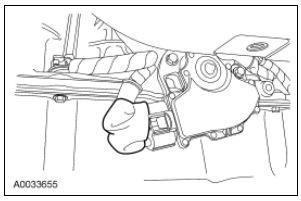
8. Connect the wire harness to the cooler line bracket.



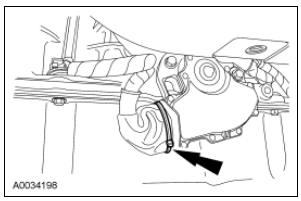
9. Install the splash shield, then install the screws and pushpin.



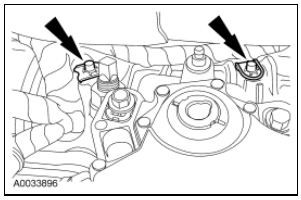
10. Reconnect the digital TR sensor connector.



11. Slide the boot over the digital TR sensor connector and install a new tie strap.



12. Connect the wire harness retainers to the transmission.



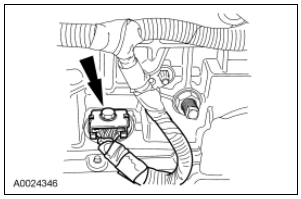
13. **CAUTION: Damage will occur to the solenoid body assembly if the screw is tightened above the specification.**

    NOTE: Always install new O-ring seals on the vehicle harness connector.

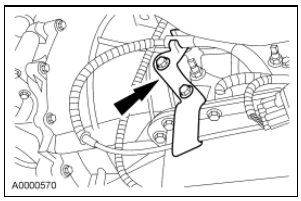
    NOTE: Use petroleum jelly to lubricate the O-ring seals to aid in the installation process.

    Install and lubricate new O-ring seals on the transmission connector and connect the connector.

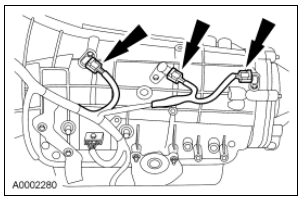
    - Tighten to 5 Nm (44 lb-in).



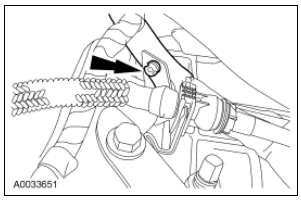
14. Install the shift cable bracket screws and bracket.
    - Tighten to 25 Nm (18 lb-ft).



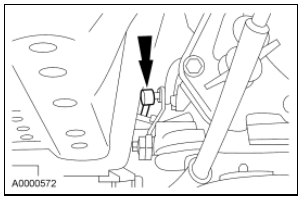
15. Connect the TSS, OSS and ISS electrical connectors.



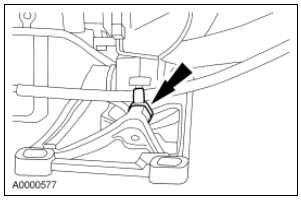
16. Install the wire harness to the top of the transmission shift cable bracket.



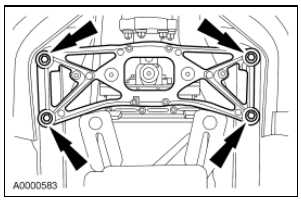
17. Connect the transmission shift cable eyelet to the manual lever.



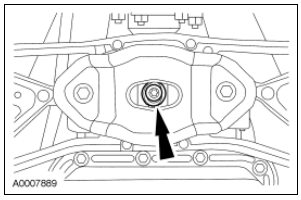
18. Install the shift cable to the rear transmission support.



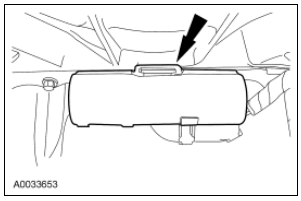
19. Position the rear transmission support and install the screws.
    - Tighten to 55 Nm (41 lb-ft).



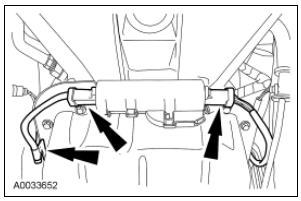
20. Install the transmission support center screw.
    - Tighten to 40 Nm (30 lb-ft).



21. Install the heated oxygen sensor connector on the front of the transmission pan rail.



22. Install the wire in the clip on the right side of the transmission pan rail and connect the heated oxygen sensors.



23. Install the driveshaft. For additional information, refer to Section 205-01 .

24. Install the exhaust system and front heat shields. For additional information, refer to Section 309-00 .

25. **NOTE:** When the battery has been disconnected and reconnected, some abnormal drive symptoms can occur while the vehicle relearns its adaptive strategy. The customer needs to be notified that they can experience slightly different upshifts (either soft or firm) and that this is a temporary condition and will eventually return to normal operating condition.

    Connect the battery ground cable. For additional information, refer to Section 414-01 .

26. Use the following guidelines for the in-line transmission fluid filter:
    - If the transmission was overhauled and the vehicle was equipped with an in-line fluid filter, install a new in-line fluid filter.
    - If the transmission was overhauled and the vehicle was not equipped with an in-line fluid filter, install a new in-line fluid filter kit.
    - If the transmission is being installed for a non-internal repair, do not install an in-line filter or filter kit.
    - If installing a new or a Ford-authorized remanufactured transmission, install the in-line transmission fluid filter that is supplied.
      Prior to lowering the vehicle, install a new in-line transmission filter or a filter kit. For additional information refer to Transmission Fluid In-Line Filter in this section.

27. Carry out the fluid level check. For additional information, refer to Transmission Fluid Level Check in this section.

28. Verify that the shift cable is correctly adjusted. For additional information, refer to Section 307-05 in this section.

29. Check the operation of the transmission and inspect for leaks.

Nut retaining the fluid cooler tube bracket to the stud (V8 engine)	18	13	
Nut retaining the fluid cooler tube bracket to the stud (V6 engine)	10		89
Nut retaining the fluid cooler tube to the transmission	35	26	
Hose clamp retaining the transmission fluid cooler hose to the transmission fluid cooler tube	5		44

Transmission Cooling

Printable View (7 KB)

The transmission fluid cooler is an oil-to-air (OTA) fluid cooler. The fluid cooler is mounted between the radiator and the A/C condenser.

- When the transmission fluid is cold and the thermostatic valve is closed, the transmission fluid does not circulate through the fluid cooler.
- As the transmission fluid temperature increases, the thermostatic bypass valve opens and allows the transmission fluid to circulate through the fluid cooler.

Transmission Cooling

Printable View (12 KB)

⚠ CAUTION: Whenever a transmission has been disassembled to install new parts, a new transmission fluid cooler must be installed and the transmission fluid cooler tubes must be cleaned and backflushed.

NOTE: Cleaning and backflushing the transmission fluid cooling system, along with normal cleaning and inspection procedures as outlined in this section during disassembly and reassembly, will keep contamination from re-entering the transmission and causing a repeat repair.

When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the torque converter and transmission fluid cooler. These contaminants are a major cause of recurring transmission troubles and must be removed from the system before the transmission is put back in use.

Inspection and Verification

When fluid leakage is found in the fluid cooler, install a new fluid cooler.

When there is evidence of transmission assembly or fluid contamination due to the following transmission failure modes, install a new fluid cooler.

- Major metallic failure
- Multiple clutches or clutch plate failure
- Sufficient component wear which results in metallic contamination

Symptom Chart

Symptom Chart

Transmission Fluid Cooler Backflushing and Cleaning

Printable View (18 KB)

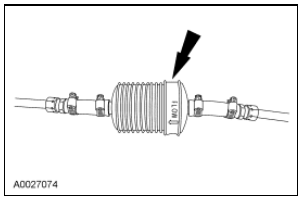
⚠ CAUTION: Whenever a transmission has been disassembled to install new parts or a new or remanufactured transmission has been installed, a new transmission fluid cooler (either in-tank, auxiliary or OTA) if equipped, will need to be installed. Using a suitable torque converter/fluid cooler cleaner, clean and backflush the transmission fluid cooler tubes.

⚠ CAUTION: Use only clean automatic transmission fluid specified for this transmission. Do not use supplemental fluid additives, treatments or cleaning agents. The use of these materials may affect transmission operation and result in internal damage to the transmission.

⚠ CAUTION: When internal wear or damage has occurred in the transmission, metal particles, clutch plate material or band material may have been carried into the transmission fluid cooler. These contaminants are a major cause of recurring transmission concerns and must be removed from the system before the transmission is put back into use.

1. Carry out backflushing with a suitable torque converter/transmission fluid cooler cleaner. Test the equipment to make sure that a vigorous fluid flow is present before proceeding. Install a new system filter if flow is weak or contaminated.

2. If equipped, remove and discard the transmission fluid in-line filter.



3. To aid in attaching the cleaner to the transmission steel cooler lines, connect 2 additional rubber hoses to the transmission end of the steel transmission cooler lines as described.
   - Connect the cleaner tank pressure line to the steel transmission cooler return line (longest line).
   - Connect a tank return hose to the steel transmission cooler pressure line (shorter line). Place the outlet end of this hose in the solvent tank reservoir.

4. Turn on the pump and allow the clean transmission fluid to circulate a minimum of 5 minutes (cycling the switch on and off will help dislodge the contaminants in the cooler system).

5. Switch off the pump and disconnect the pressure hose from the transmission cooler return line.

6. Use compressed air to blow out the cooler(s) and lines (blow air into the transmission cooler return line) until all fluid is removed.

7. Remove the rubber return hose from the remaining steel cooler line.

Transmission Fluid Cooler Flow Test

Printable View (89 KB)

Special Tool(s)

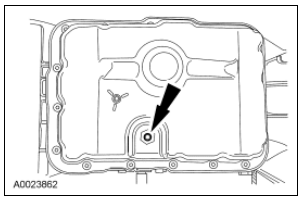
 ST2581-A	Transmission Fluid Fill Tool 307-437

NOTE: The engine idle, transmission linkage/cable adjustment, fluid level and line pressure must be within specification before carrying out this test. Refer to Section 307-05 for adjustments. For additional information on engine idle diagnosis, refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. For additional information on fluid level check, refer to Section 307-01 . For additional information on line pressure, refer to Section 307-01 .

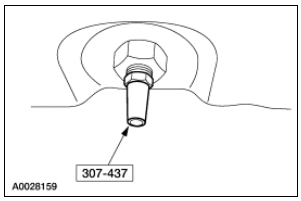
1. Place the transmission range selector lever into PARK.

2. Raise the vehicle on a hoist and place suitable safety stands under the vehicle. For additional information, refer to Section 100-02 .

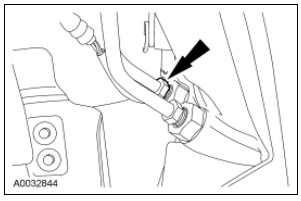
3. Hold the large drain plug with a wrench, and remove the small (center) fluid level indicating plug using a 3/16-inch Allen key.



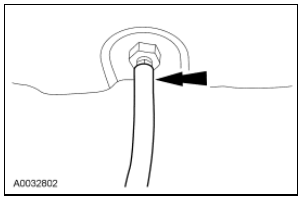
4. Install the special tool into the pan.



5. Remove the cooler return line (upper line) from the fitting on the transmission case.



6. Connect one end of a clear hose to the cooler return line and route the other end of the hose to the special tool in the pan.



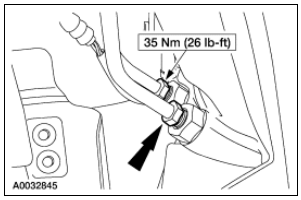
7. Remove the safety stands and lower the vehicle.

8. Start the engine and run it at idle.

9. With the engine running, raise the vehicle on a hoist and place suitable safety stands under the vehicle. For additional information, refer to Section 100-02 .

10. Once a steady flow of fluid (without air bubbles) is observed, remove the hose from the special tool and place the hose in a measuring container for 15 seconds. After 15 seconds, place the hose back onto the special tool. Lower the vehicle and turn the engine off. Measure the amount of fluid in the container. If adequate flow was observed, approximately 208 ml (7 oz) will be in the measuring container. The test is complete. Reconnect the cooler line and install the fluid fill plug.

11. If the flow is not liberal, disconnect the hose from the cooler return line and connect the hose to the cooler inlet (lower fitting) on the transmission case. Reconnect the cooler return line to the case (upper fitting).



12. Repeat Steps 8 through 10. If flow is now approximately 208 ml (7 oz) in 15 seconds, the cooler lines and auxiliary cooler must be cleaned. For additional information, refer to Transmission Fluid Cooler - Backflushing and Cleaning in this section. Carry out this entire test after the backflushing and cleaning procedure. If, after carrying out the backflushing and cleaning procedure, the flow is still not adequate, new cooler lines and/or an auxiliary cooler must be installed. If the flow from the case is still not adequate after the installation of new cooler lines and/or an auxiliary cooler (208 ml [7 oz] in 15 seconds), the pump and/or torque converter may be at fault. Carry out the appropriate procedures for diagnosis and repair in this section.

Combination Fluid Cooler

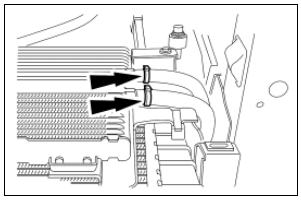
Printable View (110 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)

Removal

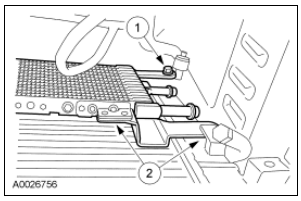
1. Remove the A/C condenser core. For additional information, refer to Section 412-03 .
2. Remove and discard the six hose clamps.



3. **NOTE:** Position a drain pan under the vehicle to catch any fluid that may spill.

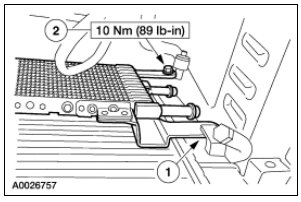
   Disconnect the six hoses from the cooler. Plug the hoses and the cooler.

4. Remove the cooler.
   1. Remove the two bolts.
   2. Lift the cooler from the retainers and remove the cooler.

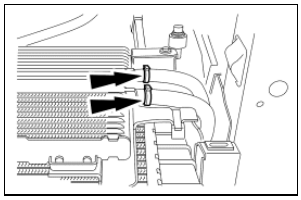


Installation

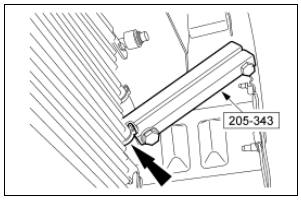
1. Install the cooler.
   1. Position the cooler on the retainers.
   2. Install the two bolts.



2. Position new hose clamps on the six hoses.
3. Remove the plugs from the six hoses and the cooler. Connect the six hoses to the cooler.



4. Using the special tool, tighten the six hose clamps.



5. Install the A/C condenser. For additional information, refer to Section 412-03 .

6. Fill and leak check the power steering system. For additional information, refer to Section 211-00 .

7. Fill and leak check the cooling fan system. For additional information, refer to Section 303-03 .

8. Fill the automatic transmission and leak check the cooling system. For additional information, refer to Section 307-01 .

Transmission Fluid Cooler Tubes

Printable View (266 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Joint Boot Clamp 205-343 (T95P-3514-A)

Removal

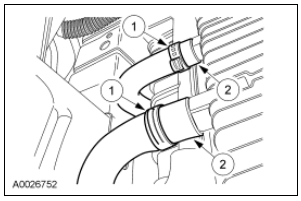
NOTE: This procedure describes the removal and installation of all the transmission cooling system tubes and hoses. Only disconnect those that require removal from the vehicle.

Hose removal

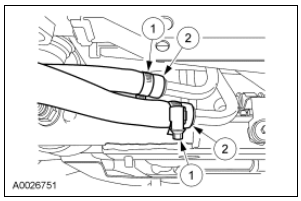
NOTE: Proceed to Disconnecting the tubes in this section if only removing the transmission fluid cooler tubes from the vehicle.

1. Remove the A/C condenser core. For additional information, refer to Section 412-03 .

2. Disconnect the transmission fluid cooler hose from the cooler.
    1. Cut and discard the clamp.
    2. Disconnect the transmission fluid cooler hose from the cooler.



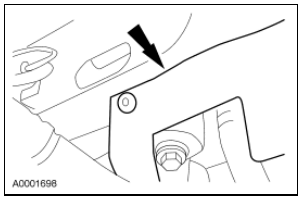
3. Disconnect the transmission fluid cooler hose from the transmission fluid cooler tube.
    1. Loosen and position the clamp aside.
    2. Disconnect the transmission fluid cooler hose from the transmission fluid cooler tube.
        - Proceed to Hose installation in this section if not removing the transmission fluid cooler tubes from the vehicle. Otherwise, proceed as follows.



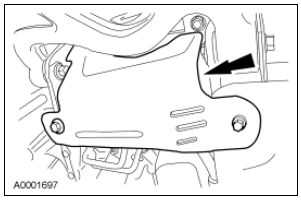
Disconnecting the tubes

4. If not done previously, raise and support the vehicle. For additional information, refer to Section 100-02 .

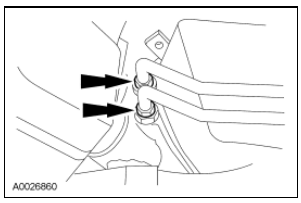
5. If not done previously, remove the LH splash shield pushpin.



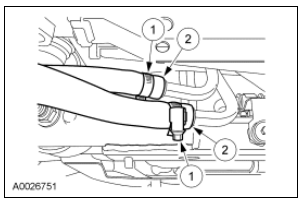
6. If not done previously, remove the bolts and the LH splash shield.



7. Disconnect the transmission fluid cooler tubes from the transmission.

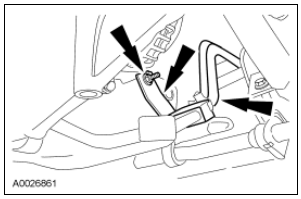


8. If not done previously, disconnect the transmission fluid cooler hoses from the transmission fluid cooler tubes.
    1. Loosen and position the clamps aside.
    2. Disconnect the transmission fluid cooler hoses from the transmission fluid cooler tubes.



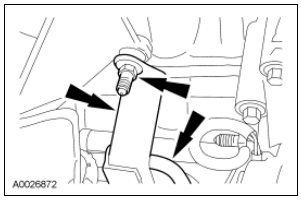
Tube removal, vehicle with V6 engine

9. Remove the nut, the fluid cooler tube bracket and the fluid cooler tubes.



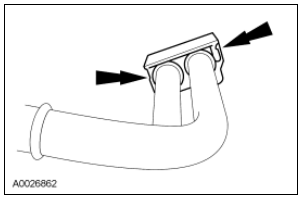
Tube removal, vehicle with V8 engine

10. Remove the nut, the fluid cooler tube bracket and the fluid cooler tubes.



Routing bracket removal

11. Remove the fluid cooler tube routing bracket from the fluid cooler tubes.

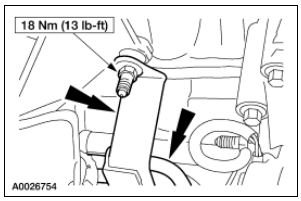


Installation

Tube installation, vehicle with V8 engine

NOTE: Proceed to Hose installation in this section if the transmission fluid cooler tubes were not removed from the vehicle.

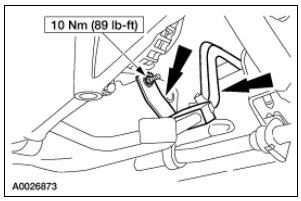
1. Position the transmission fluid cooler tubes and the fluid cooler tube bracket, and install the nut.



Tube installation, vehicle with V6 engine

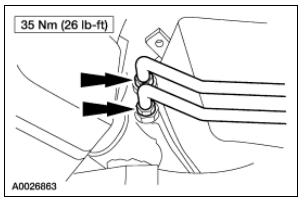
NOTE: Proceed to Hose installation in this section if the transmission fluid cooler tubes were not removed from the vehicle.

2. Position the transmission fluid cooler tubes and the fluid cooler tube bracket, and install the nut.



Connecting the tubes

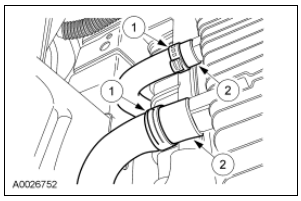
3. Connect the transmission fluid cooler tubes to the transmission.
    - Proceed to Connecting the hose(s) in this section if the transmission fluid cooler hoses were not removed from the vehicle. Otherwise, proceed as follows.



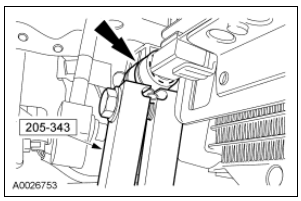
Hose installation

4. Connect the transmission fluid cooler hose(s) to the cooler.

1. Position the clamp on the transmission fluid cooler hose.
2. Connect the transmission fluid cooler hose to the cooler.

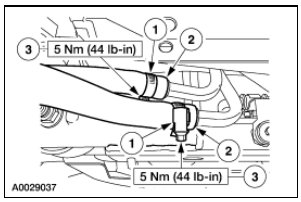


5. Using the special tool, tighten the clamp.
   - Repeat this step for the other hose clamp, if removed.



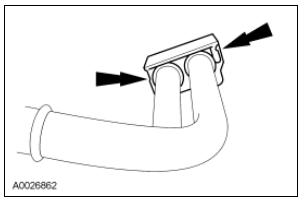
Connecting the hose(s)

6. Connect the transmission fluid cooler hose to the transmission fluid cooler tube.
   1. Position the clamp.
   2. Push the transmission fluid cooler hose onto the transmission fluid cooler tube until it is bottomed against the stop.
   3. Tighten the clamp.



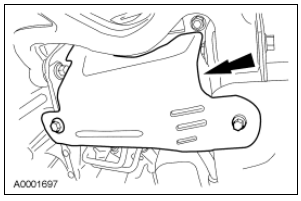
Final assembly

7. If removed, install the fluid cooler tube routing bracket.

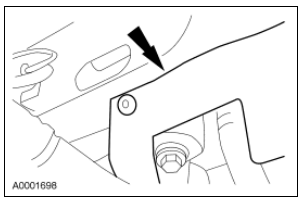


8. If removed, install the A/C condenser core. For additional information, refer to Section 412-03 .

9. Install the LH splash shield and the bolts.



10. Install LH splash shield pushpin.



11. Lower the vehicle.

12. Fill the automatic transmission and leak check the cooling system. For additional information, refer to Section 307-01 .

Bolt retaining the instrument panel steering column opening cover reinforcement to the instrument panel	4		38
Screw retaining ignition switch	4		38

External Controls

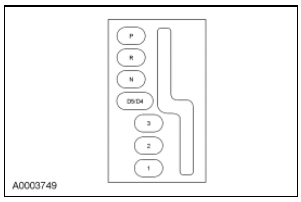
Printable View (25 KB)

The transmission shift cable transfers the transmission operating mode from the transmission range selector lever to the automatic transmission. For additional information, refer to Section 307-01 . The indicated position of the lever is transferred to the transmission through the cable and down to the manual control lever on the transmission. For additional information, refer to Section 307-01 .

Depending on the vehicle options selected the lever may have different range positions.

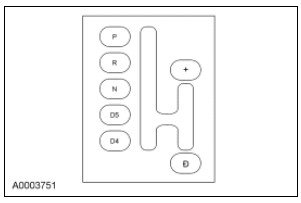
The standard lever has eight positions: P, R, N, D5, D4, 3, 2, and 1.

Base Range Shifter



The optional select shift transmission (SST) range selector lever has seven positions P, R, N, D5, or D4, + and -. The + and - option will allow the driver to manually upshift and downshift into any gear range.

Optional Range Shifter



Brake Shift Interlock System

The shift interlock system prevents shifting the transmission out of the PARK position unless the brake pedal is depressed. The shift interlock system consists of a shift lock actuator mounted on the ignition switch. The actuator is energized when the ignition switch is turned to RUN, locking the transmission range selector lever in the PARK position. When the brake pedal is applied and the brake pedal position (BPP) switch activated, the shift lock actuator is deactivated, allowing the selector lever to move out of the PARK position.

The ignition shift interlock cable locks the selector lever in the PARK position when the ignition switch is in the lock position. It also requires the selector lever to be in the PARK position in order to turn the ignition switch to the lock position.

Select Shift Transmission (SST) Switches (+ and -)

The positions indicated by a (+) or a (-) allow the driver to manually select the appropriate upshift (+) or downshift (-) and gear range.

The SST switches are located within the transmission range selector assembly and are momentary contact switches that send a signal to the powertrain control module (PCM) each time the driver moves the selector

lever into the upshift or downshift gear range.

The PCM uses the input signals from the SST+ and the SST- switches, along with other vehicle inputs, to determine which gear should be commanded.

Transmission Control Switch (TCS)

The TCS is a momentary contact switch that sends a signal to the PCM when the driver selects the D4 position, canceling operation of 5th (overdrive) gear.

The TCS is located within the range selector assembly for the base shifter only.

The PCM uses this signal to control the shift solenoids to disengage/disable 5th gear operation and activates coast clutch for the base shifter only. At the same time the PCM changes the instrument panel indicator to display D4.

When the driver moves the selector lever back to the D5 position, 5th gear operation is enabled, the coast clutch is released and the instrument panel indicator displays D5.

Park Sense Switch

The park sense switch prevents the redundant PRNDL from displaying "P" until the shifter is in the PARK position.

Electronic Transmission Error Indicator

The vehicle is equipped with a redundant electronic gearshift indicator. This character appears with the key in the RUN position and displays the same gear selection as shown on the selector lever floor console next to the range selector lever. If an "E" character flashes or remains on this indicates that a transmission malfunction has occurred.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent

Inspection and Verification

1. Verify the customer concern by operating the transmission external control.
2. Visually inspect for obvious signs of mechanical and electrical damage; refer to the following charts:

Visual Inspection Chart

Mechanical	Electrical
• Shift lock actuator • Transmission control switch • SST (+/-) switches • Shift cable and bracket • Park sense switch	• Central junction box (CJB) Fuse: ♦ 204 (5A) ♦ 205 (5A) • Damaged wiring harness • Loose or corroded connections • Powertrain control module (PCM)

Diagnostic Trouble Code Chart

Five Digit DTC	Compo-nent	Description	Condition	Symptom	Action
P0815	SST +/-	SST +/- circuit input signal failed.	PCM has detected an incorrect voltage SST input.	May not be able to shift in manual mode.	Go To Pinpoint Test C .
P1780	TCS	TCS input incorrect per selected position.	TCS voltage incorrect.	No overdrive cancel when range selector is moved.	Go To Pinpoint Test A .

3. If the concern is not visually evident, determine the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Tests

PINPOINT TEST A: OVERDRIVE CANCEL SWITCH IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK INPUT TO PCM	
• Key in OFF position. • Disconnect: PCM C175a. • Key in ON position. • Measure the voltage between PCM C175a pin 41, circuit 8-TA21 (WH/GN), harness side and ground.  A0005935 • **Is the voltage greater than 10 volts?**	**Yes** REFER to Section 413-01 . **No** GO to A2 .
A2 CHECK FOR VOLTAGE TO FUSE 205 (5A)	
• Key in ON position. • Measure the voltage between primary junction box fuse 205 (5A) input pin and ground.  A0005936 • **Is the voltage greater than 10 volts?**	**Yes** GO to A3 . **No** REPAIR the circuit. TEST the system for normal operation.
A3 CHECK FOR VOLTAGE INPUT TO THE SHIFTER	
• Key in OFF position. • Disconnect: Transmission Shift Selector C307. • Key in ON position. • Measure the voltage between transmission shift selector C307 pin 7, circuit 15-TA21 (GN/BK), harness side and ground.	**Yes** GO to A4 . **No** REPAIR circuit 15-DA5 (GN/OG) or 15-TA21 (GN/BK). TEST the system for normal operation.

 A0005937 • **Is the voltage greater than 10 volts?**	
A4 CHECK CIRCUIT 8-TA21 (WH/GN) FOR SHORT TO GROUND	
• Disconnect: PCM C175a. • Disconnect: Transmission Shift Selector C307. • Measure the resistance between transmission shift selector C307 pin 6, circuit 8-TA21 (WH/GN), harness side and ground.  A0005938 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A5 . **No** REPAIR the circuit. TEST the system for normal operation.
A5 CHECK CIRCUIT 8-TA21 (WH/GN) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between PCM C175a pin 41, circuit 8-TA21 (WH/GN), harness side and transmission shift selector C307 pin 6, circuit 8-TA21 (WH/GN), harness side.  A0005939 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new shifter harness. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

PINPOINT TEST B: THE PARK SWITCH IS INOPERATIVE

Test Step	Result / Action to Take
B1 CHECK CIRCUIT 15-TA34 (GN/YE) FOR OPEN	
• Disconnect: Transmission Shift Selector C307. • Key in ON position. • Measure the voltage between transmission shift selector C307 pin 3, circuit 15-TA34 (GN/YE), harness side and ground.	**Yes** GO to B2 . **No** REPAIR the circuit. TEST the system for normal operation.

 A0005940 • **Is the voltage greater than 10 volts?**	
B2 CHECK FOR VOLTAGE ON CIRCUIT 8-TA34 (WH)	
• Connect: Transmission Shift Selector C307. • Disconnect: Instrument Cluster C220b. • Select PARK. • Key in ON position. • Measure the voltage between instrument cluster C220b pin 8, circuit 8-TA34 (WH), harness side and ground.  A0005941 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . TEST the system for normal operation. **No** GO to B3 .
B3 CHECK CIRCUIT 8-TA34 (WH) FOR SHORT TO GROUND	
• Key in OFF position. • Disconnect: Transmission Shift Selector C307. • Measure the resistance between transmission shift selector C307 pin 8, circuit 8-TA34 (WH), harness side and ground.  A0005942 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B4 . **No** REPAIR the circuit. TEST the system for normal operation.
B4 CHECK CIRCUIT 8-TA34 (WH) FOR OPEN	
• Measure the resistance between transmission shift selector C307 pin 8, circuit 8-TA34 (WH), harness side and instrument cluster C220b pin 8, circuit 8-TA34 (WH), harness side.  A0005943	**Yes** INSTALL a new shifter harness. TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	

PINPOINT TEST C: THE TRANSMISSION MANUAL SHIFT (+/-) IS INOPERATIVE

Test Step	Result / Action to Take
C1 CHECK CIRCUITS 8-TA67 (WH/VT) AND 8-TA68 (WH/BK) INPUT TO THE PCM	
• Disconnect: PCM C175a. • Measure the resistance between PCM C175a pin 49, circuit 8-TA67 (WH/VT), harness side and ground; and between PCM C175a pin 50, circuit 8-TA68 (WH/BK), harness side and ground, while activating the shifter to the manual up and down position.  A0005947 • **Are the resistances less than 5 ohms?**	**Yes** GO to C4 . **No** GO to C2 .
C2 CHECK TRANSMISSION SHIFT SELECTOR CIRCUITS 31-TA67 (BK/WH) AND 31-TA68 (BK/RD) FOR OPEN	
• Disconnect: Transmission Shift Selector 307. • Measure the resistance between transmission shift selector C307 pin 9, circuit 31-TA67 (BK/WH), harness side and ground; and between shifter C307 pin 4, circuit 31-TA68 (BK/RD), harness side and ground.  A0008895 • **Are the resistances less than 5 ohms?**	**Yes** GO to C3 . **No** REPAIR the circuits. TEST the system for normal operation.
C3 CHECK CIRCUITS 8-TA67 (WH/VT) AND 8-TA68 (WH/BK) FOR OPEN	
• Measure the resistance between shifter C307 pin 10, circuit 8-TA67 (WH/VT), harness side and PCM C175a pin 49, circuit 8-TA67 (WH/VT) harness side; and C307 pin 5, circuit 8-TA68 (WH/BK), harness side, and PCM C175a pin 50, circuit 8-TA68 (WH/BK), harness side.  A0008896	**Yes** INSTALL a new shifter harness. TEST the system for normal operation. **No** REPAIR the circuits. TEST the system for normal operation.

• **Are the resistances less than 5 ohms?**	
C4 CHECK CIRCUITS 8-TA67 (WH/VT) AND 8-TA68 (WH/BK) FOR SHORT TO GROUND	
• Disconnect: Shifter C307. • Measure the resistance between PCM C175a pin 49, circuit 8-TA67 (WH/VT), harness side and ground; and between PCM C175a pin 50, circuit 8-TA68 (WH/BK), harness side and ground.  A0005947 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C5 . **No** REPAIR the circuit. TEST system for normal operation.
C5 CHECK THE TRANSMISSION SHIFT SELECTOR SWITCHES	
• Connect: Transmission Shift Selector C307. • Measure the resistance between PCM C175a pin 49, circuit 8-TA67 (WH/VT), harness side and ground; and between PCM C175a pin 50, circuit 8-TA68 (WH/BK), harness side and ground while activating the manual up and down position.  A0005947 • **Is the resistance less than 5 ohms with the switch on and greater than 10,000 ohms with the switch off?**	**Yes** INSTALL a new PCM. **No** INSTALL a new harness. TEST the system for normal operation.

PINPOINT TEST D: BRAKE SHIFT INTERLOCK INOPERATIVE

Test Step	Result / Action to Take
D1 CHECK FOR FEM DTCs	
• Retrieve FEM DTCs. Refer to Section 417-01 . • **Are any DTCs retrieved related to the brake switch?**	**Yes** REFER to Section 417-01 . **No** GO to D2 .
D2 CHECK FOR VOLTAGE ON CIRCUIT 7S-TA33 (YE/VT)	
• Key in OFF position. • Disconnect: Brake Shift Interlock C322. • Key in ON position. • Press and hold the brake pedal. • Measure the voltage between brake shift interlock C322 pin 2, circuit 7S-TA33 (YE/VT), harness side and ground.	**Yes** GO to D5 . **No** GO to D3 .

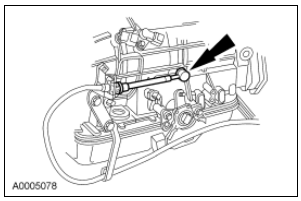
 A0005948 • **Is the voltage greater than 10 volts?**	
D3 CHECK CIRCUIT 75-TA33 (YE/VT) FOR SHORT TO GROUND	
• Disconnect: FEM C201f. • Measure the resistance between brake shift interlock C322 pin 2, circuit 7S-TA33 (YE/VT), harness side and ground.  A0005949 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D4 . **No** REPAIR the circuit. TEST the system for normal operation.
D4 CHECK CIRCUIT 7S-TA33 (YE/VT) FOR OPEN	
• Measure the resistance between brake shift interlock C322 pin 2, circuit 7S-TA33 (YE/VT), harness side and FEM C201f pin 15, circuit 7S-TA33 (YE/VT), harness side.  A0005950 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new FEM; REFER to Section 419-10 . **No** REPAIR the circuit. TEST the system for normal operation.
D5 CHECK CIRCUIT 31-TA33 (BK) FOR AN OPEN	
• Measure the resistance between brake shift interlock C322 pin 1, circuit 31-TA33 (BK), harness side and ground.  A0005951 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new brake shift interlock actuator; REFER to Brake Shift Interlock Actuator . TEST the system for normal operation. **No** REPAIR the circuit. TEST the system for normal operation.

Selector Lever Cable Adjustment

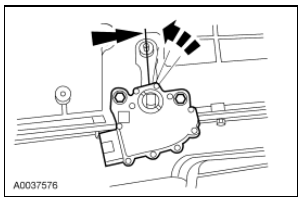
Printable View (102 KB)

Shift Cable

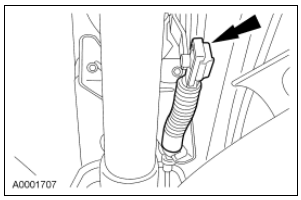
1. Place the selector lever in the D5 position.
2. Position the vehicle on a hoist. For additional information, refer to Section 100-02 .
3. Disconnect the transmission shift cable from the manual control lever.



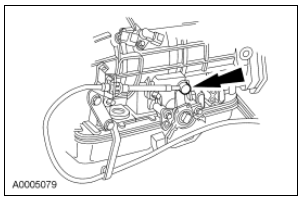
4. Place the manual control lever in the D5 position. This is 3 positions from the most rearward position.



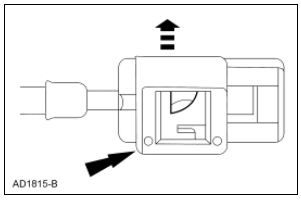
5. Disconnect the transmission shift cable from the selector lever.



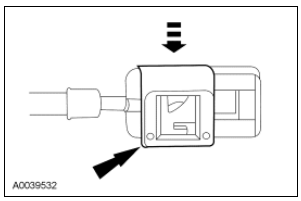
6. Connect the transmission shift cable to the manual control lever.



7. Unlock the adjuster at the end of the cable.



8. Connect the shift cable to the shifter and lock the end of the adjuster.



9. Carefully move the manual control lever from detent-to-detent and compare with transmission settings. Verify that the vehicle will start in PARK or NEUTRAL, and the backup lamps illuminate in REVERSE. If not, steps may need to be repeated and include digital transmission range (TR) sensor adjustment in NEUTRAL. For additional information on transmission range (TR) sensor adjustment, refer to Section 307-01 .
    - Adjust as necessary.

Brake Shift Interlock Actuator

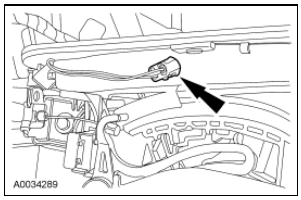
Printable View (357 KB)

Removal and Installation

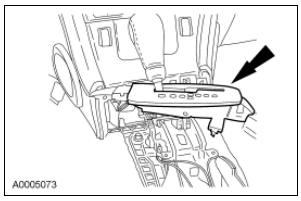
1. **NOTE:** If equipped with the traction control switch, the switch will need to be disconnected prior to removing the center console.

   Remove the center console. For additional information, refer to Section 501-12 .

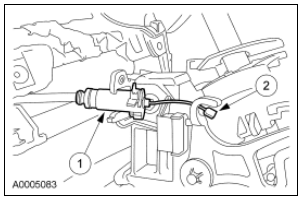
2. Remove the PRNDL indicator bulb from the electrical connector.



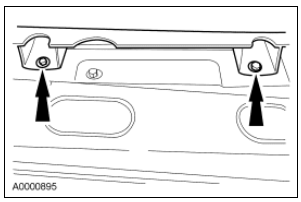
3. Rotate the shifter bezel.



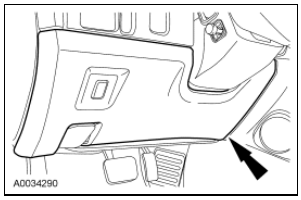
4. Disconnect the cable from the lever.
   1. Remove the shift interlock cable from the bracket.
   2. Disconnect the cable from the lever.



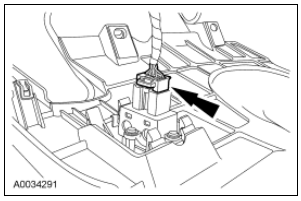
5. Remove the lower steering column cover push pins.



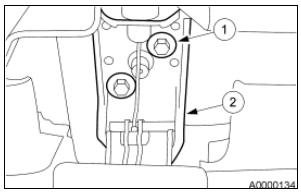
6. Remove the instrument panel steering column cover.



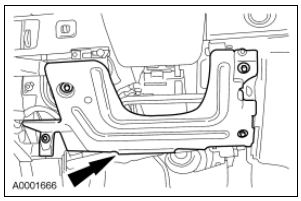
7. Disconnect the electrical connector.



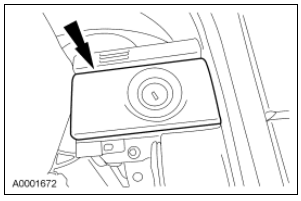
8. Position the hood release cable and bracket aside.
    1. Remove the screws.
    2. Position the hood release cable and bracket aside.



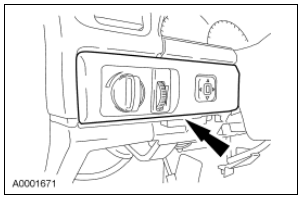
9. Remove the lower reinforcement panel.



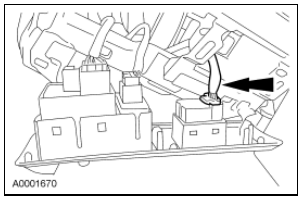
10. Remove the inner instrument panel finish panel.



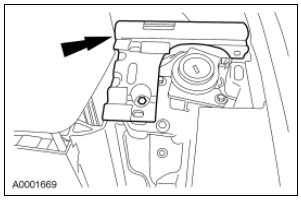
11. Remove the outer instrument panel finish panel.



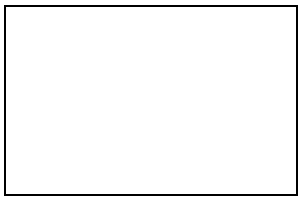
12. Disconnect the power mirror switch.



13. Remove the inner trim support panel.



14. Remove the ignition switch.
    - Remove the screws.
    - Remove the ignition switch.



15. Remove two screws for the shift lock actuator cable.
    - To install, tighten to 9 Nm (80 lb-in).

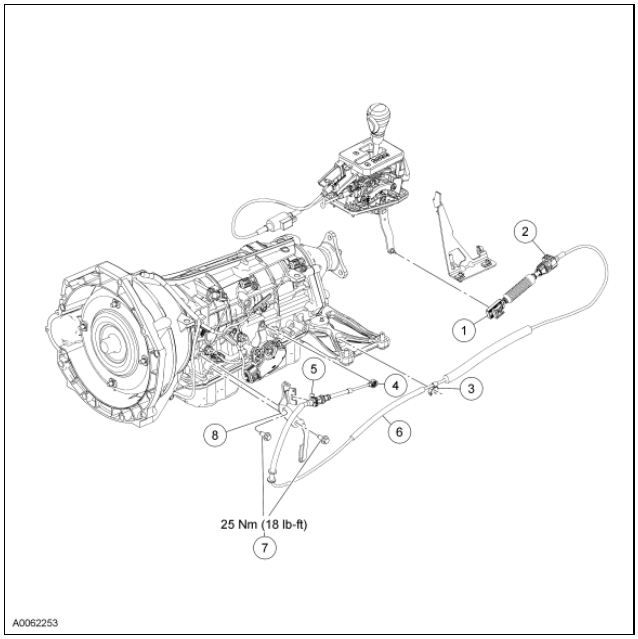
16. Disconnect the electrical connector from the brake shift interlock actuator cable.

17. Remove the cable from the bracket and remove the cable.

18. To install, reverse the removal procedure.

Selector Lever Cable

Printable View (220 KB)

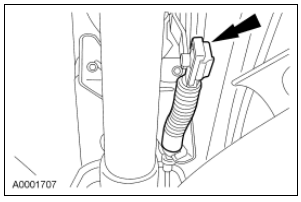


Item	Part Number	Description
1	7E395	Transmission selector lever cable eyelet
2	7E395	Transmission selector lever cable retainer
3	7E395	Transmission selector lever cable retainer
4	7E395	Transmission selector lever cable eyelet
5	7E395	Transmission selector lever cable retainer
6	7E395	Transmission selector lever cable
7	N605918-S	Transmission selector lever cable bracket screws
8	7B229	Transmission selector lever cable bracket

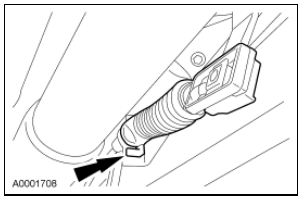
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Place the range selector lever in the D5 position.

3. Disconnect the transmission shift cable eyelet from the selector lever assembly.



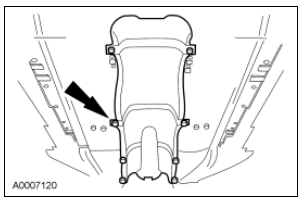
4. Disconnect the shift cable from the bracket.



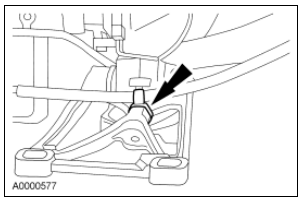
5. **NOTE:** It is not necessary to remove the exhaust.

   Remove the screws that retain the heat shield and lower the heat shield onto the exhaust.

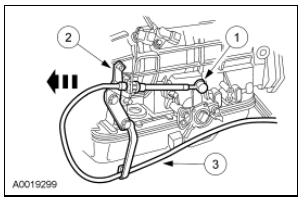
   - To install, tighten to 10 Nm (89 lb-in).



6. Disconnect the transmission shift cable retainer.



7. Remove the transmission shift cable.
   1. Disconnect the transmission cable eyelet from the manual control lever.
   2. Depress the tab and slide the transmission shift cable out of the shift cable bracket.
   3. Remove the transmission shift cable.



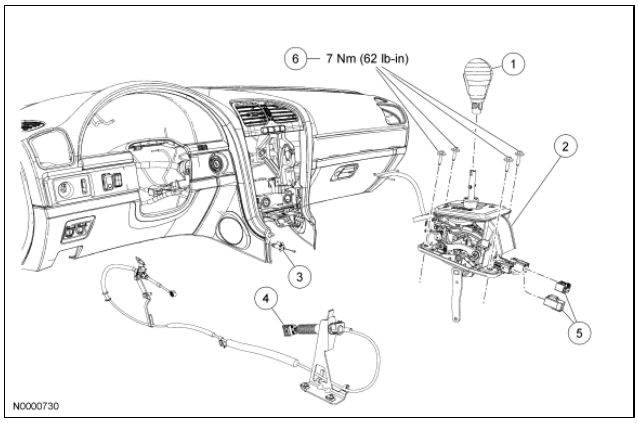
8. To install, reverse the removal procedure.

9. After installing the shift cable, it will be necessary to adjust the shift cable. For additional information, refer to Selector Lever Cable Adjustment in this section.

Transmission Selector Lever

Printable View (290 KB)

Removal and Installation



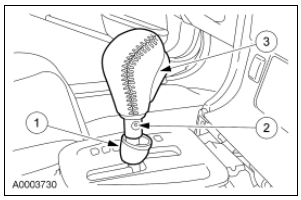
Item	Part Number	Description
1	7L010	Transmission selector lever handle
2	7E034	Transmission selector lever bezel
3	3F719	Transmission brake shift interlock actuator
4	7E395	Transmission selector lever cable
5	15A808	Transmission selector lever electrical connector
6	7C453	Transmission selector lever assembly bolts

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

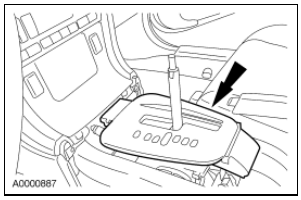
2. Place the range selector lever in the D5 position.

3. Remove the center console. For additional information, refer to Section 501-12 .

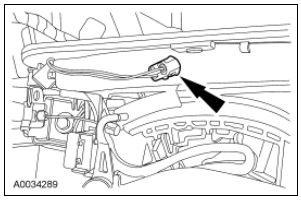
4. Remove the handle and cover.
    1. Slide the cover down.
    2. Remove the two screws.
    3. Remove the handle and the cover.



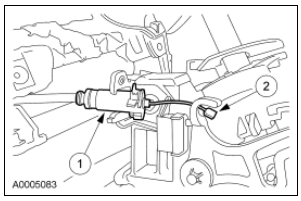
5. Move the shifter bezel aside.



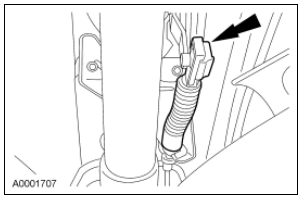
6. Remove the PRNDL indicator bulb from the electrical connector.



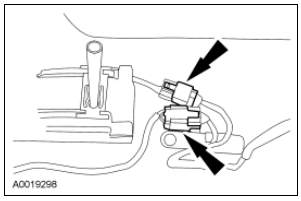
7. Disconnect the cable from the lever.
    1. Remove the shift interlock cable from the bracket.
    2. Disconnect the cable from the lever.



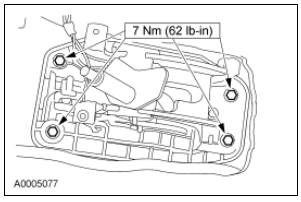
8. Disconnect the transmission shift cable from the shifter assembly.



9. Disconnect the 2 electrical connectors from the shifter assembly.



10. Remove the 4 screws from the shift lever assembly base.
    - To install, tighten to 7 Nm (62 lb-in).



11. **NOTE:** A selector lever cable adjustment must be carried out after installation. For additional information, refer to Selector Lever Cable Adjustment in this section.

To install, reverse the removal procedure.

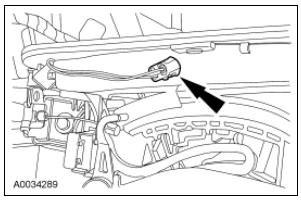
Transmission Control Switch

Printable View (82 KB)

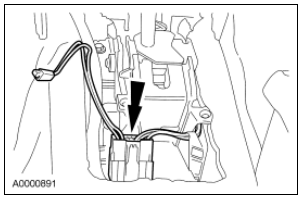
Removal and Installation

1. Remove the center console. For additional information, refer to Section 501-12 .

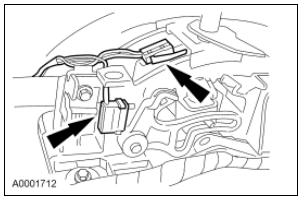
2. Remove the PRNDL indicator bulb from the electrical connector.



3. Disconnect the electrical connector.



4. Disconnect the switches and remove the harness.



5. To install, reverse the removal procedure.

Printable View (8 KB)

General Specifications

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (in Canada CXG-2B)	ESE-M12A4 A

Torque Specifications

Description	Nm	lb-ft	lb-in
3-way catalytic converter-to-exhaust manifold nuts (3.0L)	50	37	
3-way catalytic converter-to-exhaust manifold nuts (3.9L)	40	30	
Muffler and resonator assembly nuts	47	35	
Heat shield bolts and nuts	10		89
Worm clamp	7		62
Exhaust hanger bracket bolts	30	22	
Heated oxygen sensor	41	30	
Catalyst monitor sensor	41	30	

Exhaust System

Printable View (10 KB)

⚠ WARNING: The normal operating temperature of the exhaust system is very high. Never attempt to repair any part of the system until it has cooled. Be especially careful when working around the 3-way catalytic converter. The temperature of the 3-way catalytic converter rises to a high level after only a few minutes of engine operation. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: When repairing the exhaust system or removing exhaust components, disconnect all heated oxygen sensors (HO2S) at the wiring connectors to prevent damage to the HO2S and wiring harness. For additional information, refer to Section 303-14 for the location of the HO2S.

The exhaust system:

- contains dual 3-way catalytic converters.
- has a crossover pipe downstream of the 3-way catalytic converters.
- has two upstream HO2S mounted before the 3-way catalytic converters.
- has a production muffler and tailpipe assembly which is a one-piece design.

Exhaust System

Printable View (57 KB)

Special Tool(s)

ST1493-A	Exhaust Back Pressure Gauge 309-D002 (D95L-6000-A) or equivalent
 ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Inspection and Verification

1. Verify the concern by running the engine (with the vehicle on the ground) or road testing the vehicle to duplicate the condition.

2. Visually inspect the components of the exhaust system and related controls that may affect exhaust gas quality or loss of power.

3. Visually inspect for obvious signs of mechanical damage. Refer to the following chart.

Visual Inspection Chart

Mechanical
• Exhaust pipe pinched or crushed • Damaged muffler • Broken or damaged exhaust hanger brackets • Damaged catalytic converter • Cracked exhaust manifold • Dirty engine air cleaner • Loose or damaged heat shields

4. Verify that the exhaust system is installed correctly, with clamps correctly located and tightened to specification.

5. If the fault is not visually evident, determine the symptom. GO to Symptom Chart .

Symptom Chart

Symptom Chart

Pinpoint Test

NOTE: The vehicle can have a lack/loss of power, odor, a noise or a "no start" concern. These concerns may be related to the exhaust system. Carry out the following test, if no trouble codes were stored. This test is for diagnosing the source for these conditions.

PINPOINT TEST A: RESTRICTED EXHAUST SYSTEM TEST

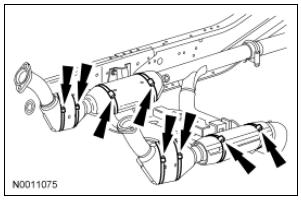
Test Step	Result / Action to Take
A1 EXHAUST SYSTEM INSPECTION	
• Inspect the exhaust system for damage or deterioration. Look for cracks, punctures, leaks, loose connections, dents or unusual bending. • **Is the exhaust system OK?**	**Yes** GO to A2 . **No** REPAIR or INSTALL any damaged or deteriorated exhaust components. Test the system for normal operation.
A2 BACK PRESSURE TEST	
• Position vehicle on a hoist. Refer to Section 100-02 . • Connect a tachometer. • Using the special tool, remove the upstream heated oxygen sensor (HO2S). • Install the back pressure gauge. • Start the engine and gradually increase the engine speed to 2,000 rpm with the transmission in NEUTRAL. • **Is the back pressure greater than 27.6 kPa (4 psi)?**	**Yes** GO to A3 . **No** No indications of a restriction have been detected. CONDUCT a diagnosis on other suspect systems. CLEAR the DTCs.
A3 BACK PRESSURE TEST CATALYTIC CONVERTER(S) ON, MUFFLER(S) OFF	
• Turn the engine OFF. • Disconnect the muffler assembly from the catalytic converter. • Repeat the back pressure test. • **Is the back pressure greater than 27 kPa (4 psi)?**	**Yes** The restriction is in the catalytic converter. INSTALL a new catalytic converter. INSPECT the muffler to be sure the catalytic converter debris has not entered the muffler. CLEAR the DTCs. TEST the system for normal operation. **No** The restriction is in the muffler assembly. INSTALL a new muffler. CLEAR the DTCs. TEST the system for normal operation.

Component Tests

Exhaust Heat Shields

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Inspect the exhaust system for loose or missing heat shields or foreign material trapped between the heat shields and the exhaust system components.



3. If any heat shields are loose, install worm gear clamps.
   - Use one of the following clamps: FOTZ-5A231 A or W705949 S300.
   - Trim off the excess ear of the worm clamp.
   - Tighten to 7 Nm (62 lb-in).

4. If the heat shields are missing, install new heat shields or exhaust system components as necessary.

5. If a rattle, noise or buzz condition persists, install a new heat shield.

6. Lower the vehicle.

Exhaust System Alignment

Printable View (7 KB)

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Loosen all fasteners joining the exhaust system components.
3. Beginning at the front of the vehicle, align the exhaust system to establish the maximum clearance. Make sure all fit pipes are pushed all the way into the preceding pipe and the notches are correctly lined up with the tabs.
4. Beginning at the front of the vehicle, tighten all fasteners and clamps to specification. For additional information, refer to Specifications in this section.
5. Start the engine and check the exhaust system for leaks.

Exhaust System Exploded View

ST1447-A	Socket, Exhaust Gas Oxygen Sensor 303-476 (T94P-9472-A)

Material

Item	Specification
High Temperature Nickel Anti-Seize Lubricant XL-2 (in Canada CXG-2-B)	ESE-M12A4-A

Removal and Installation

⚠ WARNING: The normal operating temperature of the exhaust system is very high. Never attempt to repair or install any new part of the system until it has cooled. Be especially careful when working around the 3-way catalytic converter. The temperature of the 3-way catalytic converter rises to a high level after only a few minutes of engine operation.

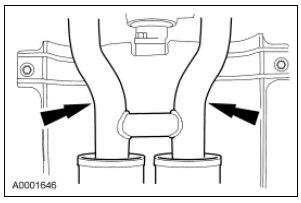
⚠ CAUTION: Do not use oil or grease-based lubricants on the isolators. They may cause deterioration of the rubber.

⚠ CAUTION: Oil or greased-based lubricants on the isolators may cause the exhaust hanger isolator to separate from the exhaust hanger bracket during vehicle operation.

NOTE: Exhaust fasteners are of a torque prevailing design. Use only new fasteners with the same part number as the original. Torque values must be used as specified during reassembly to make sure of correct retention of exhaust components.

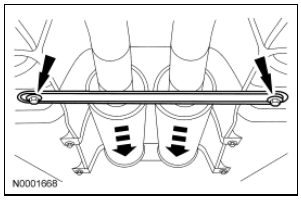
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Using a suitable jackstand, support the exhaust pipes at the rear of the resonators.



A0001646

3. Remove the bolts and the brace.
   - To install, tighten to 25 Nm (18 lb-ft).



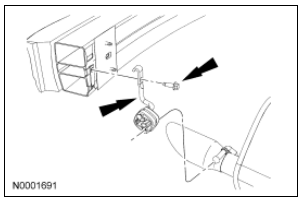
4. ⚠ **CAUTION: Use caution removing the catalytic converter. Make sure not to damage the manifold outlet flare, the converter inlet flare or the studs.**

   Support the catalytic converter near the rear outlet.

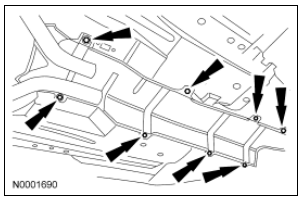
5. **NOTE:** The isolators should not be reused. If the exhaust is removed from the vehicle, install new isolators.

   Remove the exhaust hanger bracket and the exhaust hanger isolator as an assembly.

   - To install, tighten to 30 Nm (22 lb-ft).



6. If necessary, remove the heat shield bolts and nuts and the heat shield.
   - To install, tighten to 10 Nm (89 lb-in).



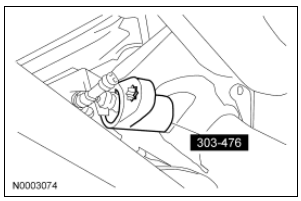
7. Disconnect the heated oxygen sensor electrical connector.

8. Disconnect the catalyst monitor sensor electrical connector.

9. Remove the manifold-to-converter flange stud nuts and the converter assembly.
   - To install, tighten to 40 Nm (30 lb-ft).

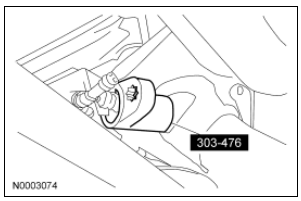
10. If necessary, using the special tool, remove the catalyst monitor sensors.
    - **NOTE:** Apply anti-seize to the sensor threads before installation.

      To install, tighten to 41 Nm (30 lb-ft).



11. If necessary, using the special tool, remove the oxygen sensors.
    - **NOTE:** Apply anti-seize to the sensor threads before installation.

To install, tighten to 41 Nm (30 lb-ft).



12. If necessary, remove the manifold-to-converter flange studs.
    - To install, tighten to 50 Nm (37 lb-ft).

13. To install, reverse the removal procedure.

14. **NOTE:** Clean the mating surfaces of the manifold outlet flare and the catalytic converter inlet flare. Support the catalytic converter near the rear outlet. Make sure not to damage the manifold outlet flare, the converter inlet flare or the studs. To correctly seat the converter, alternately tighten the exhaust manifold-to-catalytic converter nuts to specification.

    Check and, if necessary, align the exhaust system. For additional information, refer to Exhaust System Alignment in this section.

Fuel System

Printable View (7 KB)

The vehicle:

- is equipped with a multiport fuel injection (MFI) system.
- uses separately controlled fuel injectors mounted to the intake manifold for each cylinder.
- has fuel injectors that are supplied with pressurized fuel from the fuel delivery module through the jet pump transfer module, through the fuel injection supply manifold.
- has a fuel injection supply manifold that is controlled by the electronic fuel delivery module which is enabled by the powertrain control module (PCM).
- uses an electronic returnless fuel system.
- has a dual-container (saddle type) fuel tank, each half equipped with a fuel level sensor.
- has a fuel transfer pump in the left fuel tank half to supply fuel to the right, which contains the fuel pump module that supplies fuel under pressure to the fuel injection supply manifold.
- has an inertia fuel shutoff (IFS) switch, located behind the driver side left foot kick panel, which shuts off the fuel in the event of collision.
- has a fuel system filter, located behind the left front wheel well splash shield.

Fuel System

Printable View (7 KB)

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Fuel System Pressure Release

Printable View (10 KB)

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before repairing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

1. Remove the fuel pump relay. For fuel pump relay location, refer to Wiring Diagrams.
2. Start the engine and allow it to idle until it stalls.
3. After the engine stalls, crank the engine for approximately 5 seconds to make sure the fuel injection supply manifold pressure has been released.
4. Turn the ignition switch to the OFF position.
5. When fuel system service is complete, install the fuel pump relay.
6. **NOTE:** It may take more than one key cycle to pressurize the fuel system.

   Cycle the ignition key and wait 3 seconds to pressurize the fuel system. Check for leaks before starting the engine.
7. Start the vehicle and check the fuel system for leaks.

Fuel Tank Draining

Printable View (225 KB)

Special Tool(s)

 ST2134-A	Fuel Drain Hose 310-102
ST1134A	Fuel Storage Tanker 164-R3202 or equivalent
ST2376-A	Fuel Sender Wrench 310-069

⚠ WARNING: Do not smoke or carry lighted tobacco or an open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and can be ignited, resulting in possible personal injury.

⚠ WARNING: Do not carry personal electronic devices such as cell phones, pagers or audio equipment of any type when working on or near any fuel-related components. Highly flammable mixtures are always present and may be ignited. Failure to follow these instructions can result in personal injury.

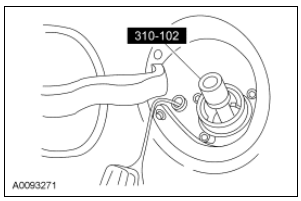
⚠ WARNING: This procedure involves fuel handling. Be prepared for spillage at all times and always observe fuel handling precautions. Failure to follow these instructions can result in personal injury.

1. Release the fuel pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01

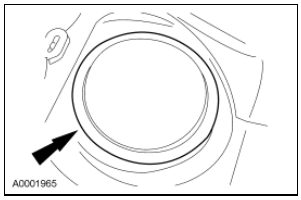
3. **NOTE:** This step will only drain 1/8 of the fuel when tank is full.

   Using the special tool and a suitable fuel recovery system, drain the fuel from the passenger side of the fuel tank.

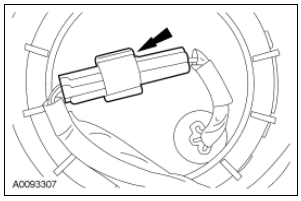


4. Remove the rear seat bottom and any insulation padding covering the fuel module access cover. For additional information, refer to Section 501-10 .

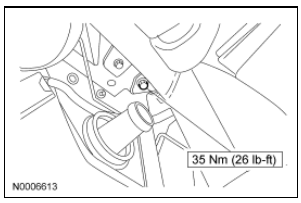
5. Remove the fuel pump module and fuel transfer pump access covers.



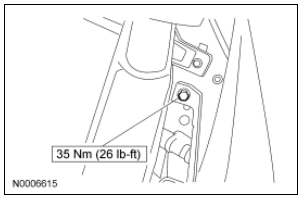
6. Disconnect the electrical connector from the fuel transfer pump module.



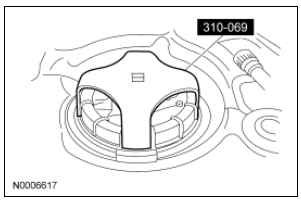
7. Loosen the right fuel tank support strap approximately 1 inch.



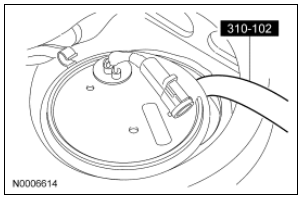
8. Loosen the left fuel tank support strap approximately 1 inch.



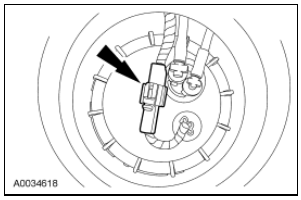
9. Using the special tool, remove the fuel transfer pump lock ring.



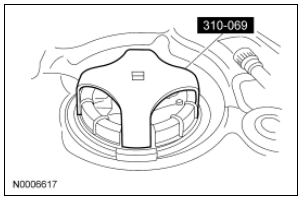
10. Using the special tool and a suitable fuel recovery system, drain the fuel from the passenger side of the fuel tank.



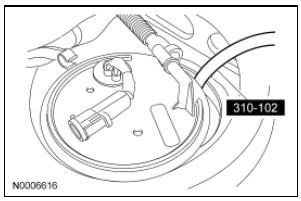
11. Disconnect the electrical connector on the fuel pump module.



12. Using the special tool, remove the fuel pump module lock ring.



13. Using the special tool and a suitable fuel recovery system, drain the fuel from the driver side of the fuel tank.



Quick Connect Coupling

Printable View (78 KB)

Material

Item	Specification
SAE 5W-20 Motorcraft Premium Synthetic Blend Motor Oil XO-5W20-QSP or equivalent	WSS-M2C930-A

Disconnect Type I (Push Button)

⚠ WARNING: Do not carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable vapors are always present and can ignite. Failure to follow these instructions may result in personal injury.

⚠ WARNING: This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ CAUTION: If the liquid or vapor tube is damaged (torn, holes or delaminated), the affected tube assembly must be replaced with a new tube assembly. Do not use aftermarket sleeving. Do not re-adhere loose sleeving material.

⚠ CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

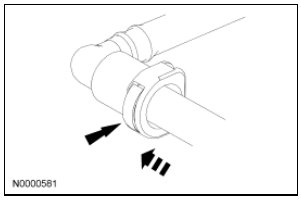
⚠ CAUTION: Fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or tubes.

NOTE: Fuel supply tube connectors are white or are identified by a white band. Fuel return tube connectors are red or are identified by a red band.

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

2. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .

3. Disconnect the fuel tube quick release coupling.
   - Press the fuel tube quick release coupling button and pull the fuel tube to disconnect.



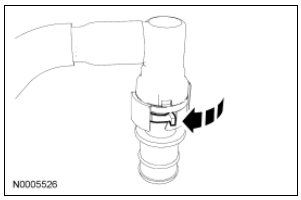
Disconnect Type II (PCV Lock Tab)

⚠ WARNING: Do not carry lighted tobacco or open flame of any type when working on or near any fuel-related components. Highly flammable vapors are always present and can ignite. Failure to follow these instructions may result in personal injury.

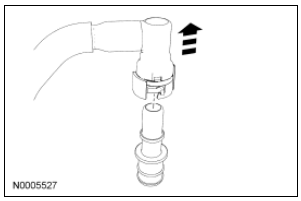
⚠ CAUTION: If the liquid or vapor tube is damaged (torn, holes or delaminated), the affected tube assembly must be replaced with a new tube assembly. Do not use aftermarket sleeving. Do not re-adhere loose sleeving material.

⚠ CAUTION: When reusing liquid or vapor tube connectors, make sure to use compressed air to remove any foreign material from the connector retaining clip area before separating from the tube. Apply clean engine oil to the end of the tube before inserting the tube into the connector.

1. Release the lock tab on the connector.



2. Separate the connector from the fitting.

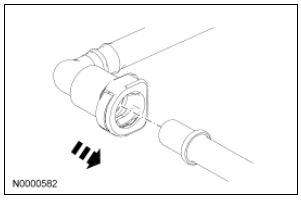


Connect Type I (Push Button)

1. **⚠ CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.**

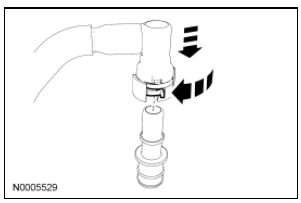
   NOTE: Apply clean engine oil to O-ring seals.

   Install the fuel tube quick release coupling.



Connect Type II (PCV Lock Tab)

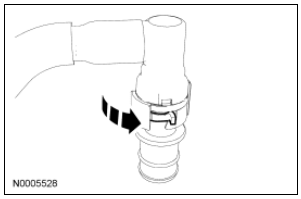
1. Release the lock tab and install the connector onto the fitting.



2. ⚠ **CAUTION: Make sure the fuel tube clicks into place when installing the tube. To make sure that the fuel tube is fully seated, pull on the tube.**

   NOTE: Apply clean engine oil to O-ring seals.

   Apply lock tab into the latched position.



Spring Lock Couplings

Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A

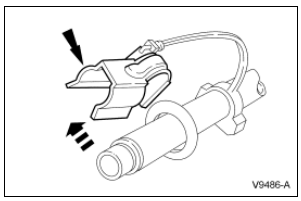
Disconnect and Connect

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

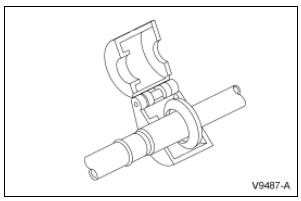
⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before servicing or disconnecting any of the fuel lines or fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

1. Release the fuel system pressure. For additional information, refer to Fuel System Pressure Release in this section.

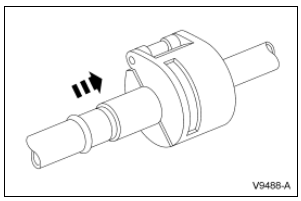
2. Remove the fuel tube clip.



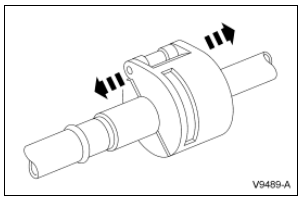
3. Install the disconnect tool.



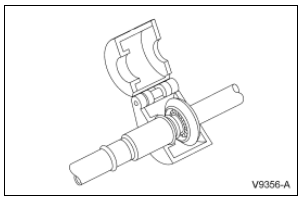
4. Close and push the disconnect tool into the open side of the cage.



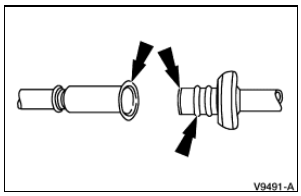
5. Separate the fitting.



6. Remove the disconnect tool.



7. To install, reverse the disconnect procedure.
   - Inspect and clean both the coupling ends.
   - Lubricate the O-ring seals with clean engine oil.

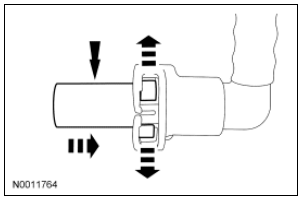


Quick Connect Coupling Retainer Clip

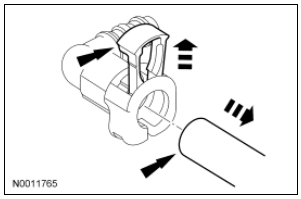
Printable View (50 KB)

Removal

1. Insert the tool that is supplied with the new replacement retainer clip into the quick connect coupling body until it engages and spreads the retainer legs.



2. Grasp the retainer clip under the lip on each side, pull outward and remove while simultaneously removing the tool from the quick connect coupling body.
    - The legs of the retainer clip may catch on the quick connect coupling body just prior to removal and you may need to open the legs of the retainer clip slightly to complete removal.

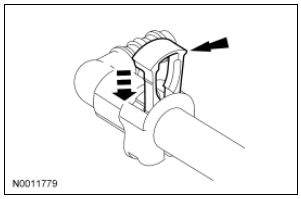


3. Discard the quick connect coupling retainer clip.

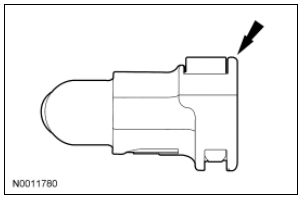
Installation

1. Install the tool into the quick connect coupling body.

2. Insert the legs of the new retainer clip into the windows on the body of the quick connect coupling body.



3. Push the retainer clip straight into the quick connect coupling body until it is flush with the top lip and the side of the connector body.



4. **NOTE:** If the retainer clip is properly installed, the tool should be locked into the quick connect

coupling body and can only be removed when the center of the retaining clip is depressed.

Push down the center of the retainer clip and remove the tool. Upon release the retainer clip should remain in the quick connect coupler body.

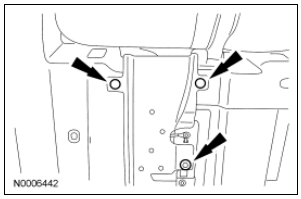
Fuel Tank

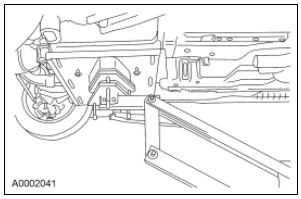
Printable View (65 KB)

Removal and Installation

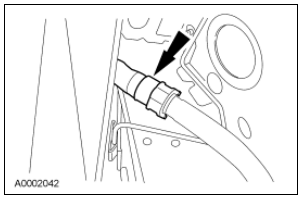
1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Drain the fuel tank. For additional information, refer to Section 310-00 .
3. Remove the driveshaft. For additional information, refer to Section 205-01 .
4. Remove the 2 pin-type retainers and the bolt and position aside the fuel tube shield.
   - To install, tighten to 5 Nm (44 lb-in).



5. Disconnect the fuel supply quick release coupling and the vapor tube fitting. For additional information, refer to Section 310-00 .
6. Disconnect the fuel filler pipe hose from the fuel tank.
7. Position a suitable lifting device to support the fuel tank.



8. Remove the 2 fuel tank strap mounting bolts and position aside the 2 fuel tank straps.
   - To install, tighten to 35 Nm (26 lb-ft).
9. Disconnect the fuel tank electrical connector.
10. Partially lower the fuel tank and disconnect the vapor tube quick release coupling.



11. Remove the fuel tank.
12. To install, reverse the removal procedure.

Fuel Tank Filler Pipe

Printable View (10 KB)

Removal and Installation

⚠ WARNING: Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel-related component. Highly flammable mixtures are always present and may be ignited, resulting in possible personal injury.

⚠ WARNING: Fuel in the fuel system remains under high pressure even when the engine is not running. Before repairing or disconnecting any of the fuel system components, the fuel system pressure must be relieved to prevent accidental spraying of fuel, causing personal injury or a fire hazard.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

2. Remove the fuel filler cap and position aside.

3. Remove the 3 fuel filler pipe mounting screws.

4. Remove the right rear inner fender well splash shield.

5. Remove the fuel filler pipe mounting bolt.
   - To install, tighten to 9 Nm (80 lb-in).

6. **⚠ CAUTION: Some fuel will remain in the filler pipe after draining the fuel tank. Carefully drain the filler pipe into an approved container.**

   Disconnect the fuel tank hose from the fuel filler pipe and remove the pipe.

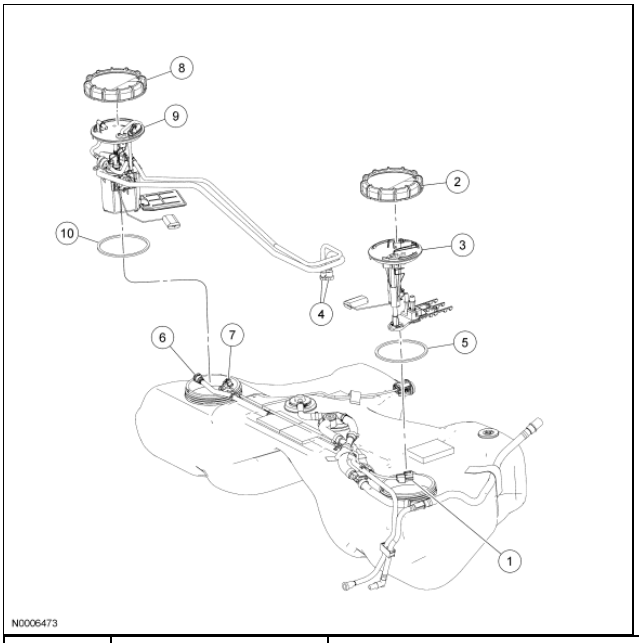
7. To install, reverse the removal procedure.

Fuel Pump Module

Printable View (192 KB)

Special Tool(s)

ST2376-A	Fuel Sender Wrench 310-069



Item	Part Number	Description
1	14A464	Fuel transfer pump electrical connector
2	9A307	Fuel transfer pump lock ring
3	9A307	Fuel transfer pump
4		Fuel crossover hose quick release fittings
5	9276	Fuel transfer pump gasket
6		Fuel pump module tube quick release fitting
7	14A464	Fuel pump module electrical connector
8	9A307	Fuel pump module lock ring
9	9A309	Fuel pump module
10	9276	Fuel pump module gasket

Removal

1. Drain the fuel tank. For additional information, refer to Section 310-00 .

2. **NOTE:** The routing of the internal fuel crossover tubes is critical to correct fuel system operation. Note the routing of the internal fuel crossover hoses at this time.

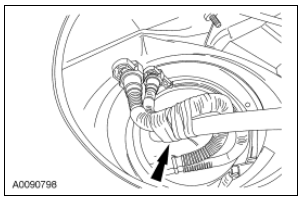
   Partially raise the fuel transfer pump and disconnect the internal fuel crossover tube quick release fittings.

3. Disconnect the fuel pump module tube quick release fitting from the fuel pump module and position aside.

4. ⚠ **CAUTION: Drain the remaining fuel from the delivery module into the fuel tank prior to removal.**

   Before removal, attach a non-conductive material to the crossover tubes. Then remove the fuel pump module and crossover tubes as an assembly, using the non-conductive material to pull the crossover lines through the gas tank.

   - Remove and discard the fuel pump module gasket.

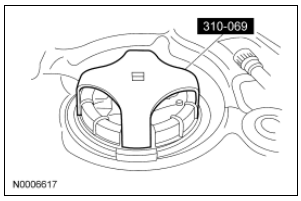


Installation

1. **NOTE:** Install the fuel pump module and crossover tubes as an assembly.

   Attaching the non-conductive material to the crossover tubes, pull the crossover tubes through the gas tank to install the fuel pump module.

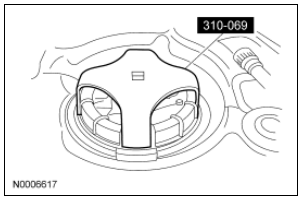
2. Using the special tool, install the fuel pump module and lock ring.
   - Install a new fuel pump module gasket.
   - Tighten to 80 Nm (59 lb-ft).



3. **NOTE:** Make sure that the fuel crossover tubes are routed correctly.

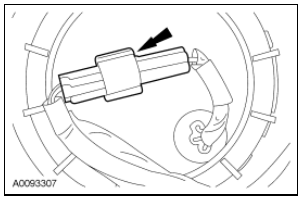
   Partially raise the fuel transfer pump and connect the internal fuel crossover hose quick disconnect fittings.

4. Using the special tool, install the fuel transfer pump and lock ring.
   - Install a new fuel transfer pump gasket.
   - Tighten to 80 Nm (59 lb-ft).

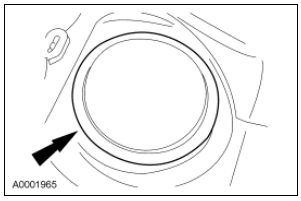


5. Connect the fuel pump module tube quick release fitting at the fuel pump module.

6. Connect the fuel pump module and fuel transfer pump electrical connectors.



7. Install the fuel pump module and fuel transfer pump access covers.



8. Install the rear seat bottom and any insulation padding covering the access covers. For additional information, refer to Section 501-10 .

9. Tighten the 2 fuel tank support strap bolts.
   - Tighten to 35 Nm (26 lb-ft).

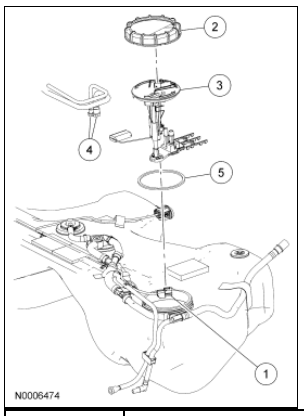
10. Connect the battery ground cable. For additional information, refer to Section 414-01 .

Fuel Transfer Pump

Printable View (121 KB)

Special Tool(s)

ST2376-A	Fuel Sender Wrench 310-069



Item	Part Number	Description
1	14A464	Fuel transfer pump electrical connector
2	9A307	Fuel transfer pump lock ring
3	9A0309	Fuel transfer pump
4		Fuel crossover hose quick release fittings
5	9276	Fuel transfer pump gasket

Removal

1. Drain the fuel tank. For additional information, refer to Section 310-00 .

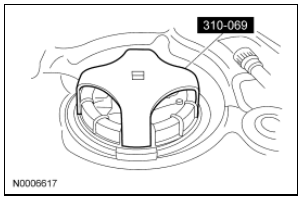
2. Partially raise the fuel transfer pump and disconnect the internal fuel crossover tube quick release fittings and remove the fuel transfer pump.
   - Remove and discard the fuel transfer pump gasket.

Installation

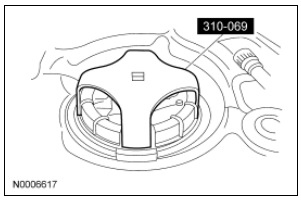
1. **NOTE:** Make sure that the fuel crossover tubes are routed correctly.

   Partially raise the fuel transfer pump and connect the internal fuel crossover tube quick disconnect fittings.

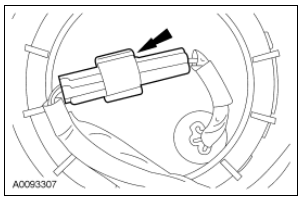
2. Using the special tool, install the fuel transfer pump and lock ring.
   - Install a new fuel transfer pump gasket.
   - Tighten to 80 Nm (59 lb-ft).



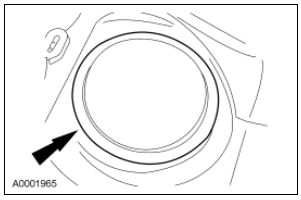
3. Using the special tool, install the fuel pump module and lock ring.
    - Install a new fuel pump module gasket.
    - Tighten to 80 Nm (59 lb-ft).



4. Connect the fuel pump module and fuel transfer pump electrical connectors.



5. Install the fuel pump module and fuel transfer pump access covers.



6. Install the rear seat bottom and any insulation padding covering the access covers. For additional information, refer to Section 501-10 .

7. Tighten the 2 fuel tank support strap bolts.
    - Tighten to 35 Nm (26 lb-ft).

8. Connect the battery ground cable. For additional information, refer to Section 414-01 .

20		Fuel tube assembly

1. For additional information, refer to the procedures in this section.

Fuel Lines

Printable View (87 KB)

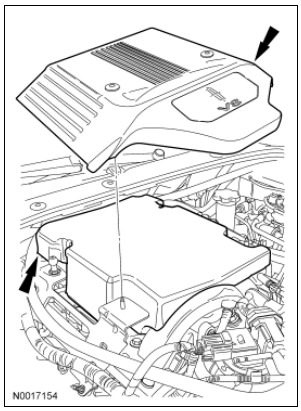
Material

Item	Specification
SAE 5W-20 Premium Synthetic Blend Motor Oil XO-5W20-QSP	WSS-M2C930-A

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Release the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Remove the left front wheel well rear splash shield.
5. **CAUTION: The engine appearance cover is equipped with a noise suppressor. If the noise suppressor becomes separated from the engine appearance cover it must be positioned on the intake manifold prior to installing the engine appearance cover.**

   Remove the engine appearance cover and the noise suppressor (if detached).



6. Disconnect the fuel hose safety clip and spring lock coupling. For additional information, refer to Section 310-00 .
7. Disconnect the 2 vapor tube quick release fittings from the evaporative canister purge valve. For additional information, refer to Section 310-00 .
8. Remove the fuel tube mounting bolt.
   - To install, tighten to 8 Nm (71 lb-in).
9. Disconnect the vapor tube quick release fitting from the fuel tube. For additional information, refer to Section 310-00 .

10. Disconnect the fuel tube quick release fittings from both sides of the fuel filter. For additional information, refer to Section 310-00 .

11. Remove the fuel filter bracket mounting bolt, fuel filter bracket and the fuel filter.
    - To install, tighten to 7 Nm (62 lb-in).

12. Remove the fuel tube shield mounting bolt.
    - To install, tighten to 5 Nm (44 lb-in).

13. Remove the 3 fuel tube shield mounting fasteners and the fuel tube shield.
    - To install, tighten to 5 Nm (44 lb-in).

14. Disconnect the fuel tube quick release fitting from the fuel tank supply tube. For additional information, refer to Section 310-00 .

15. Disconnect the vapor tube quick release fitting from the fuel vapor control tube assembly valve. For additional information, refer to Section 310-00 .

16. Remove the 4 fuel tube mounting bolts and the fuel tube assembly.
    - To install, tighten to 7 Nm (62 lb-in).

17. To install, reverse the removal procedure.

Fuel Filter

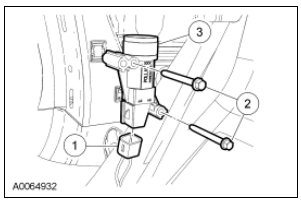
Printable View (8 KB)

Removal and Installation

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Relieve the fuel system pressure. For additional information, refer to Section 310-00 .
3. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
4. Remove the left front wheel well rear splash shield.
5. Disconnect the fuel tube quick release fittings from both sides of the fuel filter. For additional information, refer to Section 310-00 .
6. Remove the fuel filter bracket mounting bolt, fuel filter bracket, and the fuel filter.
    - To install, tighten to 7 Nm (62 lb-in).
7. To install, reverse the removal procedure.

Inertia Fuel Shutoff (IFS) Switch

Printable View (30 KB)



Item	Part Number	Description
1	14A464	Inertia fuel shutoff switch (IFS) electrical connector
2	W504148	IFS mounting bolts
3	9341	Inertia fuel shutoff switch

Removal and Installation

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Remove the left-hand lower A-pillar trim panel.
3. Disconnect the inertia fuel shutoff switch electrical connector.
4. Remove the 2 bolts and the inertia fuel shutoff switch.
5. To install, reverse the removal procedure.

Printable View (7 KB)

Torque Specifications

Description	Nm	lb-in
Accelerator pedal mounting nuts	9	80

Acceleration Control

Printable View (7 KB)

The acceleration control consists of:

- accelerator pedal and sensor assembly.

The engine management system electronically operates the throttle of the engine in response to throttle pedal movements initiated by the driver. In the event of a system failure, the engine management system provides a "limp home" mode which allows the car to be driven with limited performance.

Acceleration Control

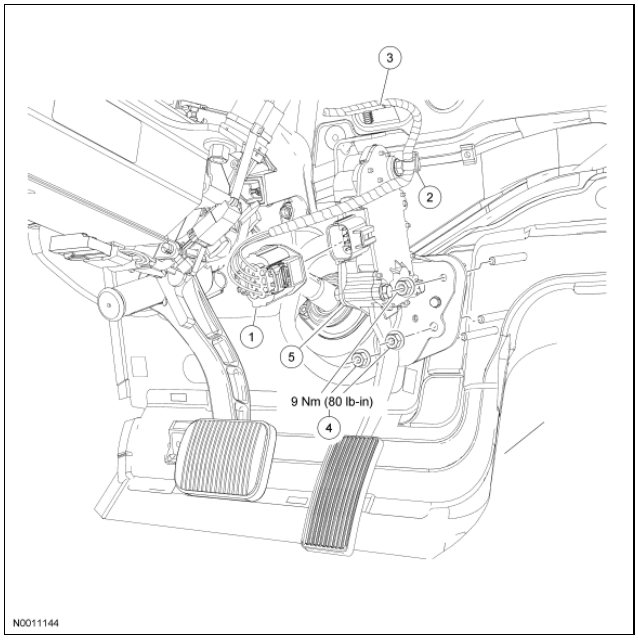
Printable View (7 KB)

Refer to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Accelerator Pedal

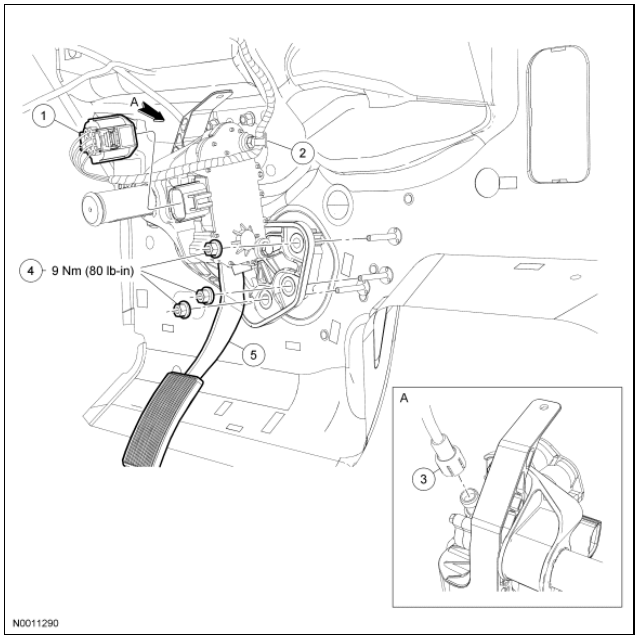
Printable View (327 KB)

Fixed Pedal



Item	Part Number	Description
1	14A464	Accelerator pedal electrical connector
2	7047-3144-30	Accelerator pedal wiring harness retainer
3	13A506	Accelerator pedal pin-type wiring harness retainer
4	N806385	Accelerator pedal mounting nuts (3 required)
5	9F836	Fixed accelerator pedal

Adjustable Pedal



Item	Part Number	Description
1	14A464	Accelerator pedal electrical connector
2	7047-3144-30	Accelerator pedal wiring harness retainer
3	13A506	Accelerator pedal drive motor cable retainer clip
4	N806385	Accelerator pedal mounting nuts
5	9F836	Adjustable accelerator pedal

Removal and Installation

All pedals

1. Disconnect the battery ground cable. For additional information, refer to Section 414-01 .
2. Disconnect the accelerator pedal electrical connector.
3. Remove the accelerator pedal wiring harness retainer from the accelerator pedal bracket bolt.

Fixed pedal

4. Remove the accelerator pedal wiring harness pin-type retainer from the accelerator pedal bracket.

Adjustable pedal

5. Disconnect the accelerator drive cable from the accelerator pedal.

All pedals

6. Remove the 3 accelerator pedal retaining nuts.
   - To install, tighten to 9 Nm (80 lb-in).
7. Remove the accelerator pedal.
8. To install, reverse the removal procedure.

Adjustable pedal

9. Index the pedals. For additional information, refer to Section 206-06 .

Printable View (7 KB)

Torque Specifications

Description	Nm	lb-ft	lb-in
Speed Control Switch Screws	7		62

Speed Control

Printable View (7 KB)

The speed control system is controlled by the powertrain control module (PCM). The speed control system is designed to maintain a selected vehicle speed between 48 and 200 km/h (30 and 124 mph).

The speed control system is controlled by the steering wheel-mounted switches (ON, OFF, SET+, SET-, RESUME, and CANCEL), and the brake pedal. The steering wheel-mounted switches are backlit.

The speed control functions include:

- turn on the speed control system
- set and maintain the desired vehicle speed
- accelerate the vehicle speed
- tap-up/tap-down the vehicle speed
- resume the prior vehicle speed
- turn off the vehicle speed control system
- cancel the speed control

Speed Control

Printable View (97 KB)

Refer to Wiring Diagrams Cell 31 , Speed Control for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM), or equivalent diagnostic tool with appropriate adapter cable

Principles of Operation

Pressing and releasing the ON switch turns the system on. Pressing and releasing the SET+ or SET- switch while the vehicle is traveling at the desired speed activates the system. The vehicle maintains the desired speed.

Tapping the SET+ or SET- buttons, while in the set mode respectively, increases or decreases the maintained vehicle speed by 2 km/h (1 mph) per tap. If the respective button is pressed and held, the vehicle speed continues to accelerate or decelerate until the button is released.

Pressing and releasing the OFF switch, or positioning the ignition switch in the OFF position, turns the speed control off. Pressing the brake pedal or pressing the CANCEL button puts the system in the STANDBY mode. Pressing the RESUME button, when the system is in STANDBY mode causes the vehicle to accelerate until the last set speed is resumed. Resume does not function if the OFF button is pressed, the ignition switch is in the OFF position, or if the current vehicle speed is below the minimum operational speed.

Whenever the speed control system is engaged and active, a speed control illuminator is set.

The inputs to the PCM for the speed control system are the:

- output shaft sensor (OSS)
- digital transmission range (TR) sensor
- speed control deactivator switch
- stoplamp switch
- speed control switches

The outputs from the PCM for the speed control system are the:

- instrument cluster
- throttle command

The speed control system does not require an electronic actuator for electronic throttle control (ETC) vehicles. Throttle position is completely controlled by the PCM through the electronic throttle body. Speed control

electronics are contained entirely within the ETC subsystem.

When the speed control is active, the electronic actuator corrects for deviations in the actual vehicle speed by proportionally moving the throttle plate. The control electronics modulate the throttle to minimize error between actual vehicle speed and the desired speed.

The PCM strategy uses the engine control for smooth accelerations. In instances where the vehicle tends to exceed set speed, the PCM invokes an engine braking strategy to help maintain the desired vehicle speed.

The PCM sends a requested CAN vehicle speed control set speed message (enable/disable) whenever the speed control set indicator should be turned ON or OFF.

The driver commands the speed control system by pressing steering-wheel mounted switches. The steering wheel switches are hardwired to the PCM.

The speed control system operates in the following modes:

- STANDBY
- OFF
- VS CONTROL
- TAP UP
- TAP DOWN
- ACCEL
- DECEL
- RESUME

When the speed control is in the ON mode, and the PCM receives a SET+ or SET- switch input, the speed control system enters into the SET mode and maintains present vehicle speed (provided the vehicle speed is within the system operating range). When the PCM receives a SET+ switch input, the speed control system will accelerate the vehicle at approximately 1.5 mph/sec (on level roads). The speed control system continues to accelerate the vehicle until the switch is no longer pressed and then will maintain that vehicle speed. If the duration of the switch input is less than 640ms the speed control system will increase vehicle speed by 2 km/h (1 mph). When the system is in the standby mode, and a RESUME switch input is received, the speed control subsystem transitions into SET mode and modifies vehicle speed to resume the last SET vehicle speed, provided the speed control system has previously been in the SET mode subsequent to the key on last cycle.

When the PCM receives a SET- switch input, the speed control system will decrease vehicle speed at approximately 1.5 mph/sec (on level roads). Once the switch is no longer pressed, the speed control system ceases vehicle deceleration and maintains present vehicle speed. If the duration of the switch input is less than 640ms, the speed control system will decrease vehicle speed by 2 km/h (1 mph).

In the event of an OFF command or a deactivation request from any source, except the cancel switch, the system will carry out a hard deactivation and immediately return the throttle to the idle position.

In the event of CANCEL switch input, the system will deactivate and return the throttle to the idle position at a smooth and controlled rate.

NOTE: The speedometer does not use the same signal as the speed control system.

The speed control system provides self-diagnostics. Speed control is disabled anytime an error is detected in the system. No cluster telltale or message center messages are displayed when faults occur. Fault codes will be logged by the PCM.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Speed control switch • Electronic throttle body • Stoplamp switch • Speed control deactivator switch	• Central junction box (CJB) fuse 35 (5A) (stoplamp switch) • Underhood auxiliary junction box (AJB) fuse 6 (15A) (speed control deactivator switch) • Circuitry • Powertrain control module (PCM)

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. Verify the speedometer operates correctly without speed control by test driving the vehicle. If the speedometer does not operate correctly, refer to Section 413-01 .

5. Verify the stoplamps operate correctly with the ignition switch in the OFF position. If the stoplamps do not operate correctly, refer to Section 417-01 .

6. Verify the brake warning indicator operates correctly. If the brake warning indicator does not operate correctly, refer to Section 413-01 .

7. If the cause is not visually evident, connect the diagnostic tool to the data link connector (DLC) and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
    - verify that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

8. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool operating manual.

9. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - SCP, CAN, ISO, or UBP circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for PCM, refer to Section 418-00 .
    - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out the self-test diagnostics for the PCM.

10. If the DTCs retrieved are related to the concern, go to the Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Index.

11. If no DTCs related to the concern are retrieved, GO to Symptom Chart .

NOTE: DTC P0703 and DTC P1572 must be repaired before any other DTC.

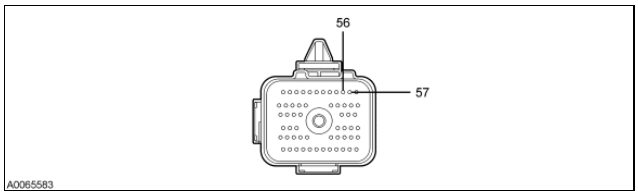
Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Index

DTCs	Description	Source	Action
P0500	Vehicle Speed Error	PCM	REFER to Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P0579	Cruise Control Multifunction Input A Circuit Range/Performance	PCM	Go To Pinpoint Test A .
P0581	Cruise Control Multifunction Circuit High	PCM	Go To Pinpoint Test A .
P0703	Brake On/Off Failure	PCM	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1572	Brake On/Off Failure	PCM	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.

Symptom Chart

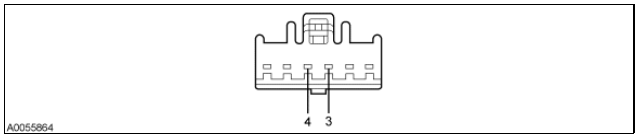
Symptom Chart
Connector Circuit Reference

PCM C175b



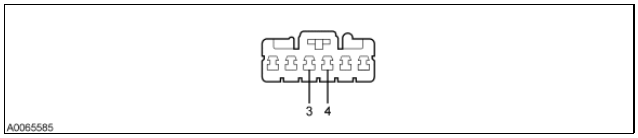
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
56	31S-PG24 (BK/OG) PCM return signal from the clockspring	0 volts, less than 5 ohms between the PCM and the clockspring. Greater than 10,000 ohms between the PCM and ground.
57	7-PG24 (YE/BU) PCM voltage signal to the clockspring	0 volts, less than 5 ohms between the PCM and the clockspring. Greater than 10,000 ohms between the PCM and ground.

Clockspring C218b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	31S-PG1 (BK/BU) speed control switch circuit	0 volts, less than 5 ohms between the clockspring and the PCM. Greater than 10,000 ohms between the clockspring and ground with the PCM disconnected.
4	7-PG24 (YE/BU) speed control switch voltage reference circuit	Approximately 4.5 volts, less than 5 ohms between the clockspring and the PCM. Greater than 10,000 ohms between clockspring and ground.

Upper Clockspring Connector



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3		0 volts, less than 5 ohms between the upper clockspring connector and the speed control switch. Greater than 10,000 ohms between the upper clockspring connector and ground.
4		0 volts, less than 5 ohms between the upper clockspring connector and the speed control switch. Greater than 10,000 ohms between the upper clockspring connector and ground.

Pinpoint Test A: The Speed Control Is Inoperative

Normal Operation

The powertrain control module (PCM) sends a signal through circuit 7-PG24 (YE/BU) to the speed control switch which passes through the clockspring. The return signal is sent through circuit 31S-PG1 (BK/BU) and the clockspring.

Possible Causes

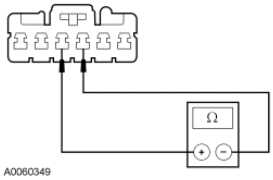
- circuit 7-PG24 (YE/BU) open, short to voltage, or short to ground
- circuit 31S-PG1 (BK/BU) open, short to voltage, or short to ground
- circuit 31S-PG24 (BK/OG) open, short to voltage, or short to ground
- clockspring
- PCM
- speed control switch

PINPOINT TEST A: SPEED CONTROL IS INOPERATIVE

Test Step	Result / Action to Take
A1 CHECK CIRCUITS 7-PG24 (YE/BU), 31S-PG1 (BK/BU), AND 31S-PG24 (BK/OG) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Powertrain Control Module (PCM) C175b. • Disconnect: Clockspring C218b. • Key in ON position. • Measure the voltage between the PCM C175b-56, circuit 31S-PG24 (BK/OG), harness side and ground; and between the PCM C175b-57, circuit 7-PG24 (YE/BU), harness side and ground.  • **Is any voltage present?**	**Yes** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to A2 .
A2 CHECK CIRCUITS 7-PG24 (YE/BU), 31S-PG1 (BK/BU), AND 31S-PG24 (BK/OG) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the PCM C175b-56, circuit 31S-PG24 (BK/OG), harness side and ground; and between the PCM C175b-57, circuit 7-PG24 (YE/BU), harness side and ground.  • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to A3 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test
A3 CHECK CIRCUITS 7-PG24 (YE/BU), 31S-PG1 (BK/BU) AND 31S-PG24 (BK/OG) FOR AN OPEN	
• Measure the resistance between the PCM C175b-56, circuit 31S-PG24 (BK/OG), harness side and the clockspring C218b-3, circuit 31S-PG1 (BK/BU), harness side; and between the PCM C175b-57, circuit 7-PG24 (YE/BU), harness side and the clockspring C218b-4, circuit 7-PG24 (YE/BU), harness side.	**Yes** GO to A4 . **No** REPAIR the circuit(s) in question. CLEAR the DTCs. REPEAT the self-test.

 A0060347 • **Are the resistances less than 5 ohms?**	
A4 CHECK THE CLOCKSPRING	
• Remove the driver air bag module. Refer to Section 501-20B . • Disconnect: Upper Clockspring Connector. • Measure the resistance between the clockspring C218b pin 3, component side and the upper clockspring connector pin 3, component side; and between the clockspring C218b pin 4, component side and the upper clockspring connector pin 4, component side.  A0060348 • **Are the resistances less than 5 ohms?**	**Yes** GO to A5 . **No** INSTALL a new clockspring. REFER to Section 501-20B . INSTALL the driver air bag module. Refer to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
A5 CHECK THE STEERING WHEEL CONTROL HARNESS	
• Disconnect: Speed Control Switch. • Inspect the steering wheel control harness for shorts, opens, or any damage. • **Is the steering wheel control harness OK?**	**Yes** GO to A6 . **No** REPAIR or INSTALL a new steering wheel control harness. INSTALL the driver air bag module. Refer to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.
A6 CHECK THE SPEED CONTROL SWITCH	
• Connect: Speed Control Switch. • Measure the resistance between the upper clockspring connector pin 3, harness side and the upper clockspring connector pin 4, harness side while pressing the speed control buttons as follows: Speed Control Switch **Speed Control Switch** / **Resistance Value** Cancel / 114 - 126 ohms SET- / Between 285 and 315 ohms	**Yes** INSTALL the driver air bag module. Refer to Section 501-20B . GO to A7 . **No** INSTALL a new speed control switch. REFER to Speed Control Switch in this section. INSTALL the driver air bag module. Refer to Section 501-20B . CLEAR the DTCs. REPEAT the self-test.

SET+	570 - 630 ohms
Resume	1,055 - 1,165 ohms
On	2,004 - 2,216 ohms
Off	Less than 5 ohms



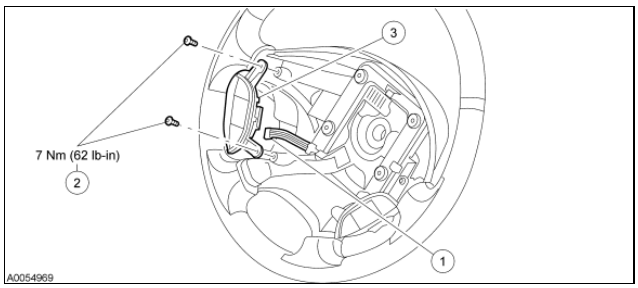
- **Are the speed control switch resistance values OK?**

A7 CHECK FOR CORRECT PCM OPERATION	

• Disconnect all the PCM connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the PCM connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new PCM. REFER to Section 303-14 . TEST the system for normal operation.
	
	No
	The system is operating correctly at this time. Concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Speed Control Switch

Printable View (57 KB)



Item	Part Number	Description
1	14A005	Speed control switch electrical connector
2	W705342-S424	Speed control switch screws (2 required)
3	9C888	Speed control switch

Removal and Installation

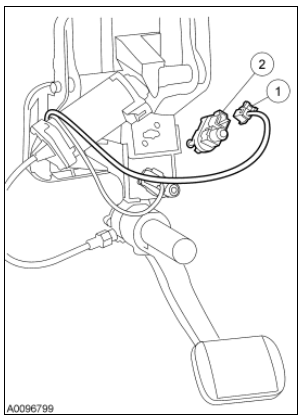
1. Remove the driver air bag module. For additional information, refer to Section 501-20B .

2. Remove the 2 screws and the speed control switch.
   - Disconnect the speed control switch electrical connector.
   - To install, tighten to 7 Nm (62 lb-in).

3. To install, reverse the removal procedure.

Speed Control Deactivator Switch

Printable View (47 KB)



Item	Part Number	Description
1	14A005	Speed control deactivator switch electrical connector
2	9F924	Speed control deactivator switch

Removal

1. Disconnect the speed control deactivator switch electrical connector.
2. Rotate the speed control deactivator switch counterclockwise 45 degrees and remove it from the bracket.

Installation

1. While applying the brake pedal, install the speed control deactivator switch in the bracket and rotate it 45 degrees clockwise.
2. Connect the electrical connector.

Principles of Operation

Variable Assist Power Steering (VAPS)

The VAPS system controls the level of power assistance available to the driver based on vehicle speed. At less than 3.2 km/h (2 mph), full power steering assist is provided to decrease steering efforts and increase maneuverability. Between 3.2 km/h (2 mph) and 191 km/h (119 mph), steering assist decreases gradually at a calibrated rate to raise steering efforts for increased directional stability and greater road feel. At greater than 191 km/h (119 mph), steering assist is constant.

The front electronic module (FEM) outputs a pulse-width-modulated (PWM) current to the control valve actuator. The control valve actuator controls the hydraulic valve that determines the amount of hydraulic assist

provided to the steering gear. The amount of assistance provided varies with the control valve actuator current, which is based on vehicle speed according to a look-up table internal to the FEM. The FEM pulse-width modulates the control valve actuator current to provide the desired amount of assistance. The amount of hydraulic steering assistance provided by the VAPS subsystem is proportional to the average control valve current.

The vehicle speed is provided to the FEM through the standard corporate protocol (SCP) network from the anti-lock brake system (ABS).

The engine rpm is provided to the FEM through the SCP network from the powertrain control module (PCM). The FEM uses the engine rpm to determine if the engine is running. The FEM only outputs control valve actuator current when the engine is running to minimize noise, vibration, or harshness when the engine is off. The FEM assumes the engine is running only if the engine rpm is greater than 100 rpm.

Upon starting the engine, the FEM provides a 200 millisecond full-on pulse followed by a 150 millisecond full-off pulse to the control valve actuator. Normal VAPS system operation begins after this cleaning stroke is complete. In the event the rpm signal is invalid from the PCM (less than 100 rpm) and the vehicle speed is less than 1.6 km/h (1 mph), the VAPS system does not carry out the cleaning stroke or apply current to the control valve actuator. When the engine speed exceeds 100 rpm, the system carries out the cleaning stroke and begins applying the calibrated current to the actuator.

Inspection and Verification

1. Verify the customer concern.

2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Fluid level • Tire pressure • Tires • Drive belt • Drive belt tensioner • Steering column alignment • Tie rod ends • Suspension components • Steering column shaft U-joints • Intermediate shaft bolts • Power steering reservoir baffle • Power steering reservoir filter • Power steering pressure lines, fittings, or O-rings • Power steering return hoses and clamps • Steering gear • Power steering pump	• Rear battery junction box (BJB) relay 32 • BJB fuse 30 (10A) • Front electronic module (FEM) • Wiring • Connectors

3. **NOTE:** The 2 areas that should be inspected for possible contamination are the power steering reservoir filter, and the check valve in the inlet port on the power steering gear (if equipped).

   Inspect the power steering fluid for the following conditions:

   - Aerated or foamy: Purge the power steering system. Refer to Power Steering System Purging in this section.
   - Overheating or contamination: Flush the power steering system. Refer to Power Steering System Flushing in this section.

4. Check the power steering system for fluid leaks.
   - Check the power steering fluid level.

     NOTE: It may be necessary to add power steering fluid to achieve the correct level.

     With the ignition ON:
   - Wipe off the power steering pump, power steering pressure hose, power steering return hose, power steering fluid cooler, hose assembly, and steering gear.
   - ⚠ **CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump can occur.**

     Start the engine and turn the steering wheel from stop-to-stop several times and check for leaks.
   - If a fluid leak from the steering line-to-steering gear clamp plate is evident, refer to Section 211-02 .

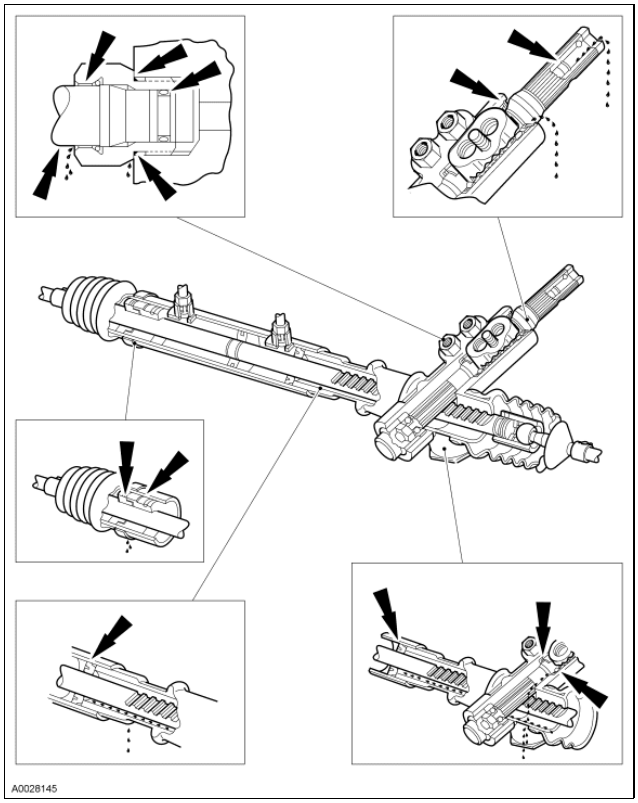
5. Inspect the power steering pressure and return hoses, fittings and O-rings for leaks.

- If a leak is detected at a fitting or clamp plate, tighten to specification. If the leak is still evident, visually inspect the fittings, clamp plate, O-rings, and Teflon® seals. Install new as necessary. Refer to Section 211-02 .
- If a leak is detected at a constant tension spring clamp, verify that the hose is fully installed on the fitting and that the hose clamp is correctly positioned. If the leak remains, install a new constant tension spring clamp.
- If a leak is detected at a screw clamp joint, tighten the screw clamp. If the leak remains, inspect the tube end and install a new hose. Refer to Section 211-02 .
- If a leak is detected at the power steering reservoir, install a new reservoir. Refer to Section 211-02 .
- If a leak is detected at a power steering pressure or return hose, install a new hose. Refer to Section 211-02 .
- If a leak is detected between a fitting nut, replace the fitting nut.
- If a leak is detected at the power steering pump, install a new power steering pump. Refer to Section 211-02 .

NOTE: To inspect for leaks it may be necessary to remove the squeeze-type clamp from the steering gear boots.

6. Inspect the power steering gear for leaks. If a leak is detected at the power steering gear, install a new power steering gear. Refer to Section 211-02 .

External Leak Check Potential Power Rack-and-Pinion Steering Gear Leak Points



7. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.

8. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel, and select the vehicle to be tested from the diagnostic tool menu. If the diagnostic tool does not communicate with the vehicle:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.

9. If the diagnostic tool still does not communicate with the vehicle, refer to the diagnostic tool manual.

10. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - SCP, CAN or ISO; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for FEM, refer to Section 419-10 .
    - System passed, retrieve and record the continuous diagnostic trouble codes (DTCs), erase the continuous DTCs, and carry out the self-test diagnostics for the FEM.

11. If the DTCs retrieved are related to the concern, go to the Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index to continue diagnosis.

12. If no DTCs related to the concern are retrieved, proceed to next step to continue diagnosis.

13. If an obvious cause for an observed or reported concern is found, correct the cause before proceeding to the next step.

14. If the cause is not visually evident, verify the symptom and GO to Symptom Chart .

Front Electronic Module (FEM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Source	Action
B1342	ECU is Defective	FEM	CLEAR the DTC. RETRIEVE the DTCs. If DTC B1342 is retrieved, INSTALL a new FEM. REFER to Section 419-10 . REPEAT the self-test.
C1924	VAPS Solenoid Actuator Output Short to Ground	FEM	Go To Pinpoint Test A .
C1925	VAPS Solenoid Actuator Return Circuit Failure	FEM	Go To Pinpoint Test B .

Steering System Symptom Definitions

Drift/Pull

Pull is described as a tugging sensation, felt by the hands on the steering wheel, that must be overcome to keep the vehicle going straight.

Drift describes what a vehicle with this condition does with the hands off the steering wheel.

- A vehicle-related drift/pull, on a flat road, can cause a consistent deviation from the straight-ahead path and require constant steering input in the opposite direction to counteract the effect.
- Drift/pull can be induced by conditions external to the vehicle such as wind or road camber.

Excessive Steering Wheel Play

Excessive steering wheel play is a condition in which there is too much steering wheel movement before the wheels move. A small amount of steering wheel free play is considered normal.

Feedback

Feedback is a roughness felt in the steering wheel when the vehicle is driven over rough pavement.

Hard Steering or Lack of Assist

Hard steering or lack of assist is experienced when the steering wheel effort exceeds specifications. Hard steering can remain constant through the full turn or occur near the end of a turn. It is important to know the difference between hard steering/lack of assist and binding.

Hard steering or lack of assist can result from hydraulic, electrical, or mechanical conditions. It is extremely important to know if this concern occurs during driving or during high-effort parking maneuvers.

Nibble

Sometimes confused with shimmy, nibble is a condition resulting from tire interaction with various road surfaces and felt by the driver as small rotational oscillations of the steering wheel.

Poor Returnability/Sticky Steering

Poor returnability and sticky steering is used to describe the poor return of the steering wheel to center after a turn, or the steering correction, is completed.

Shimmy

Shimmy, as felt by the driver, is large, consistent, rotational oscillations of the steering wheel resulting from large, side-to-side (lateral) tire/wheel movements.

Shimmy is usually experienced near 64 km/h (40 mph), and can begin or be amplified when the tire contacts pot holes or irregularities in the road surface.

Wander

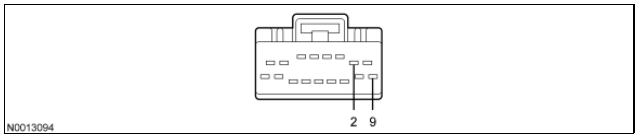
Wander is the tendency of the vehicle to require frequent, random left and right steering wheel corrections to maintain a straight path down a level road.

Symptom Chart

Symptom Chart

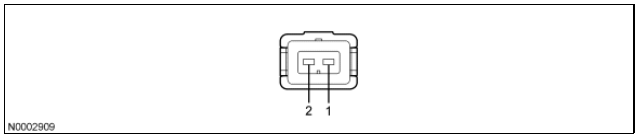
Connector Circuit Reference

Front Electronic Module (FEM) C201a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	9-CE9 (BN/GN) variable assist power steering (VAPS) solenoid feedback signal to the FEM module	Voltage varies with the VAPS solenoid position.
9	8-CE9 (WH/GN) VAPS solenoid input signal	Voltage varies from 1 to 12 volts with the FEM module output.

VAPS Solenoid C120



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	8-CE9 (WH/GN) VAPS solenoid input signal	Voltage varies from 1 to 12 volts with the FEM module output.
1	9-CE9 (BN/GN) VAPS solenoid feedback signal to the FEM module	Voltage varies with the VAPS solenoid position.

Pinpoint Test A: DTC C1924 VAPS Solenoid Actuator Output Short To Ground

Normal Operation

The front electronic module (FEM) sends the variable assist power steering (VAPS) solenoid a pulse width modulated (PWM) current through circuit 8-CE9 (WH/GN). The VAPS solenoid sends a feedback voltage to the FEM module, depending on the power steering assist demand, through circuit 9-CE9 (BN/GN).

Possible Causes

- VAPS solenoid
- circuit 8-CE9 (WH/GN)

PINPOINT TEST A: DTC C1924 VARIABLE ASSIST POWER STEERING (VAPS) SOLENOID ACTUATOR OUTPUT SHORT TO GROUND

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
A1 ISOLATE THE VAPS SOLENOID	
• With the vehicle in NEUTRAL, position it on a hoist. Refer to Section 100-02 . • Disconnect: VAPS Solenoid C120. • Measure the resistance across the VAPS solenoid C120, terminals 1 and 2, component side.  • **Is the resistance approximately 6 to 8 ohms?**	**Yes** GO to A2 . **No** INSTALL a new VAPS solenoid. REFER to Section 211-02 . CLEAR the DTC. REPEAT the self-test.
A2 CHECK CIRCUIT 8-CE9 (WH/GN) FOR A SHORT TO GROUND	
• Measure the resistance between VAPS solenoid C120-1, circuit 8-CE9 (WH/GN), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A3 . **No** REPAIR circuit 8-CE9 (WH/GN). CLEAR the DTC. REPEAT the self-test.

A3 CHECK CIRCUIT 8-CE9 (WH/GN) AND THE VAPS SOLENOID FOR A SHORT TO GROUND	
• Measure the resistance between VAPS solenoid C120 terminal 1, component side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** CARRY OUT the FEM diagnosis. REFER to Section 419-10 . CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new VAPS solenoid. REFER to Section 211-02 . CLEAR the DTC. REPEAT the self-test.

Pinpoint Test B: DTC C1925 VAPS Solenoid Actuator Return Circuit Failure

Normal Operation

The front electronic module (FEM) sends the variable assist power steering (VAPS) solenoid a pulse width modulated (PWM) current through circuit 8-CE9 (WH/GN). The VAPS solenoid sends a feedback voltage to the FEM module, depending on the power steering assist demand, through circuit 9-CE9 (BN/GN).

Possible Causes

- VAPS solenoid
- circuit 8-CE9 (WH/GN) open, short to ground or short to voltage
- circuit 9-CE9 (BN/GN) open, short to ground or short to voltage

PINPOINT TEST B: DTC C1925 VAPS SOLENOID ACTUATOR RETURN CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
B1 ISOLATE THE VARIABLE ASSIST POWER STEERING (VAPS) SOLENOID	
• With the vehicle in neutral, position it on a hoist. Refer to Section 100-02 . • Disconnect: VAPS Solenoid C120. • Measure the resistance across the VAPS solenoid C120, terminals 1 and 2, component side.  • **Is the resistance approximately 6 to 8 ohms?**	**Yes** GO to B2 . **No** INSTALL a new VAPS solenoid. REFER to Section 211-02 . CLEAR The DTC. REPEAT the self-test.
B2 CHECK CIRCUITS 8-CE9 (WH/GN) AND 9-CE9 (BN/GN) FOR A SHORT TO VOLTAGE	

• Measure the voltage between VAPS solenoid C120-1, circuit 8-CE9 (WH/GN), harness side and ground; and between VAPS solenoid C120-2, circuit 9-CE9 (BN/GN), harness side and ground.  N0002912 • **Is voltage present?**	**Yes** REPAIR circuit 8-CE9 (WH/GN) or circuit 9-CE9 (BN/GN). CLEAR the DTC. REPEAT the self-test. **No** GO to B3 .
B3 CHECK CIRCUIT 8-CE9 (WH/GN) FOR AN OPEN	
• Disconnect: FEM Module C201a. • Measure the resistance between VAPS solenoid C120-1, circuit 8-CE9 (WH/GN), harness side and the FEM C201a-9, circuit 8-CE9 (WH/GN), harness side.  N0002913 • **Is the resistance less than 5 ohms?**	**Yes** GO to B4 . **No** REPAIR the open circuit(s). CLEAR the DTC. REPEAT the self-test.
B4 CHECK CIRCUIT 9-CE9 (BN/GN) FOR AN OPEN	
• Measure the resistance between VAPS solenoid C120-2, circuit 9-CE9 (BN/GN), harness side and the FEM C201a-2, circuit 9-CE9 (BN/GN), harness side.  N0002914 • **Is the resistance less than 5 ohms?**	**Yes** GO to B5 . **No** REPAIR circuit 9-CE9 (BN/GN). CLEAR the DTC. REPEAT the self-test.
B5 CHECK CIRCUIT 9-CE9 (BN/GN) FOR A SHORT TO GROUND	
• Measure the resistance between VAPS solenoid C120-2, circuit 9-CE9 (BN/GN), harness side and ground.  N0002915 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B6 . **No** REPAIR circuit 9-CE9 (BN/GN). CLEAR the DTC. REPEAT the self-test.

B6 CHECK CIRCUIT 9-CE9 (BN/GN) AND THE VAPS SOLENOID FOR A SHORT TO GROUND	
• Measure the resistance between VAPS solenoid C120 terminal 2, component side and ground.  N0013097 • **Is the resistance greater than 10,000 ohms?**	**Yes** CARRY OUT the FEM diagnosis. REFER to Section 419-10 . CLEAR the DTC. REPEAT the self-test. **No** INSTALL a new VAPS solenoid. REFER to Section 211-02 . CLEAR the DTC. REPEAT the self-test.

Pinpoint Tests C: Hard Steering/Lack of Assist (No DTCs present)

Normal Operation

The variable assist power steering (VAPS) system provides power assist to steering input by multiplying the turning force applied at the steering wheel. When the vehicle is at rest or at a speed of less than 3.2 km/h (2 mph), the VAPS system supplies maximum assist. Between 3.2 km/h (2 mph) and 191 km/h (119 mph), power assist decreases gradually at a calibrated rate to raise steering efforts for increased directional stability and greater road feel. At greater than 191 km/h (119 mph), steering assist is constant.

Possible Causes

- circuit 8-CE9 (WH/GN) short
- circuit 9-CE9 (BN/GN) short
- VAPS solenoid

PINPOINT TEST C: HARD STEERING/LACK OF ASSIST (NO DTCS PRESENT)

Test Step	Result / Action to Take
C1 CHECK CIRCUITS 8-CE9 (WH/GN) AND 9-CE9 (BN/GN) FOR A SHORT TOGETHER	
• Disconnect: VAPS Solenoid C120. • Measure the resistance between variable assist power steering (VAPS) solenoid C120-1, circuit 8-CE9 (WH/GN), and the VAPS solenoid C120-2, circuit 9-CE9 (BN/GN), harness side.  N0002910 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to C2 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.
C2 CHECK THE VAPS SOLENOID	

• Measure the resistance across the VAPS solenoid C120 terminals 1 and 2, component side.  N0013095 • **Is the resistance greater than 10,000 ohms?**	**Yes** CARRY OUT the front electronic module (FEM) diagnosis. REFER to Section 419-10 . TEST the system for normal operation. **No** INSTALL a new VAPS solenoid. TEST the system for normal operation.

Pinpoint Test D: Steering System Noise

Normal Operation

The power steering pump, which is driven by the crankshaft through a drive belt and pulleys, develops the hydraulic pressure necessary to operate the system. When the engine is running, fluid is drawn into the power steering pump from the power steering pump reservoir. Hydraulic fluid is pressurized in the power steering pump and sent to the steering gear. The rotary valve determines fluid direction to assist the driver in the turning of the vehicle. When the steering wheel is turned, the steering gear converts this hydraulic pressure and flow into mechanical motion which moves the front wheels in the direction of the turn. The steering gear uses tie-rod ends to connect the front knuckles, which then pivot on the ball joints, steering the vehicle.

Possible Causes

- front suspension components
- power steering fluid level
- power steering pump
- steering column
- steering column boot
- steering gear
- steering linkage
- drive belt
- belt tensioner

PINPOINT TEST D: STEERING SYSTEM NOISE

Test Step	Result / Action to Take
D1 CHECK FOR MECHANICAL NOISE	
• Test drive the vehicle to verify the steering system noise. • **Does the steering system make a clunk noise?**	**Yes** CHECK for loose, worn, or damaged tie-rod ends. REFER to Component Tests, Steering Linkage in this section. CHECK for loose or worn steering gear isolators (if applicable). INSTALL new isolators if necessary. REFER to Section 211-02 . If the noise is from the steering column, CHECK the steering column intermediate shaft for grounding

	through the body and repair as necessary. If the noise is from the steering column boot bearing, INSTALL a new steering column boot bearing. REFER to Section 211-04 . If the noise is from the suspension components, INSTALL new suspension components as necessary. REFER to Section 204-00 . If the noise is from loose, worn, or damaged intermediate shaft U-joint(s), INSTALL a new lower steering column shaft. REFER to Section 211-04 . **No** If a squeak is present in the steering column, REPAIR the steering column mountings or align the steering column as necessary. REFER to Section 211-04 . For all other concerns, GO to D2 .
D2 VERIFY THE CONCERN	
NOTE: Make sure the vehicle is on a flat dry surface, the transmission is in PARK, and the windows are rolled up. **NOTE:** Some power steering noise is expected. If in doubt of the acceptability of the noise level, evaluate another vehicle of the same model and powertrain. • Key in START position. • Turn the steering wheel one-half turn off-center to the right, then one-half turn off-center to the left. • **Is the power steering noisy?**	**Yes** If a grunt noise is present, VERIFY the steering column boot is OK and the exhaust system is not grounding out. If a moan is present, VERIFY the tie-rod ends and ball joints are OK. GO to D3 . **No** If a squeal is present, INSPECT and INSTALL a new engine drive belt or belt tensioner as necessary. REFER to Section 303-05 . If the steering system noise is a hiss or whistle, INSPECT the steering column boot at the dash panel. REPAIR or INSTALL a new boot as necessary. REFER to Section 211-04 . INSPECT the steering gear input shaft and valve for wear or damage. REFER to Section 211-02 .

	INSPECT the power steering gear, intermediate shaft, and power steering lines and hoses for grounding to the body and REPAIR as necessary. INSPECT for openings or missing plugs in the instrument panel cowl and REPAIR as necessary. If there are no missing plugs or openings in the cowl, or no grounded power steering gear, intermediate shaft, power steering lines, or hoses, GO to D6 .
D3 CHECK FOR COLD START NOISE	
NOTE: Some noise during an extremely cold start (-25.5°C [-14°F]) is normal and should improve as the steering system warms up, usually within 60 seconds. • Key in START position. • Verify the noise condition. • **Is the noise present only during cold start-up?**	**Yes** CHECK for contamination in the power steering reservoir screen. FLUSH the power steering system as necessary. REFER to Power Steering System Flushing in this section. TEST the system for normal operation. **No** GO to D4 .
D4 INSPECT THE POWER STEERING FLUID	
• Key in OFF position. • With the engine OFF, inspect the power steering fluid for aeration. • **Is the power steering fluid foamy or aerated?**	**Yes** GO to D5 . **No** PURGE the power steering system. REFER to Power Steering System Purging in this section. If a whine or a moan is still present, INSTALL a new power steering pump. REFER to Section 211-02 . If the power steering noise is a grunt, INSTALL a new power steering gear. REFER to Section 211-02 .
D5 CHECK THE POWER STEERING FLUID LEVEL WITH THE ENGINE ON AND OFF	
NOTE: Record the vacuum level when the pump noise occurs with no steering input. The vacuum level should be greater than 34 kPa (10 in-Hg) with the CII pump and greater than 51 kPa (15 in-Hg) with the CIII pump. • Key in START position. • With the engine running, inspect the power steering fluid level. • Key in OFF position.	**Yes** PURGE the power steering system. REFER to Power Steering System Purging in this section. **No** GO to D6 .

• With the engine off, inspect the power steering fluid level. • **Does the power steering fluid level change with the engine off?**	
D6 CHECK THE POWER STEERING PUMP	
NOTE: Do not turn the steering wheel to either the right or left stop. Power steering relief noise will occur and is normal at the stop positions. • Key in START position. • With the engine running, rotate the steering wheel 90 degrees to the left, then to the right. • **Does the frequency of the hiss change between the left and right positions?**	**Yes** INSTALL a new power steering gear. REFER to Section 211-02 . **No** INSTALL a new power steering pump. REFER to Section 211-02 .

Pinpoint Test E: Steering is Very Difficult/Very Easy

Normal Operation

The power steering pump, which is driven by the crankshaft through a drive belt and pulleys, develops the hydraulic pressure necessary to operate the system. When the engine is running, fluid is drawn into the power steering pump from the power steering pump reservoir. Hydraulic fluid is pressurized in the power steering pump and sent to the steering gear. The rotary valve determines fluid direction to assist the driver in the turning of the vehicle. When the steering wheel is turned, the steering gear converts this hydraulic pressure and flow into mechanical motion that moves the front wheels in the direction of the turn. The steering gear uses tie-rod ends to connect the front knuckles, which then pivot on the ball joints, steering the vehicle.

Possible Causes

- intermediate shaft
- intermediate shaft U-joints
- steering column
- steering column bearings
- steering gear
- power steering pump
- power steering hoses
- ball joints

PINPOINT TEST E: STEERING IS VERY DIFFICULT/VERY EASY

Test Step	Result / Action to Take
E1 CHECK THE STEERING COLUMN BEARINGS AND THE INTERMEDIATE SHAFT	
NOTE: Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to Section 501-20B . • Check the steering column and intermediate shaft for grounding.	**Yes** GO to E2 . **No** If the steering column or the intermediate shaft are grounding, REPAIR as necessary. If the steering column bearings or the intermediate shaft are binding, INSTALL a new intermediate shaft or

• Disconnect the steering column intermediate shaft at the steering column. • Verify that the intermediate shaft u-joints do not bind and move freely, and the steering column bearing rotates freely. • **Are the steering column bearing and intermediate shaft u-joints OK?**	steering column. REFER to Section 211-04 .
E2 CHECK THE FRONT BALL JOINTS	
• Check that the front ball joints move freely and are not binding or sticking. Refer to Section 204-00 . • **Are the front ball joints OK?**	**Yes** GO to E3 . **No** INSTALL new ball joints as necessary. REFER to Section 204-01 .
E3 MONITOR ANY ENGINE RPM CHANGES	
NOTE: Make sure the vehicle is on a flat, dry surface. • Key in START position. • ⚠ **CAUTION: Do not hold the steering wheel at the stops for an extended amount of time. Damage to the power steering pump can occur.** • Turn the steering wheel once to the left stop position and then to the right stop position. • Note the engine rpm during the turns. • **Does the engine rpm change when turning the steering wheel?**	**Yes** If no power steering assist is present and the engine rpm changes, INSTALL a new steering gear. REFER to Section 211-02 . If left-to-right variation is present, INSTALL a new steering gear. REFER to Section 211-02 . If no power steering assist is present and the engine rpm does not change, INSTALL a new power steering pump. REFER to Section 211-02 . If excessive effort is required in one or both directions, INSTALL a new power steering pump. REFER to Section 211-02 . **No** GO to E4 .
E4 CHECK THE VARIABLE ASSIST POWER STEERING (VAPS) SYSTEM	
• Carry out the pump flow and pressure test. Refer to Component Tests in this section. • **Does the pump flow and pressure test pass?**	**Yes** Go To Pinpoint Test C . **No** INSTALL a new power steering pump. REFER to Section 211-02 .

Pinpoint Test F: Excessive Steering Wheel Play

Normal Operation

When the steering wheel is turned, the steering shaft rotates in the steering column on bearings. This mechanical motion is then converted to hydraulic pressure that reduces the effort that it takes to steer the vehicle. This hydraulic pressure from the power steering pump to the power steering gear is then converted back to mechanical motion that moves the front wheels in the direction of the turn. The steering gear uses tie-rod ends to connect the front knuckles to one another. The knuckles then pivot on the ball joints in order to steer the vehicle.

Possible Causes

- steering column bearing
- steering linkage
- suspension components

PINPOINT TEST F: EXCESSIVE STEERING WHEEL PLAY

Test Step	Result / Action to Take
F1 CHECK THE STEERING COLUMN BEARING	
• Inspect the steering column mounting fasteners and bearing for looseness. • **Are the fasteners and bearing OK?**	**Yes** GO to F2 . **No** TIGHTEN the steering column mounting fasteners or INSTALL a new steering column. REFER to Section 211-04 .
F2 CHECK THE STEERING LINKAGE FOR LOOSENESS	
• Carry out the Steering Linkage component test. Refer to Component Tests in this section. • **Is the steering linkage OK?**	**Yes** REFER to Section 204-00 to diagnose the suspension components. **No** INSTALL new steering linkage as necessary. REFER to Section 211-02 .

Pinpoint Test G: Steering System Drift/Pull/Wander

Normal Operation

When the steering wheel is turned, the steering shaft rotates in the steering column on bearings. This mechanical motion is then converted to hydraulic pressure that reduces the effort that it takes to steer the vehicle. This hydraulic pressure from the power steering pump to the power steering gear is then converted back to mechanical motion that moves the front wheels in the direction of the turn. The steering gear uses tie-rod ends to connect the front knuckles to one another. The knuckles then pivot on the ball joints in order to steer the vehicle.

Possible Causes

- steering gear
- intermediate shaft
- intermediate shaft U-joints
- steering gear mounts
- suspension components

PINPOINT TEST G: STEERING SYSTEM DRIFT/PULL/WANDER

Test Step	Result / Action to Take
G1 CHECK FOR TIRE PULL	
• Rotate the front wheel and tire assemblies side-to-side. Refer to Section 204-04 . • Carry out a road test on a smooth, flat road. • **Does the vehicle drift/pull?**	**Yes** If the vehicle pulls in the opposite direction, GO to G2 . If the vehicle pulls in the original direction, GO to G3 . **No** The concern has been corrected.
G2 ROTATE THE WHEEL AND TIRE ASSEMBLIES FRONT TO REAR	
• Rotate the wheel and tire assemblies front to rear. Refer to Section 204-00 . • Carry out a road test on a smooth, flat road. • **Does the vehicle drift/pull?**	**Yes** GO to G3 . **No** The concern has been corrected.
G3 CHECK THE STEERING COLUMN INTERMEDIATE SHAFT	
NOTE: Be sure to keep the clockspring centered when disconnecting the intermediate shaft. Refer to Section 501-20B . • Check the steering column and intermediate shaft for grounding. • Disconnect the steering column intermediate shaft at the steering column. • Inspect the steering column intermediate shaft U-joints for looseness or wear. • **Are the steering column intermediate shaft U-joints OK?**	**Yes** GO to G4 . **No** INSTALL a new steering column intermediate shaft. REFER to Section 211-04 .
G4 CHECK THE STEERING GEAR MOUNTING	
• Check the steering gear mounts for looseness or wear. • **Are the steering gear mounts OK?**	**Yes** GO to G5 . **No** INSTALL new steering gear mounts. REFER to Section 211-02 .
G5 CHECK THE STEERING GEAR	
• Carry out the Steering Gear Valve component test. Refer to Component Tests in this section. • **Is the steering gear valve OK?**	**Yes** GO to G6 . **No** REPAIR or INSTALL a new steering gear. REFER to Section 211-02 .
G6 CHECK THE SUSPENSION COMPONENTS	

• Check for loose or worn suspension components. Refer to Section 204-00 . • **Are the suspension components OK?**	**Yes** GO to G7 . **No** INSTALL new suspension components. REFER to Section 204-01 for the front suspension or Section 204-02 for the rear suspension.
G7 CHECK THE WHEEL ALIGNMENT	
NOTE: The vehicle will tend to pull toward the side with the least positive caster and the most positive camber. • Using a suitable alignment system, measure the wheel alignment settings. Refer to Section 204-00 . • **Are the alignment settings within specification?**	**Yes** CHECK for correct frame alignments. REFER to Section 502-00 . **No** ADJUST the alignment angles to specifications. DO NOT exceed specifications. TEST the system for normal operation.

Component Tests

Steering Linkage

1. **NOTE:** Excessive vertical motion of the studs relative to the sockets may indicate excessive wear.

   With the vehicle on the ground and the parking brake applied, start the engine and carry out the following:

   - Have an assistant rotate the steering wheel back and forth 360 degrees and watch for relative motion of the studs in the steering linkage ball sockets.
   - Watch for loose steering gear mounting.

2. As an additional check, with the key ON engine OFF (KOEO) and the front wheels raised off the ground, grasp the wheel at the front and rear and watch for excessive play or binding in the joints while trying to steer the wheels.

3. **NOTE:** Incorrect separation of the tapered stud from its seat will cause premature failure of the ball socket.

   The joints can be checked for excessive wear by measuring the torque it takes to turn the stud.

   1. Separate the tapered stud from its seat and thread the attaching nut back onto the stud.
   2. **NOTE:** Some joint turning torques will be as little as 0.2 Nm (2.0 lb-in) within the first 1,600 km (1,000 miles) and will remain there for the life of the joint.

      Turn the stud with an inch-pound torque wrench and note the torque required to turn the stud.

Torque Required to Turn Stud in Socket	
Nm	**Lb-In**

New joints	2.0-5.0	18.0-47.0
Used joints	0.2-3.0	2.0-26.0
Joints with excessive play	Less than 0.2	Less than 2.0

4. Install new components if necessary. Tighten any worn, damaged, or loose components.

Turning Effort Test

NOTE: Make sure the front wheels are correctly aligned and the tire pressure is correct before checking the steering effort.

1. Park the vehicle on dry concrete and set the parking brake.

2. Insert a thermometer into the power steering oil reservoir.

3. **⚠ CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

   Idle the engine for 2 to 3 minutes. Turn the steering wheel from stop-to-stop several times to warm the fluid to 50-60°C (122-140°F).

4. With the engine running, attach the spring scale to the rim of the steering wheel.

5. Measure the pull required to turn the steering wheel one complete revolution in each direction. Refer to General Specifications, Steering Wheel Turning Effort in this section.

Pump Flow and Pressure Test

⚠ WARNING: Do not touch the flowmeter during the test procedure or severe burns and serious injury can occur. Failure to follow these instructions may result in personal injury.

1. **⚠ CAUTION: Make sure the connection point does not interfere with any of the engine accessory drive components or drive belts.**

   Install the power steering analyzer at the high pressure port of the power steering pump. Make sure the power steering analyzer gate valve is fully open.

2. Place a dial thermometer in the power steering pump reservoir.

3. Check the power steering fluid level. If necessary, add the specified power steering fluid.

4. Install a digital tachometer.

5. **⚠ CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

   Start the engine. Set the parking brake. Place the transmission in NEUTRAL. Raise the power steering fluid temperature to 74-80°C (165-175°F) by rotating the steering wheel fully to the left and right several times.

6. With the steering wheel in the straight-ahead position, set the engine speed to 2,100 rpm. Record the flow rate and pressure readings.
   - If the flow rate is less than the flow rate specification, continue with the test procedure.

- If the pressure reading is greater than the maximum pressure specification, check the power steering hoses for kinks and restrictions.

7. Partially close the gate valve to obtain 5,171 kPa (750 psi). Set the engine speed at idle. Record the flow rate.
   - If the flow is less than the specified flow rate, install a new power steering pump.

8. ⚠ **CAUTION: Do not allow the gate valve to remain closed for more than 5 seconds.**

   Completely close and partially open the gate valve 3 times. Record the pressure relief valve actuation pressure reading.

   - If the pressure does not meet the relief pressure specification, install a new power steering pump.

9. Set the engine speed to 2,100 rpm. Record the flow rate.
   - If the flow rate varies more than 3.785 liters/minute (1 gallon/minute) from the initial flow rate reading, install a new power steering pump.

10. ⚠ **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

    Set the engine speed to idle. Turn (or have an assistant turn) the steering wheel to the left and right stops. Record the flow rate and pressure readings at the stops.

    - The pressure reading at both stops should be nearly the same as the maximum pump relief pressure.
    - The flow rate should drop to less than 1.9 liters/minute (0.5 gallons/minute).
    - If the pressure does not reach the maximum pump relief pressure or the flow rate does not drop to less than the specified value, excessive internal leakage is occurring. Install a new steering gear as necessary. Refer to Section 211-02 .

11. Turn (or have an assistant turn) the steering wheel slightly in both directions and release quickly while watching the pressure gauge.
    - The pressure reading should move from the normal back pressure reading and snap back as the steering wheel is released.
    - If the pressure returns slowly or sticks, the rotary valve in the steering gear is sticking or the steering column is binding. Check the steering column and linkages before repairing the steering gear.

Tie-Rod Articulation Torque

NOTE: This check may be done with the steering gear on or off the vehicle.

1. Disconnect the tie-rod end from the front wheel knuckle. Refer to Section 211-02 .

2. Move the front wheel knuckle tie-rod back and forth 3 times.

3. Hook a spring scale over the tie-rod end, or the threaded portion of the front wheel knuckle tie-rod, and measure the force required to move the front wheel knuckle tie-rod. Refer to General Specifications, Tie-Rod Articulation Torque in this section.

4. If the force required to move the front wheel knuckle tie-rod does not meet the specification, install a new front wheel knuckle tie-rod. Refer to Section 211-02 .

Steering Gear Valve

1. With the vehicle in motion, place the transmission in NEUTRAL and turn the engine OFF.
   - If the vehicle does not pull with the engine OFF, repair or install a new steering gear. Refer to Section 211-02 .

2. If the vehicle pulls with the engine OFF, switch the right side front wheel to the left side of the vehicle and the left side front wheel to the right side of the vehicle.

3. If the vehicle pulls to the opposite side, switch the front wheels with the rear wheels keeping them on the same side of the vehicle.

4. If the vehicle pull direction does not change, check the front suspension components, wheel alignment, and frame alignment. Refer to Section 204-00 or an appropriate frame dimensions manual.

Power Steering System Filling

ST2826-A	Fill Adapter Manifold, Power Steering 211-327 or equivalent

Material

Item	Specification
MERCON® Multi-Purpose ATF Transmission Fluid XT-2-QDX	MERCON®

1. ⚠ **CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure can result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.**

   Remove the power steering pump reservoir cap.

2. Tightly install the evacuation cap to the power steering pump reservoir.

3. Install the hose from the fill adapter manifold tee to the evacuation cap on the power steering pump reservoir.

4. Install the vacuum pump to the fill adapter manifold control valve.

5. Install the hose to the opposite fill adapter manifold control valve and submerge the open end of the hose into a container of new power steering fluid.

6. **NOTE:** The fill adapter manifold control valves are in the open position when the point of the handles face the center of the fill adapter manifold.

   Close the fill adapter manifold control valve connected to the power steering fluid container.

7. Open the fill adapter manifold control valve connected to the vacuum pump.

8. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

9. Observe the vacuum gauge for 30 seconds.

10. If the vacuum gauge reading drops more than 3 kPa (0.88 in-Hg), correct any leaks in the power steering system or the filling tools before proceeding.

11. **NOTE:** The vacuum pump gauge reading will drop slightly during this step.

    Slowly open the fill adapter manifold control valve connected to the power steering fluid container until power steering fluid completely fills the hose.

12. Close the fill adapter manifold control valve connected to the power steering fluid container.

13. Using the vacuum pump, apply 68-85 kPa (20-25 in-Hg) of vacuum to the power steering system.

14. Close the fill adapter manifold control valve connected to the vacuum pump.

15. Slowly open the fill adapter manifold control valve connected to the power steering fluid container.

16. When the power steering fluid has drained from the hose connected to the power steering fluid container, close the fill adapter manifold control valve connected to the power steering fluid container.

17. Remove the tools from the vehicle.

18. Install the power steering reservoir cap.

19. ⚠ **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

    NOTE: There will be a slight drop in the power steering fluid level in the power steering fluid reservoir when the engine is started.

    Start the engine and turn the steering wheel from stop-to-stop.

20. If equipped with Hydro-Boost®, apply the brake pedal twice.

21. Turn the ignition switch to the OFF position.

22. ⚠ **CAUTION: Do not overfill the reservoir.**

    Remove the power steering reservoir cap and fill the reservoir.

23. Install the power steering reservoir cap.

Power Steering System Flushing

Printable View (13 KB)

Material

Item	Specification
MERCON® Multi-Purpose ATF Transmission Fluid XT-2-QDX	MERCON®

⚠ WARNING: Do not mix oil types. Any mixture or any unapproved oil can lead to seal deterioration and leaks. A leak can ultimately cause loss of fluid, which can result in a loss of power steering assist. Failure to follow these instructions may result in personal injury.

1. Remove the power steering fluid reservoir cap.
2. Using a suitable suction device, remove the power steering fluid from the reservoir.
3. Disconnect the power steering fluid return hose from the reservoir.
   - Remove the clamp.
4. Plug the power steering fluid reservoir inlet port.
5. Attach an extension hose to the power steering return hose.
6. **NOTE:** Do not reuse the power steering fluid that has been flushed from the power steering system.

   Place the open end of the extension hose into a suitable container.
7. **⚠ CAUTION: Do not overfill the reservoir.**

   Fill the power steering fluid reservoir with new fluid.
8. **⚠ CAUTION: Do not allow the power steering pump to run completely dry of power steering fluid.**

   Start the engine while simultaneously turning the steering wheel to lock and then immediately turn the ignition switch to the OFF position.
9. **⚠ CAUTION: Avoid turning the steering wheel without the engine running as this may cause air to be pulled into the steering gear.**

   ⚠ CAUTION: Do not overfill the reservoir.

   Fill the power steering fluid reservoir with the approved power steering fluid.
10. Repeat Steps 8 and 9, turning the steering wheel in the opposite direction each time, until the fluid exiting the power steering fluid return hose is clean and clear of foreign material.
11. Remove the extension hose from the power steering return hose.

12. Remove the plug from the power steering fluid reservoir inlet port.

13. Install the power steering return hose to the reservoir.
    - Install the clamp.

14. **NOTE:** It is necessary to properly fill the power steering system to remove any trapped air and completely fill the power steering system components.

    If, after properly filling the power steering system, there is power steering noise accompanied by evidence of aerated fluid and there are no fluid leaks, it may be necessary to purge the power steering system. For additional information, refer to Power Steering System Purging in this section.

    Fill the power steering system. For additional information, refer to Power Steering System Filling in this section.

MERCON® Multi-Purpose ATF Transmission Fluid XT-2-QDX	MERCON®

⚠ CAUTION: If the air is not purged from the power steering system correctly, premature power steering pump failure can result. The condition can occur on pre-delivery vehicles with evidence of aerated fluid or on vehicles that have had steering component repairs.

1. **NOTE:** A whine heard from the power steering pump can be caused by air in the system. The power steering purge procedure must be carried out prior to any component repair for which power steering noise complaints are accompanied by evidence of aerated fluid.

   Remove the power steering pump reservoir cap. Check the fluid.

2. Raise the front wheels off the floor. Refer to the appropriate section in Group 100 for the procedure.

3. Tightly insert the stopper of the vacuum pump into the reservoir.

4. Start the engine.

5. Install the vacuum pump, apply vacuum, and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).

6. If equipped with Hydro-Boost®, apply the brake pedal twice.

7. **⚠ CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

   Cycle the steering wheel fully from stop-to-stop 10 times.

8. Stop the engine.

9. Release the vacuum and remove the vacuum pump.

10. **⚠ CAUTION: Do not overfill the reservoir.**

Fill the reservoir.

- Use approved transmission fluid.

11. Start the engine.
12. Install the vacuum pump. Apply and maintain the maximum vacuum of 68-85 kPa (20-25 in-Hg).
13. ⚠ **CAUTION: Do not hold the steering wheel against the stops for more than 3 to 5 seconds at a time. Damage to the power steering pump can occur.**

    Cycle the steering wheel fully from stop-to-stop 10 times.
14. Stop the engine, release the vacuum and remove the vacuum pump.
15. ⚠ **CAUTION: Do not overfill the reservoir.**

    Fill the reservoir as needed and install the reservoir cap.
16. Visually inspect the power steering system for leaks.
17. ⚠ **CAUTION: Do not overfill the reservoir.**

    Fill the reservoir as needed and visually inspect the power steering system for leaks.
18. Install the reservoir cap.

General Specifications

Item	Specification
Lubricant	
Premium Long Life Grease XG-1-C	ESA-M1C75-B

Torque Specifications

Description	Nm	lb-ft	lb-in
Power Steering System			
Air conditioning compressor bolts	25	18	
Cooler-to-radiator bolts	10		89
Fluid cooler-to-radiator bolts	10		89
Inner tie-rod	100	74	
Intermediate shaft slider bolt	35	26	
Intermediate shaft-to-steering gear bolt	35	26	
Lower reservoir isolator bolt	10		89
Power steering line retainer bracket bolt	10		89
Pressure line fitting	33	24	
Pump bolts (upper/lower)	25	18	
Radiator hose tube-to-engine bolts	10		89
Steering line clamp plate bolt	10		89
Steering gear-to-crossmember nuts and bolts	103	76	
Tie-rod end jam nut	55	41	
Tie-rod end nut	80	59	
Upper reservoir isolator bolt	4		35
Variable assist power steering (VAPS) actuator bolts	3		27

Power Steering

Printable View (7 KB)

The power steering system consists of the following:

- power steering pump
- fluid reservoir
- rack-and-pinion steering gear
- fluid cooler
- power steering pressure and return lines/hoses
- variable assist power steering (VAPS) actuator

Power Steering

Printable View (7 KB)

Refer to Section 211-00 .

Inner Tie Rod

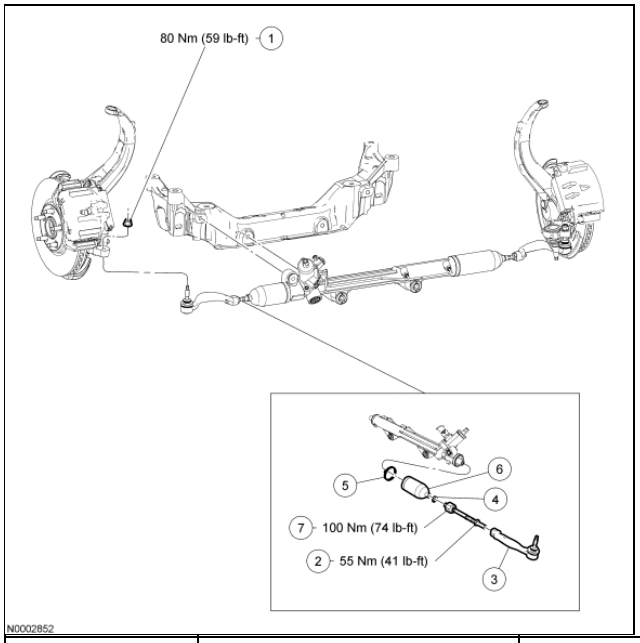
Printable View (147 KB)

Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D027 (D90P-3517-A) or equivalent
 ST1301-A	Installer, Constant Velocity Boot Clamp 205-343 (T95P-3514-A)

Material

Item	Specification
Premium Long Life Grease XG-1-C	ESA-M1C75-B



Item	Part Number	Description
1	W520214-S427	Tie-rod end nut
2	W709537-S309	Tie-rod end jam nut
3	3A130	Tie-rod end
4	3C650	Outer bellows clamp
5	3C650	Inner bellows clamp
6	3K661	Steering gear bellows
7	3280	Inner tie-rod

Removal

⚠ CAUTION: The boots and clamps are designed to provide an airtight seal and protect the internal components of the steering gear. If the seal is not airtight the vacuum generated during turning draws water and contamination into the gear causing premature damage.

⚠ CAUTION: Zip ties do not produce an airtight seal and must not be used.

⚠ CAUTION: The inner ball joint grease is not compatible with water, and contamination trapped in the grease degrades the life of the joint.

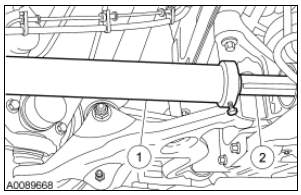
⚠ CAUTION: If present, the orientation of the vent tube must be noted so the boots and vent tubes can be installed in the correct location.

1. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
2. Remove the tie-rod end nut.
3. Loosen the tie-rod end jam nut.
4. **NOTE:** Count the number of turns required to remove the tie-rod end for reference during installation.

   Disconnect the tie-rod end from the wheel knuckle and remove the tie-rod end.
5. Remove the tie-rod end jam nut.
6. Remove the outer bellows clamp.
7. Remove and discard the inner bellows clamp.
8. Remove the steering gear bellows.
9. **⚠ CAUTION: Place the steering gear at the center position. Use a 15/16 in. crowfoot on the flat of the rack gear to resist rotation and to prevent damage during removal and installation of the inner tie-rod.**

   NOTE: An assistant may be needed for removal of the RH inner tie-rod.

   Using the (1) special tool, remove the (2) inner tie-rod.



Installation

1. **⚠ CAUTION: Remove any abrasive material. This material is extremely harmful to the steering gear.**

   Using the special tool, install the inner tie-rod.

   - Tighten to 100 Nm (74 lb-ft).

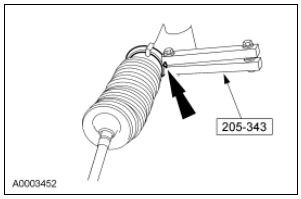
2. ⚠ **CAUTION: Make sure the steering gear bellows is positioned between the 2 grooves on the inner tie-rod or an internal leak can result.**

   NOTE: Lubricate the inner tie-rod groove with steering gear grease where the steering gear bellows is clamped.

   Install the steering gear bellows.

3. **NOTE:** Check that the steering gear bellows is not twisted and the vent tube (if equipped) is securely inserted into the vent nipple in the steering gear bellows.

   Using the special tool, install the inner bellows clamp.



4. Install the outer bellows clamp.

5. Thread the tie-rod end jam nut onto the inner tie-rod.

6. Install the tie-rod end the same number of turns noted during removal.

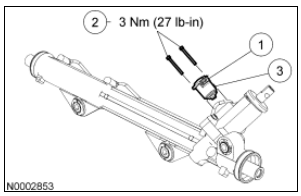
7. Connect the tie-rod end to the wheel knuckle and install the nut.
   - Tighten to 80 Nm (59 lb-ft).

8. Tighten the tie-rod end jam nut.
   - Tighten to 55 Nm (41 lb-ft).

9. Check and, if necessary, align the front wheels. For additional information, refer to Section 204-00 .

Power Steering Control Valve Actuator

Printable View (29 KB)



Item	Part Number	Description
1		Variable assist power steering (VAPS) actuator electrical connector (part of 14401)
2		VAPS actuator bolts (2 required)
3	3N803	VAPS actuator

Removal and Installation

1. Disconnect the VAPS actuator electrical connector.

2. Remove the 2 bolts and the VAPS actuator.
   - To install, tighten to 3 Nm (27 lb-in).

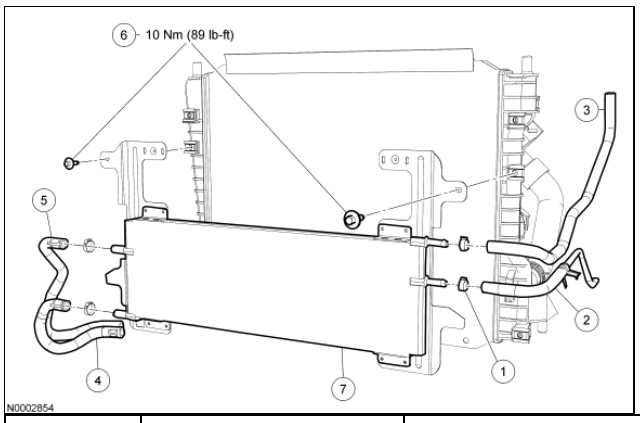
3. To install, reverse the removal procedure.

Power Steering Fluid Cooler

Printable View (113 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Boot Clamp 205-343 (T95P-3514-A)



Item	Part Number	Description
1	3C750	Hose clamps (4 required)
2	3A713	Steering gear-to-cooler hose
3	3493	Cooler-to-reservoir return hose
4	7A030	Lower transmission cooler line
5	7A031A	Upper transmission cooler line
6	W500211-S426	Cooler-to-radiator bolts (2 required)
7	3F749	Power steering fluid cooler

Removal and Installation

⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. Remove the air conditioning condenser. For additional information, refer to Section 412-03 .

2. Remove and discard the 4 hose clamps.

3. Remove the steering gear-to-cooler hose.
   - Allow the fluid to drain into a suitable container.

4. Remove the cooler-to-reservoir return hose.

5. Remove the lower transmission cooler line.
   - Allow the fluid to drain into a suitable container.

6. Remove the upper transmission cooler line.

7. Remove the 2 bolts and the power steering fluid cooler.

Installation

1. Install the power steering fluid cooler and the 2 bolts.
   - Tighten to 10 Nm (89 lb-in).

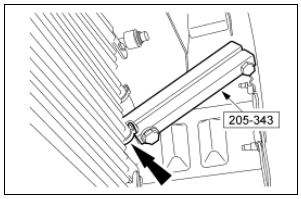
2. Install the hose clamp and the upper transmission cooler line.

3. Install the hose clamp and the lower transmission cooler line.

4. Install the hose clamp and the cooler-to-reservoir return hose.

5. Install the hose clamp and the steering gear-to-cooler hose.

6. Using the special tool, tighten the 4 hose clamps.



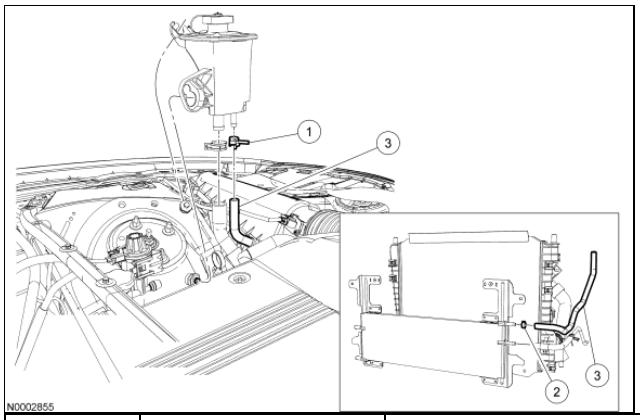
7. Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Fluid Cooler to Power Steering Fluid Reservoir Return Hose

Printable View (143 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Boot Clamp 205-343 (T95P-3514-A)



Item	Part Number	Description
1		Reservoir return hose clamp
2	3C750	Cooler-to-reservoir return hose clamp
3	3A713	Cooler-to-reservoir return hose

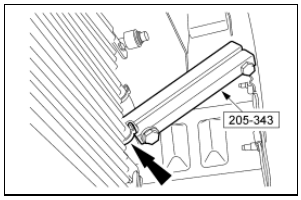
Removal

⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. Remove the air conditioning condenser. For additional information, refer to Section 412-03 .
2. Using a suitable suction device, drain the power steering fluid reservoir.
3. Remove the clamp and disconnect the cooler-to-reservoir return hose at the reservoir.
4. Remove the cooler-to-reservoir return hose clamp and the hose.

Installation

1. Install the cooler-to-reservoir return hose clamp and the hose.
2. Using the special tool, tighten the cooler-to-reservoir return hose clamp.



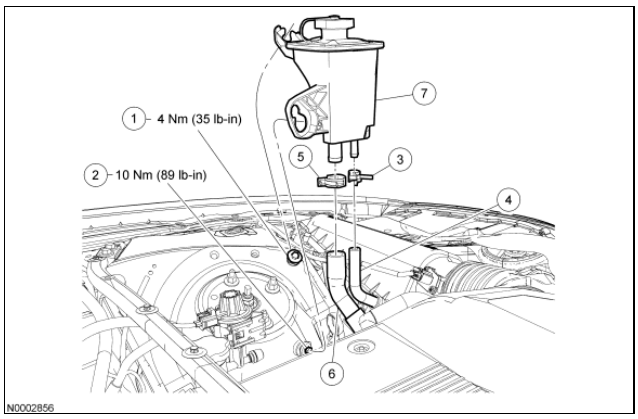
3. Connect the cooler-to-reservoir return hose at the reservoir and install the clamp.

4. Install the air conditioning condenser. For additional information, refer to Section 412-03 .

5. Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Fluid Reservoir

Printable View (113 KB)



Item	Part Number	Description
1	N803882	Upper reservoir isolator bolt
2	W705012-S306	Lower reservoir isolator bolt
3	3A713	Cooler-to-reservoir return hose clamp
4	3A713	Cooler-to-reservoir return hose
5	3691	Reservoir-to-pump supply hose clamp
6	3691	Reservoir-to-pump supply hose
7	3E764	Fluid reservoir

Removal and Installation

⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. Using a suitable suction device, drain the fluid reservoir.

2. Loosen the upper reservoir isolator bolt.
   - To install, tighten to 4 Nm (35 lb-in).

3. Loosen the lower reservoir isolator bolt.
   - To install, tighten to 10 Nm (89 lb-in).

4. Disconnect the cooler-to-reservoir return hose clamp and remove the hose.

5. Disconnect the reservoir-to-pump supply hose clamp and remove the hose.

6. Lift the fluid reservoir upward off of the isolators.

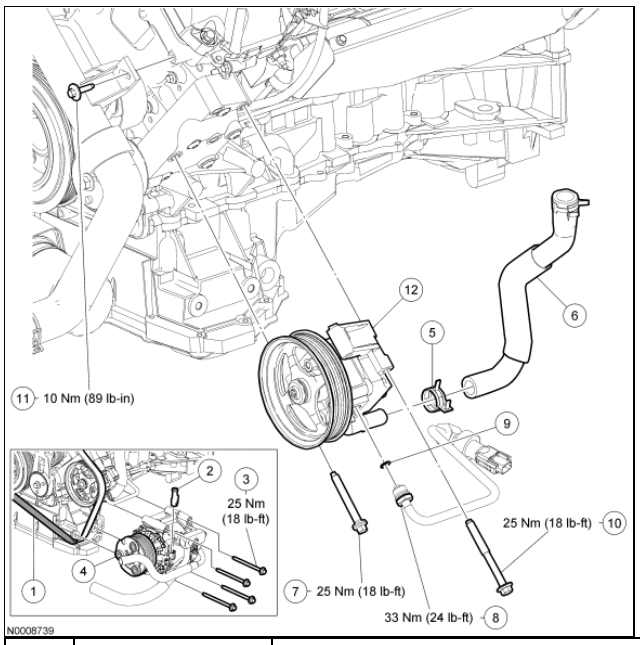
7. To install, reverse the removal procedure.
   - Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Pump

Printable View (257 KB)

Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D027 (D90P-3517-A) or equivalent



Item	Part Number	Description
1	8620	Engine accessory drive belt
2		Air conditioning compressor electrical connector (3.9L only)
3	W705825-S	Air conditioning compressor bolts (3.9L only, 4 required)
4	19703	Air conditioning compressor (3.9L only)
5		Reservoir-to-pump supply hose clamp (part of 3691)
6	3691	Reservoir-to-pump supply hose
7	W704792-S309	Lower pump bolts (2 required)
8	3A713	Pressure line fitting
9	3E764	Teflon® seal
10	W704752-S309	Upper pump bolts (2 required)
11	W503925-S	Radiator hose tube-to-engine bolt (3.9L engine only, 2 required)
12	3A696	Power steering pump

Removal and Installation

⚠ CAUTION: Do not remove the power steering pulley from the power steering pump. The power steering pulley is not removable and damage to the pulley may occur.

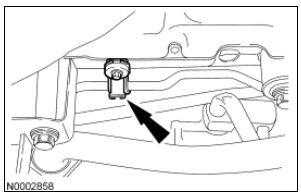
⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

All vehicles

1. Remove the engine appearance cover.
2. Remove the air cleaner and the air cleaner outlet tube. For additional information, refer to Section 303-04A for 3.0L (4V) engine or Section 303-04B for 3.9L engine.
3. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .
4. Remove the LH front frame rail deflector shields.
5. Rotate the tensioner and remove the engine accessory drive belt from the power steering pump pulley.

3.9L engine

6. Disconnect the air conditioning compressor electrical connector.
7. Remove the power steering line retainer bracket bolt and position the bracket aside.



8. Remove the 4 bolts and position the air conditioning compressor aside.

All vehicles

9. Disconnect the reservoir-to-pump supply hose clamp and remove the hose.
10. Remove the 2 lower pump bolts.
11. Disconnect the pressure line fitting.
12. Remove and discard the Teflon® seal.
13. Remove the 2 upper pump bolts.

3.9L engine

14. Remove the 2 radiator hose tube-to-engine bolts.

All vehicles

15. Remove the pump.

Installation

All vehicles

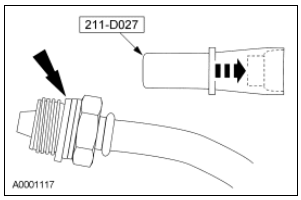
1. Install the pump and the 2 upper pump bolts.
    - Tighten to 25 Nm (18 lb-ft).

3.9L engines

2. Install the 2 radiator hose tube-to-engine bolts.
    - Tighten to 10 Nm (89 lb-in).

All vehicles

3. Using the special tool, install a new Teflon® seal on the pressure line fitting.



4. Install the pressure line fitting.
    - Tighten to 33 Nm (24 lb-ft).

5. Install the 2 lower pump bolts.
    - Tighten to 25 Nm (18 lb-ft).

6. Install the reservoir-to-pump supply hose and connect the clamp.

3.9L engines

7. Install the air conditioning compressor and the 4 bolts.
    - To install, tighten to 25 Nm (18 lb-ft).

8. Install the power steering line retainer bracket and bolt.
    - Tighten to 10 Nm (89 lb-in).

9. Connect the air conditioning compressor electrical connector.

All vehicles

10. Rotate the tensioner and install the engine accessory drive belt on the power steering pump pulley.

11. Install the LH front frame rail deflector shields.

12. Install the air cleaner outlet tube and the air cleaner. For additional information, refer to Section 303-04A for 3.0L (4V) engine or Section 303-04B for 3.9L engine.

13. Install the engine appearance cover.

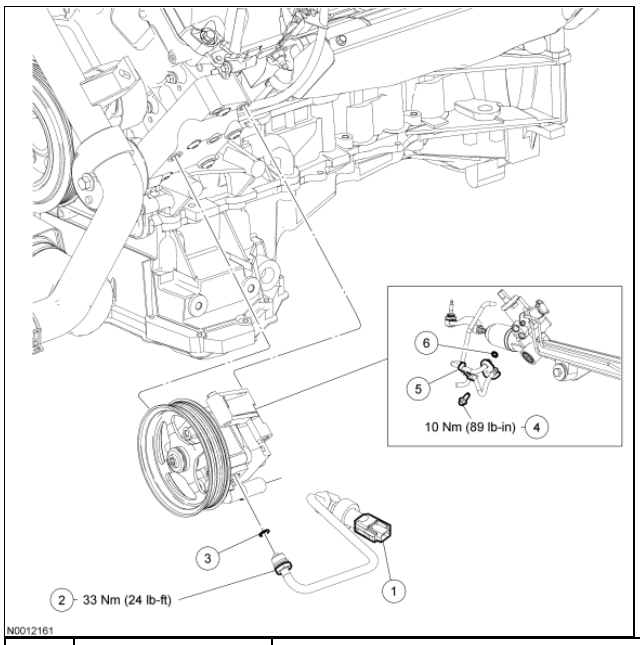
14. Fill the power steering system. For additional information, refer to Section 211-00 .

Power Steering Pump to Steering Gear Pressure Line

Printable View (209 KB)

Special Tool(s)

 ST1444-A	Installer Set, Teflon® Seal 211-D027 (D90P-3517-A) or equivalent



Item	Part Number	Description
1		Power steering pressure (PSP) switch electrical connector (part of 14401)
2		Pressure line fitting (part of 3A719)
3	3E764	Teflon® seal
4	W708113-S426	Steering line clamp plate bolt
5	3A713	Pressure line
6	3F886-AA	O-ring seal

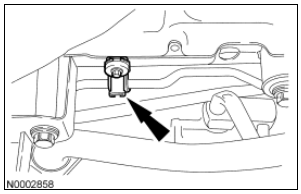
Removal

⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. Disconnect the PSP switch electrical connector.

2. Disconnect the pressure line fitting and discard the Teflon® seal.
   - Allow the fluid to drain into a suitable container.

3. Remove the power steering line retainer bracket bolt.



4. Remove and discard the steering line clamp plate bolt.

5. Rotate the steering line clamp plate and remove the pressure line.
    - Discard the O-ring seal.

Installation

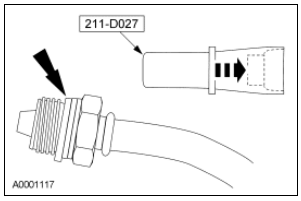
1. Install a new O-ring seal on the pressure line.

2. Install the pressure line to the steering gear and rotate the steering line clamp plate into position.

3. Install a new steering line clamp plate bolt.
    - Tighten to 10 Nm (89 lb-in).

4. Install the power steering line retainer bracket bolt.
    - Tighten to 10 Nm (89 lb-in).

5. Using the special tool, install a new Teflon® seal on the pressure line fitting.



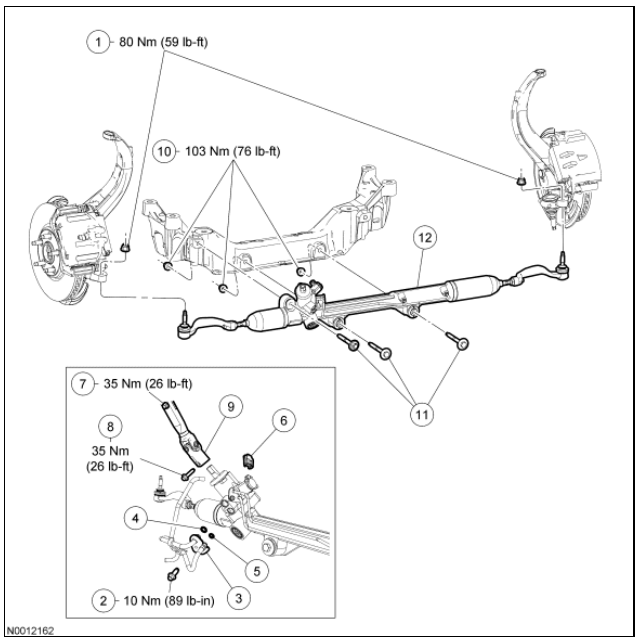
6. Install the pressure line fitting.
    - Tighten to 33 Nm (24 lb-ft).

7. Connect the PSP switch electrical connector.

8. Fill the power steering system. For additional information, refer to Section 211-00 .

Steering Gear

Printable View (150 KB)



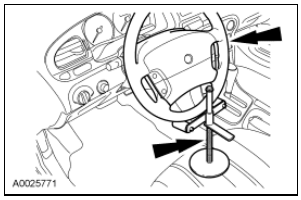
Item	Part Number	Description
1	W520214-S427	Tie-rod end nuts (2 required)
2	W708113-S426	Steering line clamp plate bolt
3	3A713	Steering lines (pressure/return)
4	3F886-AA	O-ring (pressure line)
5	N803257-S	O-ring (return line)
6	12B637	Variable assist power steering (VAPS) actuator electrical connector
7		Intermediate shaft slider bolt
8	W705113-S426	Intermediate shaft-to-steering gear bolt
9	3B676	Intermediate shaft
10	W520214-S427	Steering gear-to-crossmember nuts (3 required)
11	W708659-S426	Steering gear-to-crossmember bolts (3 required)
12	3504	Steering gear

Removal and Installation

⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. **⚠ CAUTION: Do not allow the steering wheel to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

   Hold the steering wheel in the straight-ahead position using a suitable holding device.



2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the 2 tie-rod end nuts and separate the 2 tie-rod ends from the wheel knuckles.
    - To install, tighten to 80 Nm (59 lb-ft).

4. Remove and discard the steering line clamp plate bolt and disconnect the steering lines from the steering gear.
    - To install, tighten to 10 Nm (89 lb-in).

5. Remove and discard the 2 O-ring seals.

6. Disconnect the VAPS actuator electrical connector.

7. Loosen the intermediate shaft slider bolt.
    - To install, tighten to 35 Nm (26 lb-ft).

8. Remove and discard the intermediate shaft-to-steering gear bolt and disconnect the intermediate shaft from the steering gear.
    - To install, tighten to 35 Nm (26 lb-ft).

9. Remove the 3 steering gear-to-crossmember nuts and bolts.
    - To install, tighten to 103 Nm (76 lb-ft).

10. Remove the steering gear.

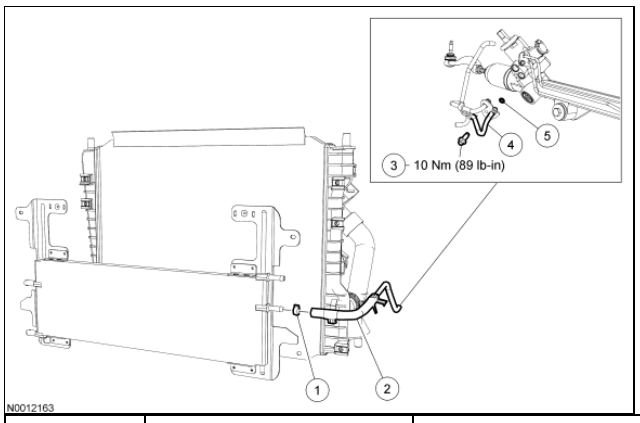
11. To install, reverse the removal procedure.
    - Fill the power steering system. For additional information, refer to Section 211-00 .

Steering Gear to Fluid Cooler Return Hose

Printable View (100 KB)

Special Tool(s)

 ST1301-A	Installer, Constant Velocity Boot Clamp 205-343 (T95P-3514-A)



Item	Part Number	Description
1	3C750	Steering gear-to-cooler hose clamp
2	3A713	Steering gear-to-cooler hose
3	W708113-S426	Steering line clamp plate bolt
4	3A713	Steering gear-to-cooler line
5	N803257-S	O-ring seal

Removal

⚠ CAUTION: While repairing the power steering system, care should be taken to prevent the entry of contaminants or premature failure of the power steering components can result.

1. Remove the air conditioning condenser. For additional information, refer to Section 412-03 .
2. Remove and discard the steering gear-to-cooler hose clamp.
3. Remove the steering gear-to-cooler hose.
   - Allow the fluid to drain into a suitable container.
4. Remove and discard the steering line clamp plate bolt.
5. Rotate the steering line clamp plate and remove the steering gear-to-cooler line.
6. Remove and discard the O-ring seal.

Installation

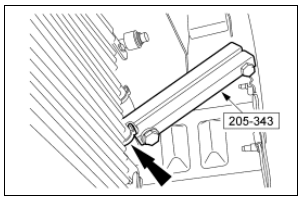
1. Install a new O-ring seal on the steering gear-to-cooler line.

2. Position the steering gear-to-cooler line to the steering gear.

3. Rotate the steering line clamp plate into position and install a new bolt.
   - Tighten to 10 Nm (89 lb-in).

4. Install a new steering gear-to-cooler hose clamp and connect the hose.

5. Using the special tool, tighten the steering gear-to-cooler hose clamp.



6. Fill the power steering system. For additional information, refer to Section 211-00 .

Printable View (8 KB)

Torque Specifications

Description	Nm	lb-ft	lb-in
Column release motor screws	4		35
Horn switch pad bolts	6		53
Intermediate shaft bearing plate nuts	9		80
Intermediate shaft slider bolt	35	26	
Intermediate shaft-to-steering gear bolt	35	26	
Rotation sensor screws	0.9		8

Steering Column

Printable View (149 KB)

Refer to Wiring Diagrams Cell 128 for schematic and connector information.

Special Tool(s)

ST1137-A	73III Automotive Multimeter 105-R0057 or equivalent
ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool
ST2574-A	Flex Probe Kit 105-R025B

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

   Visual Inspection Chart

Mechanical	Electrical
• Steering column	• Battery junction box (BJB) fuse 19 (15A) • Tilt/telescope switch • Circuitry • Electrical connectors

3. If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. If the concern remains after the inspection, connect diagnostic tool to the data link connector (DLC) located beneath the instrument panel to carry out diagnostic tool data link test. Refer to Section 418-00 . If the self-test is passed for the instrument cluster, retrieve the continuous diagnostic trouble codes (DTCs).
5. If diagnostic trouble codes (DTCs) are retrieved, go to the Instrument Cluster Diagnostic Trouble Code (DTC) Index to continue diagnostics.
6. If the self-test is passed and no DTCs are retrieved, GO to Symptom Chart .

7. If the instrument cluster cannot be accessed by the diagnostic tool, refer to the instrument cluster diagnostics for further instructions. Refer to Section 413-01 .

Instrument Cluster Diagnostic Trouble Code (DTC) Index

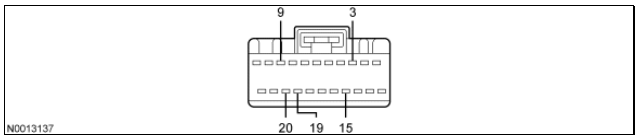
DTC	Description	Source	Action
B1342	ECU is Defective	Instrument Cluster	CLEAR the DTC. REPEAT the self-test. If other DTCs are retrieved, repair those and REPEAT the self-test. If DTC B1342 is retrieved again, INSTALL a new instrument cluster. REFER to Section 413-01 .
B2328	Steering Column Reach (Telescopic) Feedback Potentiometer Circuit Failure	Instrument Cluster	Go To Pinpoint Test A .
B2332	Steering Column Tilt Feedback Potentiometer Circuit Failure	Instrument Cluster	Go To Pinpoint Test B .
B2351	Steering Column Switch Signal Circuit Failure	Instrument Cluster	Go To Pinpoint Test C .

Symptom Chart

Symptom Chart

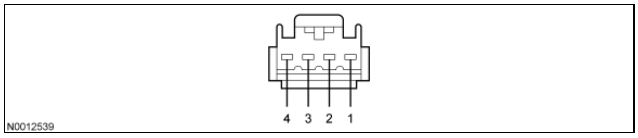
Connector Circuit Reference

Instrument Cluster C220c



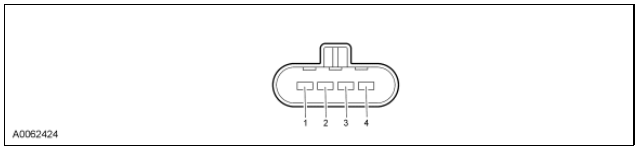
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	9-AL10 (BN) tilt/telescope switch input signal from the instrument cluster	Voltage varies with switch actuation, 0 volts with the switch in the neutral position.
9	9-AL17 (BN/WH) steering column position sensor input from the instrument cluster	5 volt reference with the ignition switch in the ACC and the RUN positions.
15	8-AL10 (WH) tilt/telescope switch input signal to the instrument cluster	5 volt reference with the ignition switch in the ACC and the RUN positions.
19	7-AL17 (YE/VT) steering column position sensor signal ground from the instrument cluster	0 volts, less than 5 ohms resistance to ground.
20	8-AL17 (WH/VT) steering column position sensor signal	Voltage varies with the tilt motor position.

Steering Column Position Sensor C222



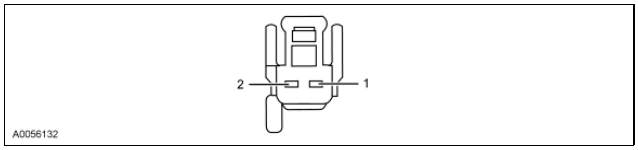
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	8-AL16 (WH/BK) steering column position sensor signal	Voltage varies with the telescope motor position.
2	7-AL17 (YE/VT) steering column position sensor signal ground from the instrument cluster	0 volts, less than 5 ohms resistance to ground.
3	8-AL17 (WH/VT) steering column position sensor signal	Voltage varies with the tilt motor position.
4	9-AL17 (BN/WH) steering column position sensor input from the instrument cluster	5 volt reference with the ignition switch in the ACC and the RUN positions.

Tilt/Telescope Motor C227



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	33-AL6 (YE/BU) tilt motor power	10 to 12 volts upon the tilt/telescope switch actuation or memory position recall with the ignition switch in the ACC and the RUN positions.
2	32-AL6 (WH/BU) tilt motor ground	0 volts, less than 5 ohms to ground.
3	35-AL7 (VT/BK) telescope motor ground	0 volts, less than 5 ohms to ground.
4	34-AL7 (BU/BK) telescope motor power	10 to 12 volts upon the tilt/telescope switch actuation or memory position recall with the ignition switch in the ACC and the RUN positions.

Tilt/Telescope Switch C2250



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement

1	9-AL10 (BN) tilt/telescope switch input signal to the instrument cluster	5 volt reference with the ignition switch in the ACC and the RUN positions.
2	8-AL10 (WH) tilt/telescope switch input signal from the instrument cluster	Voltage varies with the switch actuation, 0 volts with the switch in the neutral position.

Pinpoint Tests

Pinpoint Test A: DTC B2328: Steering Column Reach (Telescopic) Feedback Potentiometer Circuit Failure

Normal Operation

The steering column telescopic motor receives information from the steering column position sensor when a memory position is requested. The steering column position sensor sends the telescopic motor position information to the instrument cluster where it is stored and is used when several adjustable features are requested. The steering column position sensor sends the steering column telescopic position to the instrument cluster through circuit 8-AL16 (WH/BK).

Possible Causes

- circuit 8-AL16 (WH/BK) short to voltage, short to ground, or open
- steering column position sensor
- steering column mechanical component
- instrument cluster

PINPOINT TEST A: DTC B2328 STEERING COLUMN REACH (TELESCOPIC) FEEDBACK POTENTIOMETER CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
A1 CHECK FOR CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCS)	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Continuous DTCs. • **Is DTC B2328 present?**	**Yes** GO to A7 . **No** GO to A2 .
A2 CHECK FOR MECHANICAL FAULTS	
• Disconnect and reconnect the battery. • Enter the following diagnostic mode on the diagnostic tool: Clear Instrument Cluster DTCs. • Actuate the steering column to the full IN position. • Actuate the steering column to the full OUT position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Is DTC B2328 present?**	**Yes** GO to A3 . **No** The system was deactivated due to the instrument cluster registering an excessive number of motion faults. NOTIFY the owner that the concern has been corrected.

A3 CHECK THE STEERING COLUMN BEARINGS	
• Remove the steering column shrouds. • Make sure the steering column bearings are fully seated back against the stops. • **Are the steering column bearings correctly seated back against the stops?**	**Yes** GO to A4 . **No** INSTALL a new steering column. REFER to Steering Column in this section. CLEAR the DTCs. REPEAT the self-test.
A4 ISOLATE THE STEERING COLUMN POSITION SENSOR	
• Disconnect: Steering Column Position Sensor C222. • Connect a jumper wire between the steering column position sensor C222-4, circuit 9-AL17 (BN/WH), harness side and the steering column position sensor terminal 1.  AG0154-A • Connect a jumper wire between the steering column position sensor C222-2, circuit 7-AL17 (YE/VT), harness side and the steering column position sensor terminal 4. • Connect a jumper wire between the steering column position sensor C222-3, circuit 8-AL17 (WH/VT) and the steering column position sensor terminal 3. • Connect a jumper wire between the steering column position sensor C222-1, circuit 8-AL16 (WH/BK) and the steering column position sensor terminal 2. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Is DTC B2328 retrieved?**	**Yes** INSTALL a new steering column. REFER to Steering Column in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to A5 .
A5 CHECK FOR STEERING COLUMN MOVEMENT	
NOTE: This active command will only power the motors for 1 second. • Enter the following diagnostic mode on the diagnostic tool: Tilt Motor UP Command. • Enter the following diagnostic mode on the diagnostic tool: Tilt Motor DOWN Command. • **Does the steering column tilt up and down?**	**Yes** GO to A7 . **No** GO to A6 .
A6 ISOLATE THE TILT/TELESCOPE MOTOR	
• Disconnect: Tilt/Telescope Motor C227. • Connect a voltmeter between the tilt/telescope motor C227-3, circuit 35-AL7 (VT/BK), harness side and the tilt/telescope motor C227-4, circuit 34-AL7 (BU/BK), harness side.	**Yes** INSTALL a new telescope motor. REFER to Steering Column in this section. CLEAR the DTCs. REPEAT the self-test.

 • Enter the following diagnostic mode on the diagnostic tool: Telescope Motor IN Command. • Enter the following diagnostic mode on the diagnostic tool: Telescope Motor OUT Command. • Measure the voltage while triggering the active commands. • **Is voltage present for one second after each command is sent?**	**No** GO to A7 .
A7 CHECK CIRCUIT 8-AL17 (WH/VT) FOR A SHORT TO VOLTAGE	
• Disconnect: Instrument Cluster C220c. • Measure the voltage at the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side.  • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to A8 .
A8 CHECK CIRCUIT 8-AL17 (WH/VT) FOR A SHORT TO GROUND	
• Measure the resistance between the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to A9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
A9 CHECK CIRCUIT 8-AL17 (WH/VT) FOR AN OPEN	
• Measure the resistance between the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side and steering column position sensor C222-3, circuit 8-AL17 (WH/VT), harness side. • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new instrument cluster. REFER to Section 413-01 . REPEAT the self-test. **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test B: DTC B2332: Steering Column Tilt Feedback Potentiometer Circuit Failure

Normal Operation

The steering column tilt motor receives information from the steering column position sensor when a memory position is requested. The steering column position sensor sends the tilt motor position information to the instrument cluster where it is stored and is used when several adjustable features are requested. The steering column position sensor sends the steering column tilt position to the instrument cluster through circuit 8-AL17 (WH/VT), and circuit 33-AL6 (YE/BU) powers the tilt motor.

Possible Causes

- circuit 8-AL17 (WH/VT) short to voltage, short to ground, or open
- steering column position sensor
- steering column mechanical component
- instrument cluster

PINPOINT TEST B: DTC B2332 STEERING COLUMN TILT FEEDBACK POTENTIOMETER CIRCUIT FAILURE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
B1 CHECK FOR CONTINUOUS DIAGNOSTIC TROUBLE CODES (DTCs)	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Continuous DTCs . • **Is DTC B2332 present?**	**Yes** GO to B7 . **No** GO to B2 .
B2 CHECK FOR MECHANICAL FAULTS	
• Disconnect and reconnect the battery. • Enter the following diagnostic mode on the diagnostic tool: Clear Instrument Cluster DTCs. • Actuate the steering column to the full in position. • Actuate the steering column to the full out position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Is DTC B2332 present?**	**Yes** GO to B3 . **No** The system was deactivated due to the instrument cluster registering an excessive number of motion faults. NOTIFY the owner that concern has been corrected.
B3 CHECK THE STEERING COLUMN BEARINGS	
• Remove the steering column shrouds. • Make sure the steering column bearings are fully seated back against the stops. • **Are the steering column bearings correctly seated back against the stops?**	**Yes** GO to B4 . **No** INSTALL a new steering column. REFER to Steering Column in this section. CLEAR the DTCs. REPEAT the self-test.
B4 ISOLATE THE STEERING COLUMN POSITION SENSOR	

• Disconnect: Steering Column Position Sensor C222. • Connect a jumper wire between the steering column position sensor C222-4, circuit 9-AL17 (BN/WH), harness side and the steering column position sensor terminal 1.  AG0154-A • Connect a jumper wire between the steering column position sensor C222-2, circuit 7-AL17 (YE/VT), harness side and the steering column position sensor terminal 4. • Connect a jumper wire between the steering column position sensor C222-3, circuit 8-AL17 (WH/VT) and the steering column position sensor terminal 3. • Connect a jumper wire between the steering column position sensor C222-1, circuit 8-AL16 (WH/BK) and the steering column position sensor terminal 2. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Self-Test. • **Is DTC B2332 retrieved?**	**Yes** INSTALL a new steering column. REFER to Steering Column in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to B5 .
B5 CHECK FOR STEERING COLUMN MOVEMENT	
NOTE: This active command will power the motors for only 1 second. • Enter the following diagnostic mode on the diagnostic tool: Tilt Motor UP Command. • Enter the following diagnostic mode on the diagnostic tool: Tilt Motor DOWN Command. • **Does the steering column tilt up and down?**	**Yes** INSTALL a new steering column. REFER to Steering Column in this section. Clear the DTC. REPEAT the self-test. **No** GO to B6 .
B6 ISOLATE THE TILT/TELESCOPE MOTOR	
• Disconnect: Tilt/Telescope Motor C227. • Connect a voltmeter between the tilt/telescope motor C227-2, circuit 32-AL6 (WH/BU), harness side and the tilt/telescope motor C227-1, circuit 33-AL6 (YE/BU), harness side.  A0005886 • Enter the following diagnostic mode on the diagnostic tool: Tilt Motor UP Command.	**Yes** INSTALL a new tilt motor. REFER to Steering Column in this section. CLEAR the DTCs. REPEAT the self-test. **No** GO to B7 .

• Enter the following diagnostic mode on the diagnostic tool: Tilt Motor DOWN Command. • Measure the voltage while triggering the active commands. • **Is voltage present for one second after each command is sent?**	
B7 CHECK CIRCUIT 8-AL17 (WH/VT) FOR A SHORT TO VOLTAGE	
• Disconnect: Instrument Cluster C220c. • Measure the voltage at instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side and ground.  • **Is voltage present?**	**Yes** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test. **No** GO to B8 .
B8 CHECK CIRCUIT 8-AL17 (WH/VT) FOR A SHORT TO GROUND	
• Measure the resistance between the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to B9 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B9 CHECK CIRCUIT 8-AL17 (WH/VT) FOR AN OPEN	
• Measure the resistance between the instrument cluster C220c-20, circuit 8-AL17 (WH/VT), harness side and steering column position sensor C222-3, circuit 8-AL17 (WH/VT), harness side. • **Is the resistance less than 5 ohms?**	**Yes** GO to B10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
B10 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this

• Operate the system and verify the concern is still present. • **Is the concern still present?**	time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Pinpoint Test C: The Tilt And Telescopic Adjustments Are Inoperative

Normal Operation

The tilt/telescope switch is hardwired to the instrument cluster. Depending on the direction of the switch (UP/DOWN/IN/OUT) a signal is sent to the instrument cluster to activate the tilt or telescope motor. The steering column telescopic motor receives information from the steering column position sensor when a memory position is requested. The steering column position sensor sends the telescopic motor position information to the instrument cluster where it is stored and is used when several adjustable features are requested. The steering column position sensor sends the steering column telescopic position to the instrument cluster through circuit 8-AL16 (WH/BK).

Possible Causes

- circuit 9-AL17 (BN/WH) short to voltage, short to ground, or open
- circuit 7-AL17 (YE/VT) short to voltage, short to ground, or open
- circuit 8-AL10 (WH) short to voltage, short to ground, or open
- circuit 9-AL10 (BN) short to voltage, short to ground, or open
- steering column
- instrument cluster
- tilt/telescope switch

PINPOINT TEST C: THE TILT AND TELESCOPE ADJUSTMENT ARE INOPERATIVE

Test Step	Result / Action to Take
C1 CHECK CONTINUOUS DTCS	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Continuous DTCs. • **Are DTCs B2328 or B2332 present?**	**Yes** If DTC B2328 was retrieved, Go To Pinpoint Test A . If DTC B2332 was retrieved, Go To Pinpoint Test B . **No** GO to C2 .
C2 CHECK THE INSTRUMENT CLUSTER PIDS	
• Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Tilt PID and Telescope PID. • Actuate the tilt/telescope switch to the tilt up, tilt down, telescope in, telescope out and neutral positions. • **Do the PIDS correspond correctly with all the switch positions?**	**Yes** If DTC B2351 was previously retrieved, CLEAR the DTCs. REPEAT the self-test. If DTC B2351 is retrieved again, GO to C13 . If no DTCs were previously retrieved, GO to C7 . **No** GO to C3 .

C3 CHECK THE TILT/TELESCOPE SWITCH FOR CORRECT OPERATION	
• Key in OFF position. • Disconnect: Tilt/Telescope Switch C2250. • Carry out the tilt/telescope switch component test. Refer to Wiring Diagrams Section 700-09 for schematic and connector information. • **Is the tilt/telescope switch OK?**	**Yes** GO to C4 . **No** INSTALL a new tilt/telescope switch. REFER to Section 211-05 . REPEAT the self-test. CLEAR the DTCs.
C4 CHECK CIRCUITS 8-AL10 (WH) AND 9-AL10 (BN) FOR A SHORT TO VOLTAGE	
• Disconnect: Instrument Cluster C220c. • Key in ON position. • Measure the voltage between the tilt/telescope switch C2250-1, circuit 9-AL10 (BN), harness side and ground; and between the tilt/telescope switch C2250-2, circuit 8-AL10 (WH), harness side and ground.  N0002973 • **Is any voltage present?**	**Yes** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test. **No** GO to C5 .
C5 CHECK CIRCUITS 8-AL10 (WH) AND 9-AL10 (BN) FOR A SHORT TO GROUND	
• Key in OFF position. • Measure the resistance between the tilt/telescope switch C2250-1, circuit 9-AL10 (BN), harness side and ground; and between the tilt/telescope switch C2250-2, circuit 8-AL10 (WH), harness side and ground.  N0002974 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to C6 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.
C6 CHECK CIRCUITS 8-AL10 (WH) AND 9-AL10 (BN) FOR AN OPEN	
• Measure the resistance between the tilt/telescope switch C2250-1, circuit 9-AL10 (BN), harness side and the instrument cluster C220c-3 circuit 9-AL10 (BN), harness side; and between the tilt/telescope switch C2250-2, circuit 8-AL10 (WH), harness side and instrument cluster C220c-15 circuit 8-AL10 (WH), harness side.	**Yes** GO to C7 . **No** REPAIR the circuit in question. CLEAR the DTCs. REPEAT the self-test.

 N0002975 • **Are the resistances less than 5 ohms?**	
C7 CHECK CIRCUIT 9-AL17 (BN/WH) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the instrument cluster C220c-9, circuit 9-AL17 (BN/WH), harness side and ground.  A0000430 • **Is any voltage present?**	**Yes** GO to C8 . **No** GO to C9 .
C8 CHECK CIRCUIT 7-AL17 (YE/VT) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Steering Column Position Sensor C222. • Key in ON position. • Measure the voltage between the instrument cluster C220c-19, circuit 7-AL17 (YE/VT), harness side and ground.  A0000431 • **Is any voltage present?**	**Yes** REPAIR circuit 7-AL17 (YE/VT). CLEAR the DTCs. REPEAT the self-test. **No** REPAIR circuit 9-AL17 (BN/WH). CLEAR the DTCs. REPEAT the self-test.
C9 CHECK CIRCUIT 9-AL17 (BN/WH) FOR A SHORT TO GROUND OR AN OPEN	
• Key in OFF position. • Disconnect: Steering Column Position Sensor C222. • Measure the resistance between the instrument cluster C220c-9, circuit 9-AL17 (BN/WH), harness side and the steering column position sensor C222-4, circuit 9-AL17 (BN/WH), harness side; and between the instrument cluster C220c-9, circuit 9-AL17 (BN/WH), harness side and ground.	**Yes** GO to C10 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.

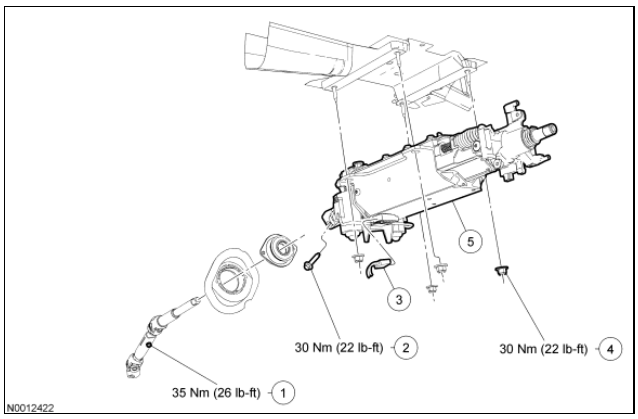
 N0013101 • **Is the resistance less than 5 ohms between the instrument cluster and the steering column position sensor and greater than 10,000 ohms between the instrument cluster and ground?**	
C10 CHECK FOR MOTOR MOTION SENSED	
• Connect: Instrument Cluster C220c. • Connect: Steering Column Position Sensor C222. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Steering Column Control Active Command. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Telescope Position PID and Tilt Position PID. • **NOTE:** This active command will only power the motors for one second. • Trigger tilt UP, tilt DOWN, telescope IN and telescope OUT on, one at a time while monitoring the telescope position PID and the tilt position PID. • **Do the telescope position and tilt position PIDs read SENSED when the corresponding motors are triggered on?**	**Yes** INSPECT the steering column position sensor and the instrument cluster connectors for loose or intermittent connections. CLEAR the DTCs. REPEAT the self-test. **No** GO to C11 .
C11 ISOLATE THE STEERING COLUMN POSITION SENSOR	
• Connect: Instrument Cluster C220c. • Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: Instrument Cluster Steering Column Control Active Command. • Enter the following diagnostic mode on the diagnostic tool: Trigger Telescope IN On. • Measure the voltage between the steering column position sensor C222-2, circuit 7-AL17 (YE/VT), harness side and ground during the active command.  N0013102 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new steering column position sensor. CLEAR the DTCs. REPEAT the self-test. **No** GO to C12 .
C12 CHECK CIRCUIT 7-AL17 (YE/VT) FOR A SHORT TO GROUND OR AN OPEN	

• Key in OFF position. • Disconnect: Instrument Cluster C220c. • Measure the resistance between the instrument cluster C220c-19, circuit 7-AL17 (YE/VT), harness side and the steering column position sensor C222-2, circuit 7-AL17 (YE/VT), harness side; and between the instrument cluster C220c-19, circuit 7-AL17 (YE/VT), harness side and ground.  • **Is the resistance greater than 10,000 ohms between the instrument cluster and ground and less than 5 ohms between the instrument cluster and the steering column position sensor?**	**Yes** GO to C13 . **No** REPAIR the circuit. CLEAR the DTCs. REPEAT the self-test.
C13 CHECK FOR CORRECT INSTRUMENT CLUSTER OPERATION	

• Disconnect all the instrument cluster connectors.
• Check for:
  • corrosion
  • pushed-out pins
• Connect all the instrument cluster connectors and make sure they seat correctly.
• Operate the system and verify the concern is still present.
• **Is the concern still present?**
	Yes
	INSTALL a new instrument cluster. REFER to Section 413-01 . CLEAR the DTCs. REPEAT the self-test.
	
	No
	The system is operating correctly at this time. The concern may have been caused by a loose or corroded connector. CLEAR the DTCs. REPEAT the self-test.

Steering Column

Printable View (70 KB)



Item	Part Number	Description
1	3B676	Intermediate shaft slider bolt
2	W705113-S436	Steering column-to-intermediate shaft bolt
3		Electrical connector (part of 14401)
4	N806423-S424	Steering column-to-instrument panel nuts (4 required)
5	3C529	Steering column

Removal and Installation

⚠ **CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .**

1. Depower the supplemental restraint system (SRS). For additional information, refer to Section 501-20B .

2. Remove the steering column opening reinforcement panel and the reinforcement. For additional information, refer to Section 501-12 .

3. Remove the multifunction switch. For additional information, refer to Section 211-05 .

4. Remove the steering wheel. For additional information, refer to Steering Wheel in this section.

5. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

6. Remove the intermediate shaft slider bolt.
   - To install, tighten to 35 Nm (26 lb-ft).

7. **NOTE:** Install a new steering column-to-intermediate shaft bolt.

   Remove and discard the steering column-to-intermediate shaft bolt.

   - To install, tighten to 30 Nm (22 lb-ft).

8. Disconnect the electrical connector.

9. **NOTE:** Install 4 new steering column-to-instrument panel nuts.

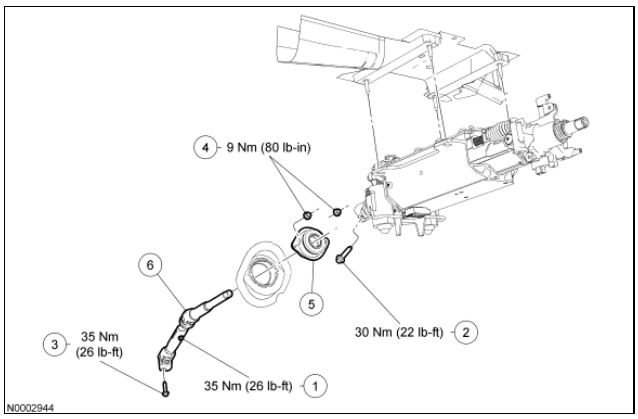
   Remove and discard the 4 steering column-to-instrument panel nuts and the steering column.

   - To install, tighten to 30 Nm (22 lb-ft).

10. To install, reverse the removal procedure.
    - Repower the supplemental restraint system (SRS). For additional information, Refer to Section 501-20B .

Steering Column Shaft

Printable View (68 KB)



Item	Part Number	Description
1	3B676	Intermediate shaft slider bolt
2	W705113-S436	Steering column-to-intermediate shaft bolt
3	W705113-S436	Intermediate shaft-to-steering gear bolt
4	N806385-S58	Intermediate shaft bearing plate nuts (2 required)
5	3E735	Intermediate shaft bearing plate
6	3C662	Intermediate shaft

Removal and Installation

⚠ CAUTION: Do not allow the steering column shaft to rotate while the intermediate shaft is disconnected or damage to the clockspring can result. If there is evidence that the shaft has rotated, the clockspring must be removed and recentered. For additional information, refer to Section 501-20B .

1. Depower the supplemental restraint system (SRS). For additional information, Refer to Section 501-20B .

2. With the vehicle in NEUTRAL, position it on a hoist. For additional information, refer to Section 100-02 .

3. Remove the intermediate shaft slider bolt.
   - To install, tighten to 35 Nm (26 lb-ft).

4. **NOTE:** Install a new steering column-to-intermediate shaft bolt.

   Remove and discard the steering column-to-intermediate shaft bolt.

   - To install, tighten to 30 Nm (22 lb-ft).

5. **NOTE:** Install a new intermediate shaft-to-steering gear bolt.

   Remove and discard the intermediate shaft-to-steering gear bolt.

   - To install, tighten to 35 Nm (26 lb-ft).

6. **NOTE:** Install 2 new intermediate shaft bearing plate nuts.

Remove and discard the 2 intermediate shaft bearing plate nuts and the plate.

- To install, tighten to 9 Nm (80 lb-in).

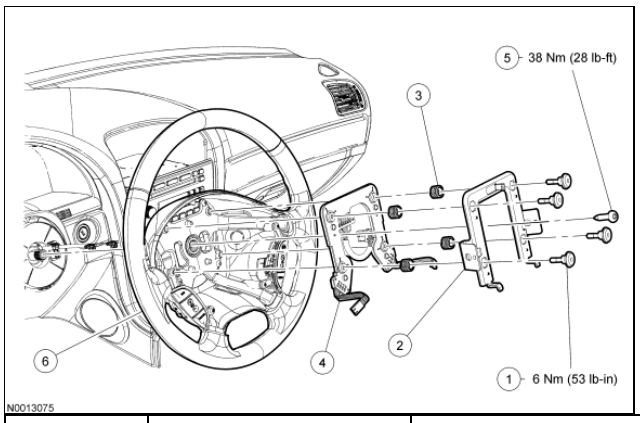
7. Remove the intermediate shaft.
8. To install, reverse the removal procedure.

Steering Wheel

Printable View (164 KB)

Special Tool(s)

 ST1321-A	Remover, Differential Bearing 205-116 (T77F-4220-B1)



Item	Part Number	Description
1	13A875	Horn switch pad bolts (4 required)
2	13A875	Horn switch pad
3	13A875	Horn switch springs (4 required)
4	13A875	Horn switch
5	N807493-S301	Steering wheel bolt
6	3600	Steering wheel

Removal and Installation

1. Remove the driver air bag module. For additional information, Refer to Section 501-20B .

2. **NOTE:** When installing the horn switch springs, to provide correct tension between the horn pad and the horn switch, install the yellow horn switch springs at the bottom of the horn switch pad and the silver springs at the top.

   Remove the 4 horn switch pad bolts, horn switch pad and horn switch springs.

   - To install, tighten to 6 Nm (53 lb-in).

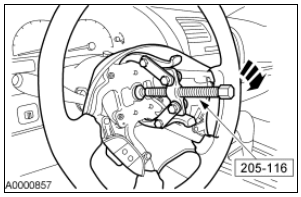
3. Remove the horn switch.

4. **NOTE:** Do not remove the steering wheel bolt until the steering wheel has been separated from the column.

   Loosen the steering wheel bolt.

   - To install, tighten to 38 Nm (28 lb-ft).

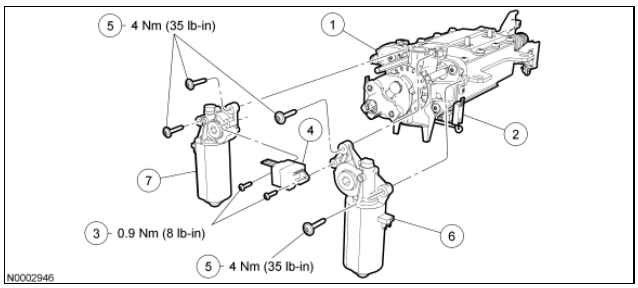
5. Using the special tool, separate the steering wheel from the steering column shaft.
    - Remove and discard the steering wheel bolt.
    - Remove the steering wheel.



6. To install, reverse the removal procedure.
    - Install the driver air bag module. For additional information, refer to Section 501-20B .

Tilt/Telescopic Motors

Printable View (63 KB)



Item	Part Number	Description
1	3C529	Steering column
2	3C529	Release motor electrical connectors
3	390345-S36	Rotation sensor screws (2 required)
4	3F818	Rotation sensor
5	W701912-S436	Column release motor screws (4 required)
6	3D538H	Column release motor (telescopic)
7	3D538G	Column release motor (tilt)

Removal and Installation

1. Remove the steering column. For additional information, refer to Steering Column in this section.

2. Disconnect the 2 column release motor electrical connectors.

3. Remove the 2 rotation sensor screws and the rotation sensor.
   - To install, tighten to 0.9 Nm (8 lb-in).

4. Remove the 4 screws and the column release motors.
   - To install, tighten to 4 Nm (35 lb-in).

5. To install, reverse the removal procedure.

Steering Column Switches

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool
ST1137-A	73III Automotive Meter 105-R0057 or equivalent
ST2574-A	Flex Probe Kit 105-R025B

Refer to Wiring Diagrams Cell 13 for schematic and connector information.

Refer to Wiring Diagrams Cell 90 for schematic and connector information.

Refer to Wiring Diagrams Cell 81 for schematic and connector information.

Refer to Wiring Diagrams Cell 128 for schematic and connector information.

Inspection and Verification

1. Verify the customer concern.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Multifunction switch • Ignition key • Ignition switch • Tilt/telescope switch	• Circuitry • Rear battery junction box (RBJB) fuse 22 (20A) • Central junction box (CJB) fuse(s): ♦ 4 (5A) ♦ 13 (5A) ♦ 17 (5A)

NOTE: For multifunction switch concerns, refer to one of the following sections:

- Exterior Lighting, Section 417-01 .
- Wipers and Washers, Section 501-16 .

3. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If diagnostic tool does not communicate with the vehicle:
    - check that the program card is correctly installed.
    - check the connections to the vehicle.
    - check the ignition switch position.

4. Carry out the diagnostic tool data link test. If the diagnostic tool responds with:
    - CAN, SCP or ISO circuit fault; all electronic control units no response/not equipped, refer to Section 418-00 .
    - No response/not equipped for the front electronic module (FEM), refer to Section 419-10 .
    - No response/not equipped for the instrument cluster module (ICM), refer to Section 413-01 .

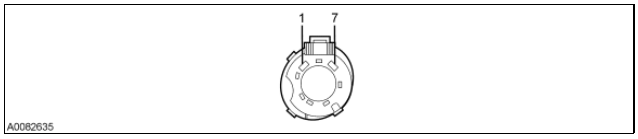
5. If DTCs are present, refer to Section 419-10 for FEM-related DTCs, or Section 413-01 for ICM-related DTCs.

6. If no DTCs are present, GO to Symptom Chart to continue diagnostics.

Symptom Chart

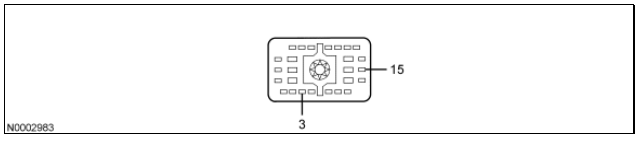
Symptom Chart
Connector Circuit Reference

Ignition Switch C250



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	30-BB9 (RD) ignition switch supply voltage	B+ voltage at all times (not overload protected).
7	30-BB20 (RD) ignition START, RUN and key-in-switch voltage	B+ voltage at all times.

Central Junction Box (CJB) C270a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
3	50-DD5 (GY/BK) ignition START and RUN voltage	B+ voltage with the ignition switch in the START and RUN positions.
15	75-DD1 (YE) ignition accessory (ACC) and RUN voltage from ignition switch	B+ voltage with the ignition switch in the RUN and ACC positions.

Pinpoint Tests

Pinpoint Test A: The Ignition Switch Is Inoperative

Normal Operation

The ignition switch receives overload protected battery voltage from the rear battery junction box (RBJB) fuse 22 (20A) through circuit 30-DA5 (RD/BK). The ignition switch has 4 possible states:

- OFF
- ACC
- RUN
- START

Possible Causes

- circuit 30-DA5 (RD/BK) open
- circuit 30-BB20 (RD) open
- circuit 30-BB9 (RD) open
- ignition switch
- instrument cluster

PINPOINT TEST A: THE IGNITION SWITCH IS INOPERATIVE

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
A1 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to A2 . **No** INSTALL a new ignition switch. TEST the system for normal operation.
A2 CHECK CIRCUITS 30-BB20 (RD) AND 30-BB9 (RD) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-7, circuit 30-BB20 (RD), harness side and ground; and between ignition switch C250-1,	**Yes** CHECK the instrument cluster for faults. REFER to Section 413-01 .

circuit 30-BB9 (RD), harness side and ground.  • **Are the voltages greater than 10 volts?**	**No** REPAIR the affected circuit(s). TEST the system for normal operation.

Pinpoint Test B: No Power in ACC

Normal Operation

The ignition switch receives overload protected B+ voltage from the rear battery junction box (RBJB) fuse 22 (20A) through circuit 30-DA5 (RD/BK). The ignition switch has 4 possible states:

- OFF
- ACC
- RUN
- START

Possible Causes

- circuit 75-DD1 (YE) open
- circuit 30-BB20 (RD) open
- central junction box (CJB) fuse 13 (5A)
- ignition switch
- instrument cluster

PINPOINT TEST B: NO POWER IN ACC

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
B1 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to B2 . **No** INSTALL a new ignition switch. TEST the system for normal operation.
B2 CHECK CIRCUIT 30-BB20 (RD) FOR VOLTAGE	
• Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-7, circuit 30-BB20 (RD), harness side and ground.	**Yes** GO to B3 . **No** REPAIR the circuit(s) in question. TEST the system for normal operation.

 N0002984 • **Is the voltage greater than 10 volts?**	
B3 CHECK CIRCUIT 75-DD1 (YE)	
• Key in OFF position. • Disconnect: BJB C270a. • Key in ON position. • Measure the voltage between the CJB C270a-15, circuit 75-DD1 (YE), harness side and ground.  A0001613 • **Is the voltage greater than 10 volts?**	**Yes** GO to B4 . **No** REPAIR the circuit. TEST the system for normal operation.
B4 CHECK THE CENTRAL JUNCTION BOX (CJB) FUSE 13 (5A)	
• CHECK the CJB fuse 13 (5A). • **Is the fuse OK?**	**Yes** CHECK the instrument cluster for faults. REFER to Section 413-01 . **No** INSTALL a new fuse. TEST the system for normal operation.

Pinpoint Test C: No Power In START/RUN

Normal Operation

The ignition switch receives overload protected battery voltage from the battery junction box (BJB) fuse 22 (20A) through circuit 30-DA5 (RD/BK). The ignition switch has 4 possible states:

- OFF
- ACC
- RUN
- START

Possible Causes

- circuit 30-DA5 (RD/BK) open
- CJB fuse 17 (5A)
- ignition switch
- instrument cluster

PINPOINT TEST C: NO POWER IN START/RUN

⚠ CAUTION: Use the Flex Probe Kit for all test connections to prevent damage to the wiring terminals. Do not use standard multimeter probes.

Test Step	Result / Action to Take
C1 CHECK THE IGNITION SWITCH	
• Carry out the Ignition Switch Component Test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the ignition switch OK?**	**Yes** GO to C2 . **No** INSTALL a new ignition switch. TEST the system for normal operation.
C2 CHECK CIRCUIT 30-BB20 (RD) FOR VOLTAGE	
• Disconnect: Ignition Switch C250. • Measure the voltage between ignition switch C250-7, circuit 30-BB20 (RD), harness side and ground.  N0002984 • **Is the voltage greater than 10 volts?**	**Yes** GO to C3 . **No** REPAIR the affected circuit(s). TEST the system for normal operation.
C3 CHECK CIRCUIT 15-DD4 (GN/BK) FOR VOLTAGE	
• Measure the voltage between the CJB C270a-3, circuit 15-DD4 (GN/BK), harness side and ground.  N0002985 • **Is the voltage greater than 10 volts?**	**Yes** GO to C4 . **No** REPAIR the circuit. TEST the system for normal operation.
C4 CHECK CJB FUSE 17 (5A)	
• CHECK the CJB fuse 17 (5A). • **Is the fuse OK?**	**Yes** CHECK the instrument cluster for faults. REFER to Section 413-01 . **No** INSTALL a new fuse. TEST the system for normal operation.

Pinpoint Test D: The Multifunction Switch/Hazard Switch Does Not Operate Correctly

Normal Operation

The multifunction/hazard switch controls the following components:

- turn signals
- high/low beam/flash-to-pass headlamps
- wiper/washers
- hazard lamps

Possible Causes
- multifunction/hazard switch

PINPOINT TEST D: THE MULTIFUNCTION SWITCH/HAZARD SWITCH DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
D1 CHECK THE TURN SIGNAL LEVER POSITIONS	
NOTE: Prior to testing, make sure the hazard knob is pushed in fully to the OFF position. • Key in ON position. • Check the turn signal lever in the RH and LH turn positions with the steering wheel locked in the straight-ahead position. Lock the lever in position for each. • Check the lever by slightly holding it in the RH and LH turn positions. When releasing, observe that the lever springs back to normal position. • Road test the vehicle and observe the turn signals for the RH and LH turn positions while manually turning the steering wheel for each position. Verify the lever cancels when the steering returns from the desired turn position. • **Does the turn signal lever operate correctly?**	**Yes** GO to D2 . **No** If the lever will not cancel, CHECK the turn indicator cancel cam for damage. If the lever is worn or damaged, INSTALL a new multifunction switch. REFER to Steering Column Multifunction Switch in this section. TEST the system for normal operation.
D2 CHECK THE HAZARD SWITCH	
• Fully press the hazard switch and release to turn ON the hazard lamps. Verify the switch operation. • Fully press the hazard switch and release to turn OFF the hazard lamps. Verify the switch operation. • **Does the hazard switch operate correctly?**	**Yes** GO to D3 . **No** If the hazard switch is worn or damaged, INSTALL a new multifunction switch. REFER to Steering Column Multifunction Switch in this section. TEST the system for normal operation.
D3 CHECK THE HIGH BEAM AND FLASH-TO-PASS	

• Turn the headlamps ON. • Move the turn signal lever toward the instrument panel to the STOP position. Release the lever. Verify the high beams. • Move the lever back toward the seat. Release the lever. Verify the low beams. • Pull the lever toward the driver seat gently to the flash-to-pass position. Hold the position, and verify both the high and low beams illuminate. • Release the lever. Verify the low beams. • Turn the headlamps OFF. • Pull the lever to the flash-to-pass again and hold. Verify the high beams illuminate. Release the lever. Verify no high beams. • **Does the high beam, low beam and flash-to-pass operate?**	**Yes** GO to D4 . **No** If the lever is worn or damaged, INSTALL a new multifunction switch. REFER to Steering Column Multifunction Switch . TEST the system for normal operation.
D4 CHECK THE WINDSHIELD WIPER AND WASH	
• Rotate the windshield wiper switch to LOW, HIGH and intermittent positions. Verify the rotation of the switch and wiper operation. • Turn the switch to the OFF position. Verify that the switch rotates to OFF and the wipers stop operating. • Push the end of the switch in toward the center of the steering column to the WASH position. Release the wash position. Verify the wipers operate for a few cycles and return to OFF. • Operate WASH in all speeds of the wiper switch. Verify the wipers return to selected speed after releasing from the WASH position. • **Does the windshield wiper switch and WASH operate correctly?**	**Yes** CHECK the tilt/telescope switch. **No** If the switch or lever is worn or damaged, INSTALL a new wiper switch. REFER to Section 501-16 .

Component Test

Ignition Switch Mechanical Check

Test the mechanical operation of the ignition switch by rotating the lock cylinder through all switch positions. The movement should not stick or bind and should return from the START position back to the ON position without assistance (spring return). If sticking or binding is encountered, check for the following:

- burrs on the lock cylinder key.
- insufficient lube on the lock cylinder.
- excessive rubbing of the actuator against the transmission shift socket.
- binding lock cylinder.
- shroud rubbing against the lock cylinder.
- burrs or foreign material around the rack and pinion actuator in the lock cylinder housing.
- ⚠ **CAUTION: Do not apply lubricant to the inside of the ignition switch.**

insufficient lube on the actuator.
- binding ignition switch.

Ignition Switch

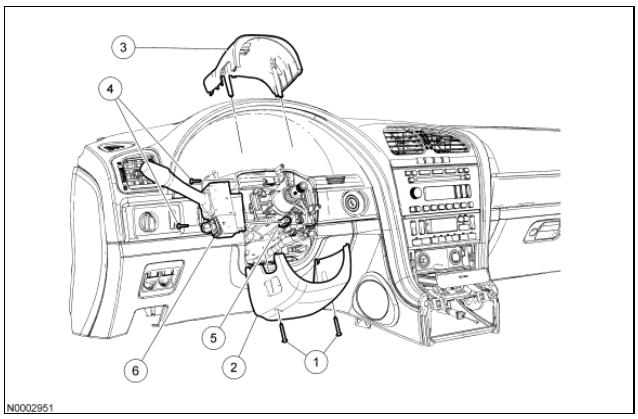
Refer to Wiring Diagrams Cell 149 for schematic and connector information.

Multifunction Switch

Refer to Wiring Diagrams Cell 149 for schematic and connector information.

Steering Column Multifunction Switch

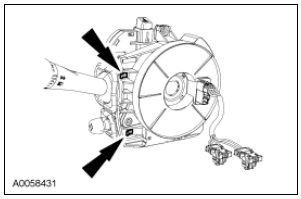
Printable View (146 KB)



Item	Part Number	Description
1	W504246-S	Lower steering column shroud screws (2 required)
2	3533	Lower steering column shroud
3	3530	Upper steering column shroud
4	W390345-S	Multifunction switch screws (2 required)
5		Electrical connector (part of 14401)
6	13K359	Multifunction switch

Removal and Installation

1. Remove the steering wheel. For additional information, refer to Section 211-04 .
2. Tilt the steering column all the way down and extend it all the way out.
3. Position the front wheels to the straight-ahead position.
4. Remove the 2 lower steering column shroud screws.
5. Remove the lower steering column shroud.
6. Remove the upper steering column shroud.
7. Remove the 2 multifunction switch screws.
8. Disconnect the electrical connector.
9. Release the 2 tabs and slide the multifunction switch out of the clockspring.



10. To install, reverse the removal procedure.

Climate Control System

Printable View (580 KB)

⚠ WARNING: To avoid accidental deployment and possible injury, the air bag system backup power supply must be depleted before repairing any climate control components. To deplete the backup power supply, disconnect the battery ground cable and wait one minute.

⚠ WARNING: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside the closed area.

⚠ WARNING: R-134a is classified as a safe refrigerant, but misuse can make it dangerous. The following precautions must be observed:

- Always wear safety goggles when repairing an air conditioning system.
- Avoid contact with liquid refrigerant R-134a. R-134a vaporizes at approximately -25°C (-13°F) under atmospheric pressure and it will freeze skin tissue.
- Never allow refrigerant R-134a gas to escape in quantity in an occupied space. R-134a is non-toxic, but it will displace the oxygen needed to support life.
- Never use a torch in an atmosphere containing R-134a gas. R-134a is non-toxic at all normal conditions, but when it is exposed to high temperatures, such as a torch flame, it decomposes. During decomposition it releases irritating and toxic gases (as described in the MSDS sheet from the manufacturer). Decomposition products are hydrofluoric acid, carbon dioxide and water.
- Do not allow any portion of the charged air conditioning system to become too hot. The pressure in an air conditioning system rises as the temperature rises and temperatures of approximately 85°C (185°F) can be dangerous.
- Allow the engine to cool sufficiently prior to carrying out maintenance or serious burns and injury can occur.

⚠ CAUTION: To avoid damaging the vehicle or A/C components, the following precautions must be observed:

- The A/C refrigerant of all vehicles must be identified and analyzed prior to refrigerant charging. Failure to do so can contaminate the shop bulk refrigerant and other vehicles.
- Do not add R-12 refrigerant to an A/C system that requires the use of R-134a refrigerant. These two types of refrigerant must never be mixed. Doing so can damage the A/C system.
- Charge the A/C system with the engine running using the low-pressure side of the A/C system.
- Use only R-134a refrigerant. Due to environmental concerns, when the air conditioning system is drained, the refrigerant must be collected using refrigerant recovery/recycling equipment. Federal law REQUIRES that R-134a be recovered into appropriate recovery equipment and the process be conducted by qualified technicians who have been certified by an approved organization, such as MACS, ASI, etc. Use of a recovery machine dedicated to R-134a is necessary to reduce the possibility of oil and refrigerant incompatibility concerns. Refer to the instructions provided by the equipment manufacturer when removing refrigerant from or charging the air conditioning system.
- Refrigerant R-134a must not be mixed with air for leak testing or used with air for any other purpose above atmospheric pressure. R-134a is combustible when mixed with high concentrations of air and higher pressures.
- A number of manufacturers are producing refrigerant products that are described as direct substitutes for refrigerant R-134a. The use of any unauthorized substitute refrigerant can severely damage the A/C components. If repair is required, use only new or recycled refrigerant R-134a.

⚠ CAUTION: To avoid contamination of the A/C system:

- Never open or loosen a connection before discharging the system.
- When loosening a connection, if any residual pressure is evident, allow it to leak out before opening the fitting.
- Before charging, evacuate a system that has been opened to install a new component or a system that has discharged through leakage.
- Seal open fittings with a cap or plug immediately after disconnecting a component from the system.
- Clean the outside of the fittings thoroughly before disconnecting a component from the system.
- Do not remove the sealing caps from a new component until ready to install.
- Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open an oil container until ready to use, and install the cap immediately after using. Store the oil in a clean, moisture-free container.
- Install a new O-ring seal before connecting an open fitting. Coat the fitting and the O-ring seal with refrigerant oil before connecting.
- When installing a refrigerant line, avoid sharp bends. Position the line away from the exhaust or any sharp edges that can chafe the line.
- Tighten threaded fittings only to specifications. The steel and aluminum fittings used in the refrigerant system will not tolerate overtightening.
- When disconnecting a fitting, use a wrench on both halves of the fitting to prevent twisting of the refrigerant lines or tubes.
- Do not open a refrigerant system or uncap a new component unless it is as close as possible to room temperature. This will prevent condensation from forming inside a component that is cooler than the surrounding air.

The dual automatic temperature control system maintains the selected vehicle interior temperature by heating and/or cooling the air.

- During A/C operation the system also reduces the relative humidity of the air.
- The driver may override the automatic mode of operation.

Heat Transfer

If two substances of different temperature are placed near each other, the heat in the warmer substance will transfer to the colder substance.

Latent Heat of Vaporization

When a liquid boils (converts to gas) it absorbs heat without raising the temperature of the resulting gas. When the gas condenses (converts back to a liquid), it gives off heat without lowering the temperature of the resulting liquid.

Relative Humidity

The amount of moisture (water vapor content) that the air can hold is directly related to the air temperature. The more heat there is in the air, the more moisture the air can hold. The lower the moisture content in the air, the more comfortable you feel. Removing moisture from the air lowers its relative humidity and improves personal comfort.

Effects of Pressure on Boiling or Condensation

As the pressure is increased on a liquid, the temperature at which the liquid boils (converts to gas) also increases. Conversely, when the pressure on a liquid is reduced, its boiling point is also reduced. When in the gas state, an increase in pressure causes an increase in temperature, while a decrease in pressure will decrease the temperature of the gas.

The Refrigerant Cycle

During stabilized conditions (air conditioning system shutdown), the refrigerant is in a vaporized state and pressures are equal throughout the system. When the A/C compressor is in operation it increases pressure on the refrigerant vapor, raising its temperature. The high-pressure and high-temperature vapor is then released into the top of the A/C condenser core.

The A/C condenser, being close to ambient temperature, causes the refrigerant vapor to condense into a liquid when heat is removed from the refrigerant by ambient air passing over the fins and tubing. The now liquid refrigerant, still at high pressure, exits from the bottom of the A/C condenser and enters the inlet side of the A/C receiver drier. The receiver drier is designed to remove moisture from the refrigerant.

The outlet of the receiver drier is connected to the thermostatic expansion valve (TXV). The TXV provides the orifice which is the restriction in the refrigerant system and separates the high and low pressure sides of the A/C system. As the liquid refrigerant passes across this restriction, its pressure and boiling point are reduced.

The liquid refrigerant is now at its lowest pressure and temperature. As it passes through the A/C evaporator, it absorbs heat from the airflow passing over the plate/fin sections of the A/C evaporator. This addition of heat causes the refrigerant to boil (convert to gas). The now cooler air can no longer support the same humidity level of the warmer air and this excess moisture condenses on the exterior of the evaporator coils and fins and drains outside the vehicle.

The refrigerant cycle is now repeated with the A/C compressor again increasing the pressure and temperature of the refrigerant.

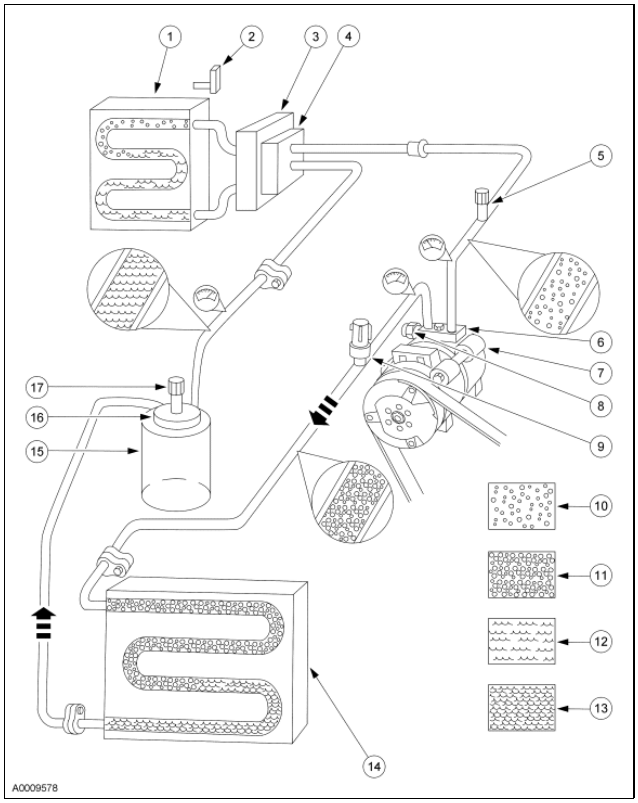
A thermistor which monitors the temperature of the air that has passed through the evaporator core controls A/C clutch cycling. If the temperature of the evaporator core discharge air is low enough to cause the condensed water vapor to freeze, the A/C clutch is disengaged by the vehicle powertrain control module (PCM).

The high-side line pressure is also monitored so that A/C compressor operation will be interrupted if the system pressure becomes too high or is determined to be too low (low charge condition).

The A/C compressor thermal protection switch will interrupt compressor operation if the compressor housing exceeds temperature limits.

The A/C compressor relief valve will open and vent refrigerant to relieve unusually high system pressure.

Clutch Cycling Thermostatic Expansion Valve Type Refrigerant System



Item	Part Number	Description
1	19860	A/C evaporator core

Dual Automatic Temperature Control (DATC) Module Description

The DATC system automatically maintains a selected temperature for vehicle interior comfort and regulates the volume of airflow between the instrument panel registers, floor ducts, windshield defroster nozzle, and side window demisters. The system will automatically select between fresh and recirculated air with an optional manual override. The DATC system will also include a manual A/C override, blower speed override,

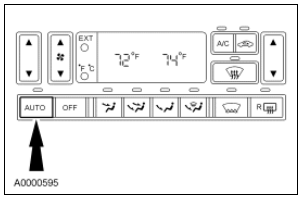
and airflow direction overrides.

The dual temperature zone feature provides the driver and the front seat passenger with their own independent temperature set points. The DATC system provides both the driver and front seat passenger with their selected temperature for interior comfort. In situations where the difference between the driver and the front seat passenger set points are very large, the DATC will tend to favor the driver's setting and make the front seat passenger as comfortable as possible.

The driver and front seat passenger will not have independent air distribution mode or fan controls so the system is dual temperature only. In some cases the passenger temperature set point may influence the air distribution mode or blower speed in automatic mode.

System Air Flow

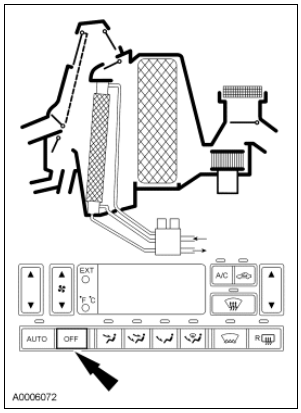
AUTO



When AUTO is selected:

- The temperature control setting(s) are manually set to the desired setting(s).
- The air inlet door actuator is automatically controlled by the DATC module, based on the temperature setting(s), but can be manually overridden by selecting the recirculation button.
- The panel door, floor door and defrost door actuators are automatically controlled by the DATC module based on the temperature setting(s), but can be manually overridden by selecting any of the air distribution buttons.
- The dual coolant control valve is automatically controlled by the DATC module based on the temperature setting(s).
- The A/C compressor is automatically controlled by the DATC module based on the temperature setting(s), but can be manually overridden by selecting the A/C button. The A/C compressor will not operate if the outside temperature is lower than approximately 2°C (35°F).
- The blower motor is on. The blower motor speed is automatically controlled by the DATC module based on the temperature setting(s), but can be manually overridden by adjusting the blower speed rocker button.

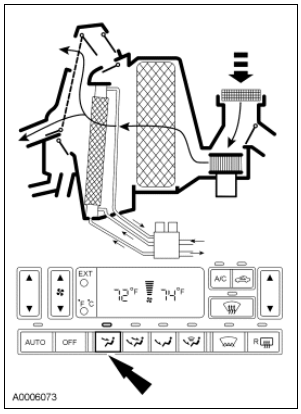
OFF



When OFF is selected:

- The air inlet door actuator positions the air inlet door to close off outside air from entering the passenger compartment.
- The floor door actuator positions the floor door in the OPEN position, and the panel door actuator, defrost door actuator, position the panel door and defrost door in the CLOSED position. This closes off airflow to the defrost duct, the side window demisters and the instrument panel A/C registers.
- The dual coolant control valve is in the CLOSED position, preventing the flow of hot coolant to the heater core.
- The blower motor is OFF.

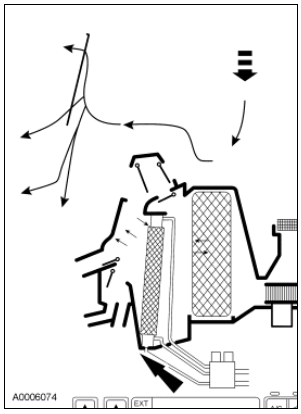
PANEL



When PANEL is selected:

- The Recirc request button is enabled. If the Recirc request button is selected (indicator ON), the air inlet door actuator positions the air inlet door to close off outside air from entering the passenger compartment. If the Recirc request button is not selected (indicator OFF), the air inlet door actuator positions the air inlet door to admit only outside air into the passenger compartment.
- The panel door actuator positions the panel door in the OPEN position and the floor door and defrost door actuators position the floor door and defrost door in the CLOSED position, directing airflow to the instrument panel A/C registers.
- The dual coolant control valve is automatically controlled by the DATC module based on the temperature setting(s).
- The A/C request button is enabled. When the A/C request button is selected (indicator ON), the A/C compressor will operate if the outside air temperature is above approximately 2°C (35°F). When the A/C request button is not selected (indicator OFF), the A/C compressor will not operate and the air cannot be cooled below the outside temperature.
- The blower motor is ON.

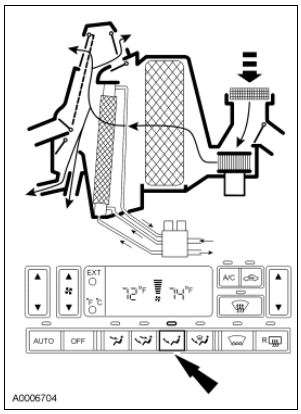
PANEL/FLOOR



When PANEL/FLOOR is selected:

- The Recirc request button is enabled. If the Recirc request button is selected (indicator ON), the air inlet door actuator positions the air inlet door to close off outside air from entering the passenger compartment. If the Recirc request button is not selected (indicator OFF), the air inlet door actuator positions the air inlet door to admit only outside air into the passenger compartment.
- The panel door and floor door actuators position the panel door and floor door in the OPEN position and the defrost door actuator positions the defrost door in the CLOSED position, directing airflow to the instrument panel A/C registers and the floor duct.
- The dual coolant control valve is automatically controlled by the DATC module based on the temperature setting(s).
- The A/C request button is enabled. When the A/C request button is selected (indicator ON), the A/C compressor will operate if the outside air temperature is above approximately 2°C (35°F). When the A/C request button is not selected (indicator OFF), the A/C compressor will not operate and the air cannot be cooled below the outside temperature.
- The blower motor is ON.

FLOOR

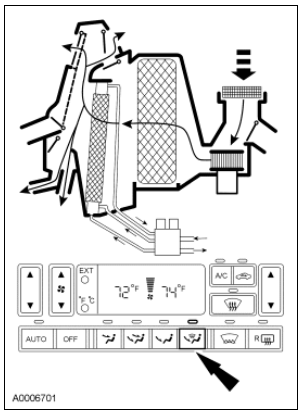


When FLOOR is selected:

- The Recirc request button is enabled. If the Recirc request button is selected (indicator ON), the air inlet door actuator positions the air inlet door to close off outside air from entering the passenger compartment. If the Recirc request button is not selected (indicator OFF), the air inlet door actuator positions the air inlet door to admit only outside air into the passenger compartment. The DATC will automatically revert to the outside air position after approximately 1 to 4 minutes to prevent window fogging.
- The floor door actuator positions the floor door in the OPEN position and the panel door and defrost door actuators position the panel door and defrost door in the CLOSED position, directing airflow to the floor duct. A small amount of airflow from the outboard instrument panel A/C registers will be

present.
- The dual coolant control valve is automatically controlled by the DATC module based on the temperature settings.
- The A/C request button is enabled. When the A/C request button is selected (indicator ON), the A/C compressor will operate if the outside air temperature is above approximately 2°C (35°F). When the A/C request button is not selected (indicator OFF), the A/C compressor will not operate and the air cannot be cooled below the outside temperature.
- The blower motor is ON.

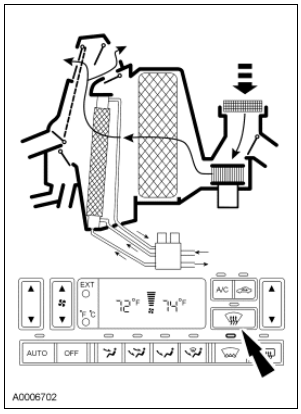
FLOOR/DEFROST



When FLOOR/DEFROST is selected:

- The Recirc request button is enabled. If the Recirc request button is selected (indicator ON), the air inlet door actuator positions the air inlet door to close off outside air from entering the passenger compartment. If the Recirc request button is not selected (indicator OFF), the air inlet door actuator positions the air inlet door as to admit only outside air into the passenger compartment. The DATC will automatically revert to the outside air position after approximately 1 to 4 minutes to prevent window fogging.
- The floor door and defrost door actuators position the floor door and defrost door in the OPEN position and the panel door actuator positions the panel door in the CLOSED position, directing airflow to the floor duct, the windshield defroster ducts, and the side window demisters. A small amount of airflow from the outboard instrument panel A/C registers will be present.
- The dual coolant control valve is automatically controlled by the DATC module based on the temperature settings.
- The A/C request button is enabled. When the A/C request button is selected (indicator ON), the A/C compressor will operate if the outside air temperature is above approximately 2°C (35°F). When the A/C request button is not selected (indicator OFF), the A/C compressor will not operate and the air cannot be cooled below the outside temperature.
- The blower motor is ON.

DEFROST



When DEFROST is selected:

- The Recirc request button is disabled. The air inlet door actuator positions the air inlet door to admit only outside air into the passenger compartment.
- The defrost door actuator positions the defrost door in the OPEN position and the panel door and floor door actuators position the panel door and floor door in the CLOSED position, directing airflow to the windshield defroster ducts and the side window demisters. A small amount of airflow from the outboard instrument panel A/C registers will be present.
- The dual coolant control valve is automatically controlled by the DATC module based on the temperature settings.
- The A/C request button is disabled. To reduce fogging, the A/C compressor will operate if the outside air temperature is above approximately 2°C (35°F).
- The blower motor is ON.

Refer to Wiring Diagrams Cell 55 for schematic and connector information.

Special Tool(s)

ST2332-A	Worldwide Diagnostic System (WDS) Vehicle Communication Module (VCM) with appropriate adapters, or equivalent diagnostic tool
ST1137-A	Fluke 77 III Automotive Meter 105-R0056 or equivalent
ST1928-A	R-134a Manifold Gauge Set 176-R032A or equivalent
ST1501-A	A/C Pressure Test Adapter 412-093 (T94P-19623-E)
ST1252-A	Set, A/C Fittings 412-DS028 (014-00333, D93L-19703B) or equivalent
ST2351-A	Refrigerant Leak Detector 216-00001 or equivalent
ST1474-A	Pressure Test Kit 014-R1072 or equivalent
ST2396-A	Vacuum Check Fitting, TXV 412-129 or equivalent

Principles of Operation

The 4 main principles involved with the basic theory of operation are:

- heat transfer
- latent heat of vaporization
- relative humidity
- effect of pressure on boiling or condensation

Inspection and Verification

1. Verify the customer's concern by operating the climate control system to duplicate the condition.

2. Inspect to determine if one of the following mechanical or electrical concerns apply:

   Visual Inspection Chart

Mechanical	Electrical
• Loose, missing or damaged A/C compressor drive belt • Loose or disconnected A/C clutch • Broken or leaking refrigerant lines • Obstructed in-vehicle temperature sensor • Disconnected in-vehicle temperature aspirator hose • A/C registers are not working (open/close) • Front floor ducts not in place • Incorrectly installed in-vehicle temperature sensor • Incorrectly installed ambient air temperature sensor	• Fuse(s) • Blower motor inoperative • A/C compressor inoperative • Circuit short/open. • Disconnected, loose fitting, or incorrectly installed electrical connectors and pins • Cooling fan inoperative • Relays not functional or not installed

3. As pinpoint tests and measurements are being carried out, be sure to inspect for any disconnected, loose-fitting, or incorrectly installed component, module and in-line electrical connectors and pins.

4. If the inspection reveals obvious concerns that can be readily identified, repair as necessary.

5. If the concern remains after the inspection, connect the diagnostic tool to the data link connector (DLC) located beneath the instrument panel and select the vehicle to be tested from the diagnostic tool menu. If the vehicle selection cannot be entered:
   - check that the program card is correctly installed.
   - check the connections to the vehicle.
   - check the ignition switch position.
   - check that the battery voltage is greater than 9V.

If the diagnostic tool still does not allow the vehicle selection to be entered, refer to the diagnostic tool manual.

6. Carry out the Data Link Diagnostic Test using the diagnostic tool. If the diagnostic tool responds with:
   - SCP+, SCP- or UBP circuits fault = ALL MODULE NO RESPONSE/NOT EQUIPPED, go to Module Communication Network Diagnostics to diagnose the network concern.
   - If the powertrain control module (PCM) is not listed for a communication concern, turn the A/C controls to OFF and execute the self-test diagnostics for the PCM.
   - If the DATC module is not listed for a communication concern, execute the self-test diagnostics for the DATC module.

7. If any PCM or DATC DTCs are retrieved, and are related to the concern, go to the Powertrain Control Module Diagnostic Trouble Code (DTC) Index or the Dual Automatic Temperature Control (DATC) Module Diagnostic Trouble Code (DTC) Index in this section to continue the diagnostics.

8. If no DTCs related to the concern are retrieved, GO to Symptom Chart to continue the diagnostics.

9. If the DATC module cannot be accessed by the diagnostic tool, Go To Pinpoint Test A .

Dual Electronic Automatic Temperature Control (DATC) Module Diagnostic Trouble Codes DTCs

If using the diagnostic tool or front panel diagnostics to check for DATC DTCs:

1. Check continuous DTCs.

2. Run DATC self-test. Refer to Front Panel DATC Self-Test (On-Demand Diagnostic Trouble Codes DTCs).

General Information:

- If the DTC is continuous only and does not appear in the self-test, this indicates an intermittent fault condition, such as a poor wiring connection or a loose terminal. If the DATC does not appear after running the self-test it may also indicate that the DTC may no longer exist.
- If the DTC is continuous and appears in the self-test, this indicates a hard fault. A hard fault suggests a permanent wiring failure, disconnected connector or component failure.

Front Panel DATC Module Self-Test (On-Demand Diagnostic Trouble Codes DTCs)

On-demand DTCs are those that are reported by an ECU when a failure is detected while executing a diagnostic test. For the DATC module this means that all faults (hard) that occur while the module is conducting a self-test shall be reported as an on-demand DTC.

- The DATC module self-test will not detect concerns associated with data link messages such as engine coolant temperature or vehicle speed signals. The diagnostic tool must be used to retrieve these concerns.
- The vehicle interior temperature should be between 0-32°C (32-90°F) when carrying out the self-test. If the temperatures are not within the specified ranges, false temperature sensor DTCs may be displayed.

The DATC module self-test through the front panel display:

- can be initiated at any time. Normal operation of the system stops when the self-test is activated.
- is entered by pressing the OFF and DEFROST buttons simultaneously and then pressing the AUTO button within 2 seconds. Record all DTCs displayed.
- concludes by reporting all on-demand DTCs. Follow the diagnostics procedure given under ACTION in the DTC index for each DTC given.
- reports individual on-demand DTCs as 4-digit DTCs (less the alpha character).
- will calibrate all the mode doors and check all analog inputs. The DATC module will only report on-demand (hard) faults that occurred while the DATC module was conducting its self-test.
- will light all control panel display segments if no faults are detected.
- will report individual on-demand DTCs without the °C symbol lit.

To exit the self-test, press the DEFROST button. This will clear all on-demand codes from the DATC module memory. If no button is pushed, DTCs will continue to be displayed.

Upon exit from the self-test the DATC module returns to operational status. The DATC module executes a hard (cold boot) reset which places the DATC system in the OFF mode.

If a condition exists but no DTCs appear during the self-test, GO to Symptom Chart Condition: The DATC System Is Inoperative, Intermittent or Incorrect Operation.

Always exit the self-test before powering the system down (system turned OFF).

Front Panel DATC Module Display Retrieve Continuous Diagnostic Trouble Codes (DTCs)

Continuous DTCs are fault codes recorded by the DATC module which have occurred during normal operation. For the DATC module this means that all faults (intermittent or hard) that occur while the module is in an operational state shall be reported as a continuous DTC.

- To retrieve continuous DTCs, press the OFF and DEFROST buttons simultaneously, followed by pressing the RECIRC button within 2 seconds.
- The DATC module will report all continuous DTCs to the vacuum fluorescent (VF) display.
- The DATC module will not carry out a self-test; it will only display continuous faults codes which are stored in memory.
- All VF display segments will light if no faults are detected.
- Individual continuous DTCs will be reported with the °C symbol lit.
- DTCs shall be reported as a 4-digit DTC (less the alpha character).
- Pressing the front DEFROST button will exit the retrieve continuous DTCs mode and clear all continuous DTCs from DATC module memory.
- Pressing any other button (other than DEFROST) will exit the retrieve continuous DTCs mode and maintain all continuous DTCs in DATC module memory.
- Upon exit from the retrieve continuous DTCs mode the DATC module returns to operational status. The DATC module executes a hard (cold boot) reset which places the DATC system in the OFF mode.

Diagnostic Trouble Code Index

Powertrain Control Module (PCM) Diagnostic Trouble Code (DTC) Index

DTC	Description	Action
P1460	WOT A/C Cutout Internal Driver Malfunction	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1461	A/C Pressure Sensor Circuit High Input	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1462	A/C Pressure Sensor Circuit Low Input	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1463	A/C Pressure Sensor Insufficient Pressure Variation	REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual.
P1469	Low A/C Cycling Period	REFER to thePowertrain Control/Emissions Diagnosis (PC/ED) manual.
P1474	Low Speed Fan Internal Driver Failure	REFER to thePowertrain Control/Emissions Diagnosis (PC/ED) manual.
P1479	High Speed Fan Internal Driver Failure	REFER to thePowertrain Control/Emissions Diagnosis (PC/ED) manual.
P1464	A/C Demand Out Of Self-Test Range	REFER to thePowertrain Control/Emissions Diagnosis (PC/ED) manual.

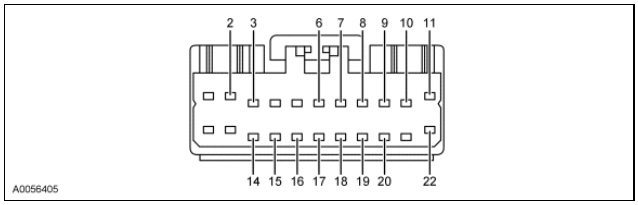
Symptom Chart

Symptom Chart
Connector Circuit Reference

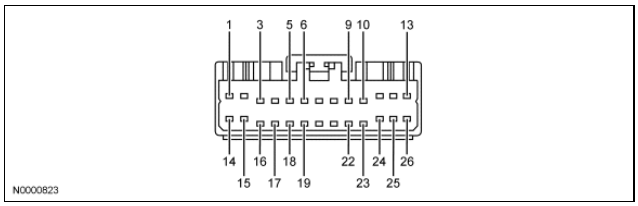
DATC Module C228a



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
2	CKT 31-FA10 (BK) DATC module ground	Less than 5 ohms to chassis ground.
3	CKT 20-FA10 (PK/OG) DATC ignition voltage feed	Greater than 10 volts to chassis ground with the ignition ON.
6	CKT 8-FA51 (WH/BK) passenger heater core discharge temperature sensor signal circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
7	CKT 8-FA53 (WH/BU) A/C solar radiation sensor driver side signal circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

8	CKT 9-FA49 (BN/WH) ambient air temperature sensor ground circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
9	CKT 8-FA48 (WH/GN) in-vehicle temperature sensor signal circuit	Resistance of 24,000-37,000 ohms to chassis ground.
10	CKT 8-FA44 (WH/RD) evaporator core temperature sensor signal circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
11	CKT 9-FA1 (BN/RD) air inlet door actuator return circuit	Resistance of 3,000-5,000 ohms to chassis ground.
14	CKT 29-FA10 (OG/GN) DATC battery voltage feed	Greater than 10 volts at all times.
15	CKT 8-FA45 (WH/BU) output to the blower motor speed control	Greater than 10,000 ohms to chassis ground and 0 volts.
16	CKT 9-FA44 (BN/RD) evaporator core temperature sensor ground circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
17	CKT 8-FA49 (WH/VT) ambient air temperature sensor signal circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
18	CKT 8-FA47 (WH/GN) passenger heater core discharge temperature sensor signal circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
19	CKT 9-FA3 (BN/RD) driver/passenger heater core discharge temperature sensor ground circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
20	CKT 10-FA53 (GY/VT) A/C solar radiation sensor passenger side signal circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
22	CKT 7-FA1 (YE/RD) actuator reference voltage circuit	Resistance of 800-1,000 ohms to chassis ground.

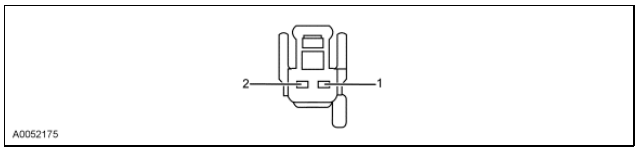
DATC Module C228b



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 8-FB5 (WH/BK) defrost actuator feedback circuit	Approximately 0-5 volts with the DATC ON.
3	CKT 8-FB7 (WH) panel actuator feedback circuit	Approximately 0-5 volts with the DATC ON.
5	CKT 91S-FB3 (BN/BU) passenger coolant control valve switched ground circuit	Greater than 10 volts at all times.
6	CKT 91S-FB4 (BN/GN) driver coolant control valve switched ground circuit	Greater than 10 volts at all times.
9	CKT 33-FB8 (YE/RD) air inlet actuator close circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
10	CKT 32-FB8 (WH/RD) air inlet actuator open	Greater than 10,000 ohms to chassis

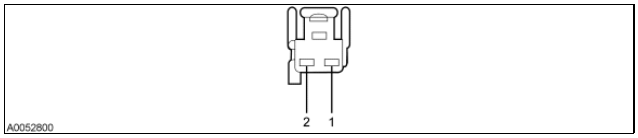
	circuit	ground and 0 volts.
13	CKT 32-FB5 (WH/BK) defrost actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
14	CKT 9-FA48 (BN/GN) in-vehicle temperature sensor ground circuit	Approximately 0-5 volts with the DATC ON.
15	CKT 8-FB8 (WH/RD) air inlet actuator feedback circuit	Approximately 0-5 volts with the DATC ON.
16	CKT 8-FB6 (WH/VT) floor actuator feedback circuit	Approximately 0-5 volts with the DATC ON.
17	CKT 9-FA2 (BN/RD) floor/panel/defrost actuators ground circuit	Approximately 0-5 volts with the DATC ON.
18	CKT 91S-FA76 (BN/BU) auxiliary coolant pump relay switched ground circuit	Greater than 10 volts at all times.
19	CKT 31S-FA23 (BK/BU) blower motor relay switched ground circuit	Greater than 10 volts at all times.
22	CKT 32-FB6 (WH/VT) floor actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
23	CKT 33-FB6 (YE/VT) floor actuator close circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
24	CKT 32-FB7 (WH) panel actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
25	CKT 33-FB7 (YE) panel actuator closed circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
26	CKT 33-FB5 (YE/BK) defrost actuator closed circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

In-Vehicle Temperature Sensor C233



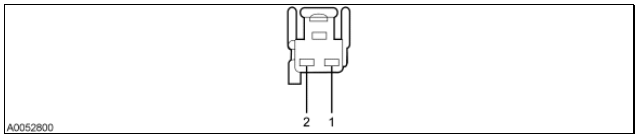
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 8-FA48 (WH/GN) in-vehicle air temperature sensor input	Approximately 5 volts with the DATC ON.
2	CKT 9-FA48 (BN/GN) sensor signal return (ground)	Less than 5 ohms to chassis ground.

Discharge Temperature Sensor (LH) C235



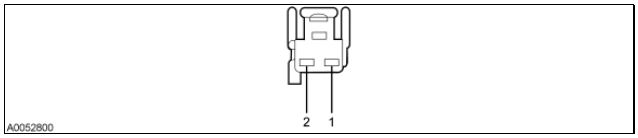
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 9-FA47 (BN/GN) sensor signal return (ground)	Less than 5 ohms to chassis ground.
2	CKT 8-FA47 (WH/GN) LH discharge temperature sensor input	Approximately 5 volts with the DATC ON.

Discharge Temperature Sensor (RH) C255



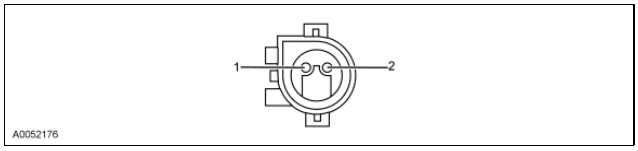
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 9-FA51 (BN/YE) sensor signal return (ground)	Less than 5 ohms to chassis ground.
2	CKT 8-FA51 (WH/BK) RH discharge temperature sensor input	Approximately 5 volts with the DATC ON.

Evaporator Discharge Air Temperature Sensor C296



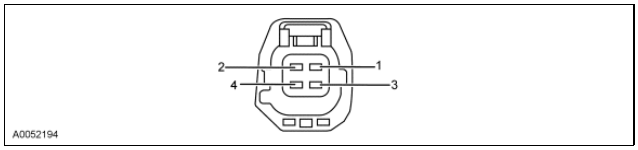
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 9-FA44 (BN/RD) sensor signal return (ground)	Less than 5 ohms to chassis ground.
2	CKT 8-FA44 (WH/RD) evaporator discharge air temperature sensor input	Approximately 5 volts with the DATC ON.

Ambient Air Temperature Sensor C132



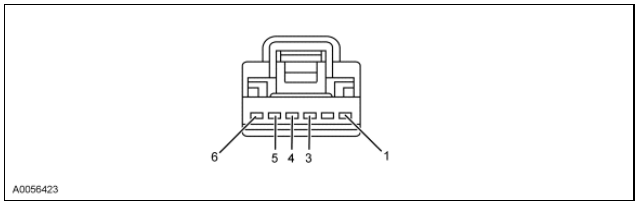
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 8-FA49 (WH/VT) ambient air temperature sensor input	Approximately 5 volts with the DATC ON.
2	CKT 9-FA49 (BN/WH) sensor signal return (ground)	Less than 5 ohms to chassis ground.

Blower Motor Speed Control Module C297



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 31S-FA18 (BK/RD) blower motor speed control module to blower motor	Greater than 10,000 ohms to chassis ground and 0 volts.
2	CKT 31-FA45 (BK) blower motor speed control module ground	Less than 5 ohms to chassis ground.
3	CKT 8-FA45 (WH/BU) DATC module to blower motor speed control module input	Less than 1 volt in the lowest blower setting to greater than 4.5 volts in the highest blower setting.
4	CKT 30S-FA18 (RD/BK) voltage supply to blower motor speed control module	Greater than 10 volts with the DATC ON.

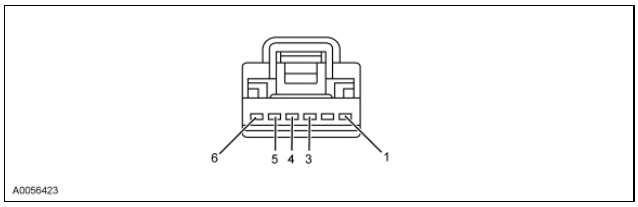
Air Inlet Door Actuator C289



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 33-FB8 (YE/RD) door actuator close circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

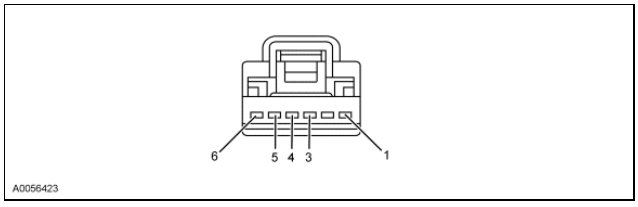
3	CKT 8-FB8 (WH/RD) door actuator feedback circuit	Less than 5 ohms chassis ground.
4	CKT 7-FB8 (YE/RD) door actuator reference voltage	Greater than 4.5 volts to chassis ground with the DATC ON.
5	CKT 9-FB8 (BN/RD) door actuator ground	Less than 5 ohms chassis ground.
6	CKT 32-FB8 (WH/RD) door actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

Floor Mode Door Actuator C234



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 32-FB6 (WH/VT) door actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
3	CKT 8-FB6 (WH/VT) door actuator feedback circuit	Less than 5 ohms chassis ground.
4	CKT 9-FB6 (BN/WH) door actuator ground	Less than 5 ohms chassis ground.
5	CKT 7-FB6 (YE/VT) door actuator reference voltage	Greater than 4.5 volts to chassis ground with the DATC ON.
6	CKT 33-FB6 (YE/VT) door actuator close circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

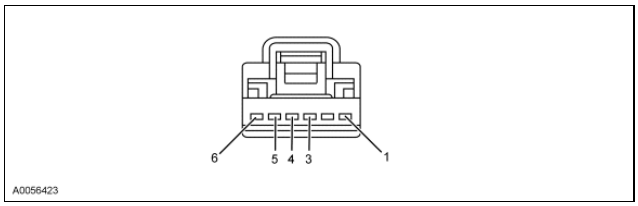
Panel Mode Door Actuator C236



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 33-FB7 (YE) door actuator close circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
3	CKT 8-FB7 (WH) door actuator feedback circuit	Less than 5 ohms chassis ground.

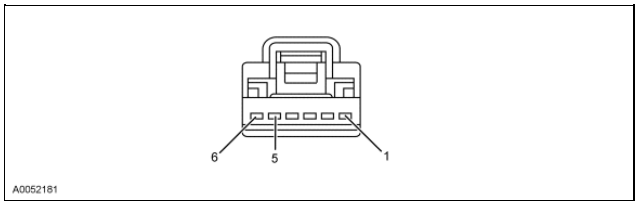
4	CKT 7-FB7 (YE) door actuator reference voltage	Greater than 4.5 volts to chassis ground with the DATC ON.
5	CKT 9-FB7 (BN) door actuator ground	Less than 5 ohms chassis ground.
6	CKT 32-FB7 (WH) door actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

Defrost Mode Door Actuator C232



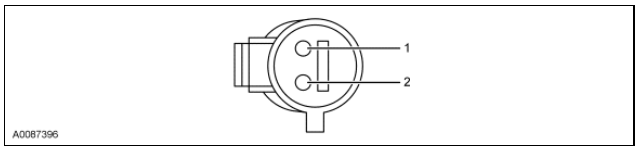
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 33-FB5 (YE/BK) door actuator close circuit	Greater than 10,000 ohms to chassis ground and 0 volts.
3	CKT 8-FB5 (WH/BK) door actuator feedback circuit	Less than 5 ohms chassis ground.
4	CKT 7-FB5 (YE/BK) door actuator reference voltage	Greater than 4.5 volts to chassis ground with the DATC ON.
5	CKT 9-FB5 (BN/YE) door actuator ground	Less than 5 ohms chassis ground.
6	CKT 32-FB5 (WH/BK) door actuator open circuit	Greater than 10,000 ohms to chassis ground and 0 volts.

Solar Radiation Sensor C286



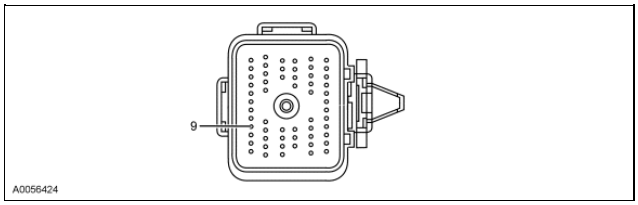
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 8-FA53 (WH/BU) solar radiation sensor input	Greater than 4.5 volts to chassis ground with the DATC ON.
5	CKT 31-LE42 (BK/OG) ground	Less than 5 ohms chassis ground.
6	CKT 10-FA53 (GY/VT) solar radiation sensor input	Greater than 4.5 volts to chassis ground with the DATC ON.

A/C Compressor Clutch Field Coil C100



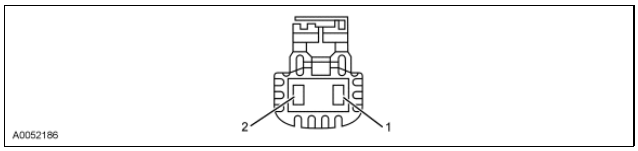
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 31-FA6 (BK/YE) ground	Less than 5 ohms chassis ground.
2	CKT 15-FA6 (GN/YE) A/C compressor clutch relay switched output	Greater than 10 volts with the A/C commanded ON.

Powertrain Control Module (PCM) C175a



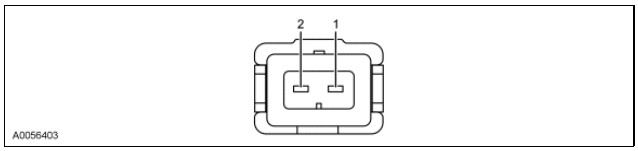
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
9	CKT 91S-FA79 (BN/BU) A/C compressor clutch relay control	Greater than 10 volts with the ignition ON.

Blower Motor C288



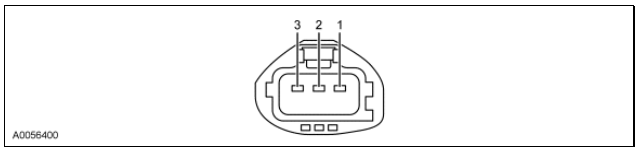
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 30S-FA18 (RD/BK) blower motor relay switched output	Greater than 10 volts with the DATC ON.
2	CKT 31S-FA18 (BK/RD) blower motor relay to blower motor control module	Resistance of less than 5 ohms to chassis ground with blower in the highest setting.

Auxiliary Coolant Pump Motor C163



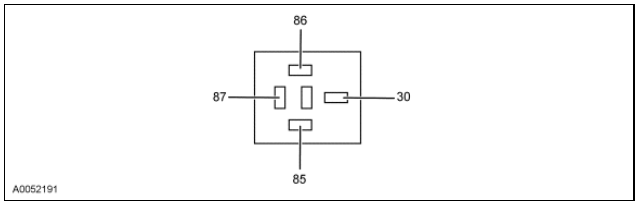
Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 30S-FB1 (RD/YE) auxiliary coolant pump motor switched voltage from the auxiliary coolant pump relay.	Greater than 10 volts with the auxiliary coolant pump relay ON.
2	CKT 31-FB1 (BK/YE) auxiliary coolant pump ground	Less than 5 ohms to chassis ground.

Coolant Control Valve Solenoid C1034



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 91S-FB4 (BN/GN) coolant control valve voltage feed circuit	Less than 5 ohms with the DATC in full COOL mode.
2	CKT 30-FB3 (RD/OG) driver coolant control valve switched ground circuit	Greater than 10 volts at all times.
3	CKT 91S-FB3 (BN/BU) passenger coolant control valve switched ground circuit	Less than 5 ohms with the DATC in full COOL mode.

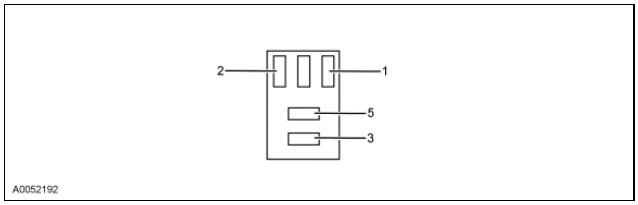
Blower Motor Relay



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
30	CKT 30-FA24 (RD/OG) blower motor relay switch voltage	Greater than 10 volts at all times.
85		

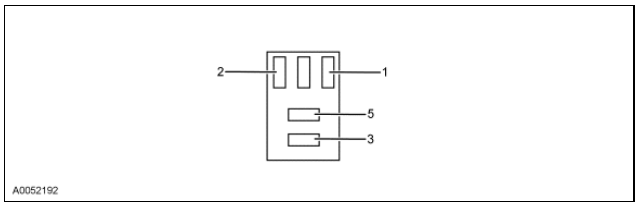
	CKT 31S-FA23 (BK/BU) blower motor relay control from DATC module	Less than 100 ohms to chassis ground with the blower in the lowest setting.
86	CKT 30-FA24 (RD/OG) blower motor relay coil voltage	Greater than 10 volts at all times.
87	CKT 30S-FA18 (RD/BK) blower motor relay switched output	Less than 5 ohms to chassis ground with the blower in the highest setting.

A/C Compressor Clutch Relay



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 15S-FA79 (GN/RD) A/C clutch relay coil voltage	Greater than 10 volts with the ignition ON.
2	CKT 91S-FA79 (BN/BU) A/C compressor clutch relay control	Resistance of less than 5 ohms to chassis ground when the A/C is commanded ON.
3	CKT 30-FA79 (RD/OG) A/C clutch relay switch voltage	Greater than 10 volts at all times.
5	CKT 15S-FA6 (GN/YE) A/C compressor clutch relay switched output	Less than 100 ohms to chassis ground.

Auxiliary Coolant Pump Relay



Pin Number(s)	Circuit Designation/Description	Normal Condition/Measurement
1	CKT 30-FA74A (RD/GN) auxiliary coolant pump relay coil voltage	Greater than 10 volts at all times.
2	CKT 91S-FA76 (BN/BU) auxiliary coolant pump relay control	Resistance of less than 5 ohms to chassis ground when the auxiliary coolant pump relay is commanded ON.
3		Greater than 10 volts at all times.

	CKT 30-FA74 (RD/GN) auxiliary coolant pump relay switch voltage	
5	CKT 30S-FB1 (RD/YE) auxiliary coolant pump relay switched output	Less than 100 ohms to chassis ground.

Pinpoint Tests

Pinpoint Test A: No Communication With The Dual Automatic Temperature Control (DATC) Module

Normal Operation

Under normal operation, the Dual Automatic Temperature Control (DATC) module receives battery voltage through circuit 29-FA10 (OG/GN) and ignition voltage through circuit 20-FA10 (PK/OG). A ground is provided for the DATC module through circuit 31-FA10 (BK).

Possible Causes

- An open in circuit 29-FA10 (OG/GN), 20-FA10 (PK/OG) or 31-FA10 (BK).
- DATC module.

PINPOINT TEST A: NO COMMUNICATION WITH THE DUAL AUTOMATIC TEMPERATURE CONTROL (DATC) MODULE

Test Step	Result / Action to Take
A1 CHECK THE CJB FUSE 220 (10A)	
• Key in OFF position. • Turn the headlights on. • **Does the DATC backlighting come on?**	**Yes** GO to A2 . **No** INSTALL a new fuse. TEST the system for normal operation.
A2 CHECK THE CJB FUSE 214 (10A)	
• Key in ON position. • **Does the vacuum fluorescent (VF) display and indicators come on when DATC buttons are pushed?**	**Yes** GO to A3 . **No** INSTALL a new fuse. TEST the system for normal operation.
A3 CHECK CIRCUIT 31-FA10 (BK) FOR AN OPEN	
• Disconnect: DATC Module C228a. • Measure the resistance between DATC module C228a-2, circuit 31-FA10 (BK), harness side and ground.	**Yes** GO to A4 . **No** REPAIR circuit 31-FA10 (BK). TEST the system for normal operation.

 A0002036 • **Is the resistance less than 5 ohms?**	
A4 CHECK CIRCUIT 29-FA10 (OG/GN) FOR VOLTAGE	
• Key in ON position. • Measure the voltage between DATC module C228a-14, circuit 29-FA10 (OG/GN), harness side and ground.  A0002317 • **Is the voltage greater than 10 volts?**	**Yes** GO to A5 . **No** REPAIR circuit 29-FA10 (OG/GN). TEST the system for normal operation.
A5 CHECK CIRCUIT 20-FA10 (PK/OG) FOR VOLTAGE	
• Key in ON position. • Measure the voltage between DATC module C228a-3, circuit 20-FA10 (PK/OG), harness side and ground.  A0002318 • **Is the voltage greater than 10 volts?**	**Yes** Diagnose the network concern. **No** REPAIR circuit 20-FA10 (PK/OG). TEST the system for normal operation.

Pinpoint Test B: The DATC System Is Inoperative, Intermittent or Incorrect Operation

Normal Operation

Under normal operation, the Dual Automatic Temperature Control (DATC) module receives battery voltage through circuit 29-FA10 (OG/GN) and ignition voltage through circuit 20-FA10 (PK/OG). A ground is provided for the DATC module through circuit 31-FA10 (BK).

Possible Causes

- An open in circuit 29-FA10 (OG/GN), 20-FA10 (PK/OG) or 31-FA10 (BK).
- DATC module.

PINPOINT TEST B: THE DATC SYSTEM IS INOPERATIVE, INTERMITTENT OR INCORRECT OPERATION

Test Step	Result / Action to Take
B1 VERIFY AUTOMATIC OPERATION	
• Key in ON position. • With the engine running, press the AUTOMATIC button. • **Does the indicator above the AUTO button illuminate and the selected temperature for both the driver and passenger appear in the display window?**	**Yes** GO to B2 . **No** GO to B11 .
B2 PERFORM THE DATC MODULE SELF-TEST	
• Key in ON position. • Carry out the DATC module self-test. Record the DTCs displayed, if any. • **Were any DTCs displayed as a result of the DATC self-test?**	**Yes** REFER to the DATC Module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as required. **No** GO to B3 .
B3 CHECK THE VACUUM FLUORESCENT DISPLAY	
• Exit self-test by pressing the DEFROST button. Observe the button indicators and function symbols displayed on the vacuum fluorescent display while changing the temperature, blower speed and functions. • **Are the display and indicators correct and complete without any missing elements?**	**Yes** GO to B4 . **No** INSTALL a new DATC module. TEST the system for normal operation.
B4 CHECK THE BLOWER MANUAL OVERRIDE OPERATION	
• Press the blower motor speed override control fully up and down. • **Does the blower motor speed increase from low to high speed?**	**Yes** GO to B5 . **No** If the blower motor is inoperative, Go To Pinpoint Test N . If the blower motor does not operate correctly, Go To Pinpoint Test O .
B5 VERIFY THE DEFROST OVERRIDE OPERATION	
• Press the override button for DEFROST operation. • **Is outside air being discharged from the windshield defroster nozzle and the side window demisters?**	**Yes** GO to B6 . **No** Go To Pinpoint Test C .
B6 VERIFY THE FLOOR OVERRIDE OPERATION	
	Yes

• Press the override button for FLOOR operation. • **Is outside air being discharged from the floor duct?**	GO to B7 . **No** Go To Pinpoint Test C .
B7 VERIFY THE VENT OVERRIDE OPERATION	
• Press the override button for VENT operation. • **Is outside air being discharged from the instrument panel registers?**	**Yes** GO to B8 . **No** Go To Pinpoint Test C .
B8 VERIFY THE A/C CLUTCH DOES NOT ENGAGE IN THE VENT MODE	
• Press the override button for VENT operation. • **Does the A/C clutch engage when the VENT override button is pressed?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual. **No** GO to B9 .
B9 VERIFY THE RECIRC OVERRIDE OPERATION	
• Press the VENT and RECIRC override buttons. • **Is recirculated air being discharged from the instrument panel registers?**	**Yes** GO to B10 . **No** Go To Pinpoint Test C .
B10 VERIFY A/C CLUTCH ENGAGEMENT IN THE A/C MODE	
• Press the VENT and A/C override buttons for A/C operation. • **Does the A/C clutch engage when the VENT and A/C override buttons are pressed?**	**Yes** The test is complete. The system is functioning normally. **No** Go To Pinpoint Test L .
B11 CHECK THE DATC MODULE FUNCTIONS	
• Press each function button and observe the display. • **Does the DATC perform and display any functions?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** GO to B12 .
B12 CHECK THE VOLTAGE TO THE DATC	
• Key in OFF position. • Disconnect: DATC C228a. • Key in ON position. • Measure the voltage between ground and DATC module C228a-14, circuit 29-FA10 (OG/GN).	**Yes** GO to B13 . **No** REPAIR the affected circuit. TEST the system for normal operation.

 A0002317 • Measure the voltage between ground and DATC module C228a-3, circuit 20-FA10 (PK/OG).  A0002318 • **Are the voltages greater than 10 volts?**	
B13 CHECK THE GROUND CIRCUIT TO THE DATC	
• Key in OFF position. • Measure the resistance between DATC module C228a-2, circuit 31-FA10 (BK) and ground.  A0002036 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 31-FA10 (BK) for an open. TEST the system for normal operation.

Pinpoint Test C: Incorrect/Erratic Direction Of Airflow From Outlets

Normal Operation

Under normal operation, to open the mode doors, the DATC module supplies the cold air bypass, air inlet, defrost, panel mode and floor mode door actuator motors voltage through the door actuator open circuits and ground through the door actuator close circuits. To close the mode doors, the DATC module reverses the voltage and ground circuits.

The mode door actuator feedback resistors are supplied a ground from the DATC module by the mode door actuator return circuits and a 5-volt reference voltage on the mode door actuator reference circuits. The DATC module reads the voltage on the mode door actuator feedback circuits to determine the mode door actuator position by the position of the actuator feedback resistor wiper arm.

- Door actuator open circuits:
  - Air inlet 32-FB8 (WH/RD)
  - Defrost 32-FB5 (WH/BK)
  - Panel mode 32-FB7 (WH)
  - Floor mode 32-FB6 (WH/VT)

- Door actuator close circuits:
  - Air inlet 33-FB8 (YE/RD)
  - Defrost 33-FB5 (YE/BK)
  - Panel mode 33-FB7 (YE)

- ♦ Floor mode 33-FB6 (YE/VT)

- Door actuator return circuits:
  - ♦ Air inlet 9-FB8 (BN/RD)
  - ♦ Defrost 9-FB5 (BN/YE)
  - ♦ Panel mode 9-FB7 (BN)
  - ♦ Floor mode 9-FB6 (BN/WH)

- Door actuator reference circuits:
  - ♦ Air inlet 7-FB8 (YE/RD)
  - ♦ Defrost 7-FB5 (YE/BK)
  - ♦ Panel mode 7-FB7 (YE)
  - ♦ Floor mode 7-FB6 (YE/VT)

- Door actuator feedback circuits:
  - ♦ Air inlet 8-FB8 (WH/RD)
  - ♦ Defrost 8-FB5 (WH/BK)
  - ♦ Panel mode 8-FB7 (WH)
  - ♦ Floor mode 8-FB6 (WH/VT)

Possible Causes

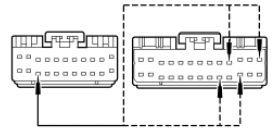
- An open, short to voltage, ground or together in door actuator open, close, return, reference or feedback circuits.
- Air inlet, defrost, panel mode and floor mode door actuator motor.
- DATC module.
- Stuck or bound linkage or door.

PINPOINT TEST C: INCORRECT/ERRATIC DIRECTION OF AIRFLOW FROM OUTLETS

Test Step	Result / Action to Take
C1 REQUEST CONTINUOUS DTCs AND CARRY OUT THE DATC SELF-TEST	
• Key in ON position. • Request Continuous DTCs and carry out the DATC Module Self-Test. Record the DTCs displayed, if any. • **Were any DTCs displayed?**	**Yes** Record any DTCs displayed. GO to C3 . **No** GO to C2 .
C2 CHECK THE ACTUATOR DOOR AND LINKAGE	
• Inspect the actuator door and linkage for a binding or sticking condition. • **Was a condition found?**	**Yes** REPAIR the door or linkage. TEST the system for normal operation. **No** INSTALL a new DATC module. TEST the system for normal operation.
C3 CHECK THE DOOR ACTUATOR OPEN OPERATION	

• Key in OFF position. • Disconnect: DATC Module C228a. • Disconnect: DATC Module C228b. • Connect a fused jumper wire between DATC module C228a-14, circuit 29-FA10 (OG/GN), harness side and harness side of the connector/pin indicated below that corresponds to the recorded DTC(s).	**Yes** GO to C4 . **No** GO to C5 .

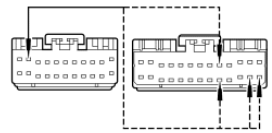
DTC	Pin	Circuit	Actuator/ Door
B1242	C228b-10	32-FB8 (WH/RD)	Air Recirculation
B1262	C228b-13	32-FB5 (WH/BK)	Defrost
B1263	C228b-24	32-FB7 (WH)	Panel Mode
B1264	C228b-22	32-FB6 (WH/VT)	Floor Mode



N0000825

• Connect a fused jumper wire between DATC module C228a-2, circuit 31-FA10 (BK), harness side and harness side of the connector/pin indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Actuator/ Door
B1242	C228b-9	33-FB8 (YE/RD)	Air Recirculation
B1262	C228b-26	33-FB5 (YE/BK)	Defrost
B1263	C228b-25	33-FB7 (YE)	Panel Mode
B1264	C228b-23	33-FB6 (YE/VT)	Floor Mode

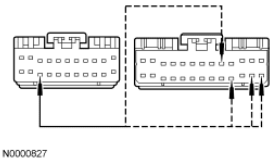


N0000826

• **Does the actuator motor move in the open direction?**

C4 CHECK THE DOOR ACTUATOR CLOSE OPERATION	
• Connect a fused jumper wire between DATC module C228a-14, circuit 29-FA10 (OG/GN), harness side and harness side of the connector/pin indicated below that corresponds to the recorded DTC(s).	**Yes** GO to C11 . **No** GO to C5 .

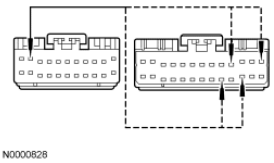
DTC	Pin	Circuit	Actuator/ Door
B1242	C228b-9	33-FB8 (YE/RD)	Air Recirculation
B1262	C228b-26	33-FB5 (YE/BK)	Defrost
B1263	C228b-25	33-FB7 (YE)	Panel Mode
B1264	C228b-23	33-FB6 (YE/VT)	Floor Mode



N0000827

- Connect a fused jumper wire between DATC module C228a-2, circuit 31-FA10 (BK), harness side and harness side of the connector/pin indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Actuator/ Door
B1242	C228b-10	32-FB8 (WH/RD)	Air Recirculation
B1262	C228b-13	32-FB5 (WH/BK)	Defrost
B1263	C228b-24	32-FB7 (WH)	Panel Mode
B1264	C228b-22	32-FB6 (WH/VT)	Floor Mode



N0000828

- **Does the actuator motor move in the closed direction?**

C5 CHECK ACTUATOR MOTOR OPEN CIRCUIT FOR A SHORT TO GROUND

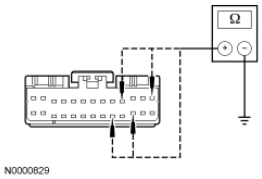
- Disconnect: Affected Actuator.
- Measure the resistance between the harness side of the connector/pin indicated below that corresponds to the recorded DTC(s) and ground.

DTC	Pin	Circuit
B1242	C228b-10	32-FB8 (WH/RD)
B1262	C228b-13	32-FB5 (WH/BK)

Yes
GO to C6 .

No
REPAIR the affected circuit for a short to ground. TEST the system for normal operation.

B1263	C228b-24	32-FB7 (WH)
B1264	C228b-22	32-FB6 (WH/VT)

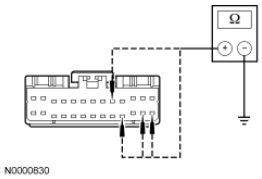


- **Is the resistance greater than 10,000 ohms?**

C6 CHECK ACTUATOR MOTOR CLOSE CIRCUIT FOR A SHORT TO GROUND

- Measure the resistance between the harness side of the connector/pin indicated below that corresponds to the recorded DTC(s) and ground.

DTC	Pin	Circuit
B1242	C228b-9	33-FB8 (YE/RD)
B1262	C228b-26	33-FB5 (YE/BK)
B1263	C228b-25	33-FB7 (YE)
B1264	C228b-23	33-FB6 (YE/VT)



- **Is the resistance greater than 10,000 ohms?**

Yes
GO to C7 .

No
REPAIR the affected circuit for a short to ground. TEST the system for normal operation.

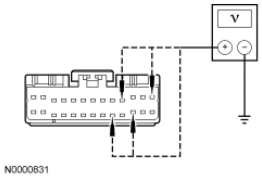
C7 CHECK ACTUATOR MOTOR OPEN CIRCUIT FOR A SHORT TO POWER

- Key in ON position.
- Measure the voltage between the harness side of the connector/pin indicated below that corresponds to the recorded DTC(s) and ground.

DTC	Pin	Circuit
B1242	C228b-10	32-FB8 (WH/RD)
B1262	C228b-13	32-FB5 (WH/BK)
B1263	C228b-24	32-FB7 (WH)
B1264	C228b-22	32-FB6 (WH/VT)

Yes
REPAIR the affected circuit for a short to power. TEST the system for normal operation.

No
GO to C8 .

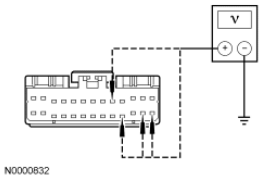


- **Is voltage present?**

C8 CHECK ACTUATOR MOTOR CLOSE CIRCUIT FOR A SHORT TO POWER

- Measure the voltage between the harness side of the connector/pin indicated below that corresponds to the recorded DTC(s) and ground.

DTC	Pin	Circuit
B1242	C228b-9	33-FB8 (YE/RD)
B1262	C228b-26	33-FB5 (YE/BK)
B1263	C228b-25	33-FB7 (YE)
B1264	C228b-23	33-FB6 (YE/VT)



- **Is voltage present?**

Yes
REPAIR the affected circuit for a short to power. TEST the system for normal operation.

No
GO to C9 .

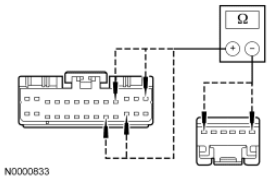
C9 CHECK ACTUATOR MOTOR OPEN CIRCUIT FOR AN OPEN

- Key in OFF position.
- Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Pin
B1242	C228b-10	32-FB8 (WH/RD)	C289-6
B1262	C228b-13	32-FB5 (WH/BK)	C232-6
B1263	C228b-24	32-FB7 (WH)	C236-6
B1264	C228b-22	32-FB6 (WH/VT)	C234-1

Yes
GO to C10 .

No
REPAIR the affected circuit for an open. TEST the system for normal operation.

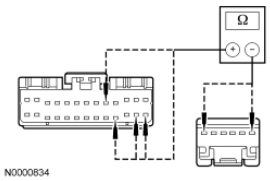


- **Is the resistance less than 5 ohms?**

C10 CHECK ACTUATOR MOTOR CLOSE CIRCUIT FOR AN OPEN

- Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Pin
B1242	C228b-9	33-FB8 (YE/RD)	C289-1
B1262	C228b-26	33-FB5 (YE/BK)	C232-1
B1263	C228b-25	33-FB7 (YE)	C236-1
B1264	C228b-23	33-FB6 (YE/VT)	C234-6



- **Is the resistance less than 5 ohms?**

Yes
INSPECT for binding or stuck linkage/door. If no condition is found, INSTALL a new door actuator. TEST the system for normal operation.

No
REPAIR the affected circuit for an open. TEST the system for normal operation.

C11 CHECK THE FEEDBACK POTENTIOMETER TOTAL RESISTANCE

- Connect: Affected Actuator.
- Disconnect: Actuators Not Affected.
- Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Pin	Circuit
B1242	C228a-11	9-FA1 (BN/RD)	C228a-22	7-FA1 (YE/RD)
B1262	C228b-17	9-FA2 (BN/RD)	C228a-22	7-FA1 (YE/RD)
B1263	C228b-17	9-FA2 (BN/RD)	C228a-22	7-FA1 (YE/RD)

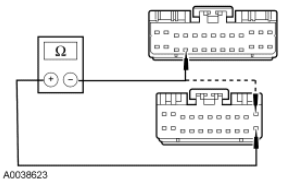
Yes
GO to C12 .

No
If the resistance is greater than 6,000 ohms, GO to C14 . If the resistance is less than 5,000 ohms, GO to C22 .

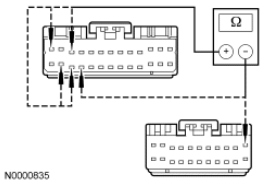


- **Is the resistance between 5,000 and 6,000 ohms?**

C12 CHECK POTENTIOMETER LOW SIDE RESISTANCE

- Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Pin	Circuit
B1242	C228a-11	9-FA1 (BN/RD)	C228b-15	8-FB8 (WH/RD)
B1262	C228b-17	9-FA2 (BN/RD)	C228b-1	8-FB5 (WH/BK)
B1263	C228b-17	9-FA2 (BN/RD)	C228b-3	8-FB7 (WH)
B1264	C228b-17	9-FA2 (BN/RD)	C228b-16	8-FB6 (WH/VT)



- **Is the resistance between 250 and 5,250 ohms?**

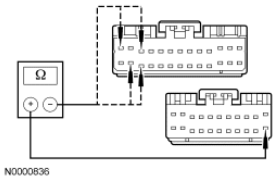
Yes
GO to C13 .

No
If the resistance is greater than 5,250 ohms, GO to C15 . If the resistance is less than 250 ohms, GO to C23 .

C13 CHECK POTENTIOMETER HIGH SIDE RESISTANCE

- Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the recorded DTC(s).

DTC	Pin	Circuit	Pin	Circuit
B1242	C228a-22	7-FA1 (YE/RD)	C228b-15	8-FB8 (WH/RD)
B1262	C228b-22	7-FA1 (YE/RD)	C228b-1	8-FB5 (WH/BK)
B1263	C228b-22	7-FA1 (YE/RD)	C228b-3	8-FB7 (WH)
B1264	C228b-22	7-FA1 (YE/RD)	C228b-16	8-FB6 (WH/VT)



- **Is the resistance between 250 and 5,250 ohms?**

Yes
GO to C17 .

No
If the resistance is greater than 5,250 ohms, GO to C14 . If the resistance is less than 250 ohms, GO to C24 .

C14 CHECK THE ACTUATOR REFERENCE CIRCUIT FOR AN OPEN	
• Disconnect: Affected Actuator. • Measure the resistance between the harness side of the connectors/pins indicated below that corresponds to the recorded DTC(s). **DTC / Pin / Circuit / Pin / Circuit** B1242 / C228a-22 / 7-FA1 (YE/RD) / C289-4 / 7-FB8 (YE/RD) B1262 / C228b-22 / 7-FA1 (YE/RD) / C232-4 / 7-FB5 (YE/BK) B1263 / C228b-22 / 7-FA1 (YE/RD) / C236-4 / 7-FB7 (YE) B1264 / C228b-22 / 7-FA1 (YE/RD) / C234-5 / 7-FB6 (YE/VT)  A0038626 • **Is the resistance less than 5 ohms?**	**Yes** GO to C15 . **No** REPAIR the affected circuit for an open. TEST the system for normal operation. **No** INSTALL a new door actuator. TEST the system for normal operation.

Pinpoint Test D: DTC B1251 OR DTC 1253 A/C In-Vehicle Temperature Sensor Open Circuit or Short to Ground

Normal Operation

Under normal operation, the in-vehicle temperature sensor receives a ground from the Dual Automatic Temperature Control (DATC) module through circuit 9-FA48 (BN/GN). A 5-volt reference voltage is supplied to the in-vehicle temperature sensor from the DATC module through circuit 8-FA48 (WH/GN)

Possible Causes

- An open in circuit 9-FA48 (BN/GN) or 8-FA48 (WH/GN).
- A short together in circuits 9-FA48 (BN/GN) and 8-FA48 (WH/GN).
- A short to ground in circuit 8-FA48 (WH/GN).
- DATC module.
- In-vehicle air temperature sensor.

PINPOINT TEST D: DTC B1251 OR DTC1253 A/C IN-VEHICLE TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
D1 CHECK THE SENSOR RESISTANCE	
• Key in OFF position. • Disconnect: In-Vehicle Temperature Sensor C233. • Measure the resistance between in-vehicle temperature sensor terminals.  • **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F) 37,000-58,000 ohms; 20-30°C (68-86°F) 24,000-37,000 ohms; 30-40°C (86-104°F) 16,000-24,000 ohms?**	**Yes** GO to D2 . **No** INSTALL a new in-vehicle temperature sensor. TEST the system for normal operation.
D2 CHECK THE DATC SENSOR OUTPUT VOLTAGE	
• Key in ON position. • Measure the voltage between in-vehicle temperature sensor C233, circuits 9-FA48 (BN/GN), harness side and 8-FA48 (WH/GN), harness side.  • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new in-vehicle temperature sensor. TEST the system for normal operation. If the code returns, INSTALL a new DATC module. TEST the system for normal operation. **No** If DTC B1253 is present, GO to D3 . If DTC B1251 is present, GO to D5 .
D3 CHECK CIRCUIT 8-FA48 (WH/GN) FOR A SHORT TO GROUND	

• Key in OFF position. • Disconnect: DATC Module C228a. • Disconnect: DATC Module C228b. • Measure the resistance between DATC module C228a-9, circuit 8-FA48 (WH/GN), harness side and ground.  A0001979 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to D4 . **No** REPAIR circuit 8-FA48 (WH/GN). TEST the system for normal operation.
D4 CHECK CIRCUIT 8-FA48 (WH/GN) FOR A SHORT TO CIRCUIT 9-FA48 (BN/GN)	
• Measure the resistance between in-vehicle temperature sensor C233, circuits 9-FA48 (BN/GN), harness side and 8-FA48 (WH/GN), harness side.  A0052122 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 8-FA48 (WH/GN) for a short to circuit 9-FA48 (BN/GN). TEST the system for normal operation.
D5 CHECK CIRCUIT 8-FA48 (WH/GN) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC Module C228a. • Measure the resistance between DATC module C228a-9, circuit 8-FA48 (WH/GN), harness side and the in-vehicle temperature sensor C233 circuit 8-FA48 (WH/GN), harness side.  A0001978 • **Is the resistance less than 5 ohms?**	**Yes** GO to D6 . **No** REPAIR circuit 8-FA48 (WH/GN). TEST the system for normal operation.
D6 CHECK CIRCUIT 9-FA48 (BN/GN) FOR AN OPEN	

• Disconnect: DATC Module C228b. • Measure the resistance between DATC pin C228b-14, circuit 9-FA48 (BN/GN), harness side and the in-vehicle temperature sensor C233 circuit 9-FA48 (BN/GN), harness side.  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 9-FA48 (BN/GN). TEST the system for normal operation.

Pinpoint Test E: Evaporator Or Heater Core Discharge Air Temperature Sensor Circuit Open Or Short To Ground

Normal Operation

Under normal operation, the LH and RH discharge temperature sensors receive a ground from the Dual Automatic Temperature Control (DATC) module through circuit (LH) 9-FA47 (BN/GN)/9-FA3 (BN/RD) and (RH) 9-FA51 (BN/YE)/9-FA3 (BN/RD). The evaporator discharge temperature sensor receives a ground from the DATC module through circuit 9-FA44 (BN/RD).

A 5-volt reference voltage is supplied to the LH and RH discharge temperature sensors from the DATC module through circuits (LH) 8-FA47 (WH/GN) and (RH) 8-FA51 (WH/BK). A 5-volt reference voltage is supplied to the evaporator discharge temperature sensor from the DATC module through circuit 8-FA44 (WH/RD).

Possible Causes

- An open in circuit 9-FA47 (BN/GN), 9-FA51 (BN/YE), 9-FA3 (BN/RD), 9-FA44 (BN/RD), 8-FA47 (WH/GN), 8-FA51 (WH/BK) or 8-FA44 (WH/RD).
- A short together in circuits 8-FA44 (WH/RD) and 9-FA44 (BN/RD), 8-FA51 (WH/BK) and 9-FA51 (BN/YE), 8-FA47 (WH/GN) and 9-FA47 (BN/GN).
- A short to ground in circuit 8-FA47 (WH/GN), 8-FA51 (WH/BK) or 8-FA44 (WH/RD).
- LH discharge temperature sensor.
- RH discharge temperature sensor.
- Evaporator discharge temperature sensor.
- DATC module.

PINPOINT TEST E: EVAPORATOR OR HEATER CORE DISCHARGE AIR TEMPERATURE SENSOR CIRCUIT OPEN OR SHORT TO GROUND

NOTE: Evaporator core, driver side heater core and passenger side heater core discharge air temperature sensors have the same diagnostic procedure.

Test Step	Result / Action to Take
E1 CHECK THE SENSOR RESISTANCE	

<table>
<tr>
<td>
• Key in OFF position.
• Disconnect: Sensor.
• Refer to the table and disconnect the sensor associated with the DTCs recorded from the DATC module self-test:

<table>
<tr><th>Sensor</th><th>Condition</th><th>DTC</th><th>Connector</th></tr>
<tr><td>EVAP air discharge</td><td>Open</td><td>B1946</td><td>C296</td></tr>
<tr><td>EVAP air discharge</td><td>Short</td><td>B1947</td><td>C296</td></tr>

</tr>
<tr><td colspan="2">E3 CHECK THE REFERENCE CIRCUIT FOR AN OPEN</td></tr>
</table>

• Key in OFF position. • Disconnect: DATC Module C228a. • Refer to the following chart and measure the resistance of the reference circuit between DATC module C228a and the sensor connector. **Sensor / Connector / Circuit / DATC C228a Pin** Veep Discharge / C296 / 8-FA44 (WH/RD) / 10 Passenger Side / C255 / 8-FA51 (WH/BK) / 6 Driver / C235 / 8-FA47 (WH/GN) / 18  • **Is the resistance less than 5 ohms?**	**Yes** GO to E4 . **No** REPAIR the affected circuit. TEST the system for normal operation.
E4 CHECK RETURN CIRCUIT FOR AN OPEN	
• Refer to the following chart and measure the resistance of the return circuit between sensor and DATC module C228a for an open. **Sensor Connector / DATC Module C228a Pin / Circuit** Evap/C296 / 16 / 9-FA44 (BN/RD) Passenger/ C255 / 19 / 9-FA51 (BN/YE) Driver/C235 / 19 / 9-FA47 (BN/GN)  • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR the affected circuit. TEST the system for normal operation.

E5 CHECK THE REFERENCE CIRCUIT FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: DATC Module C228a. • Refer to the following chart and measure the resistance of the sensor reference circuit between DATC module C228a and ground. **Temperature Sensor** / **DATC Module C228a Pin** / **Circuit** Evaporator Core / 10 / 8-FA44 (WH/RD) Passenger / 6 / 8-FA51 (WH/BK) Driver / 18 / 8-FA47 (WH/GN)  A0004764 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to E6 . **No** REPAIR the affected circuit. TEST the system for normal operation.
E6 CHECK THE REFERENCE CIRCUITS FOR A SHORT TO THE RETURN CIRCUITS	
• Refer to the following chart and measure the resistance between temperature sensor harness side circuits. **Connector** / **Circuit** / **Circuit** C296 / 8-FA44 (WH/RD) / 9-FA44 (BN/RD) C255 / 8-FA51 (WH/BK) / 9-FA51 (BN/YE) C235 / 8-FA47 (WH/GN) / 9-FA47 (BN/GN)  A0052122 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR the reference circuit for a short to the return circuit. TEST the system for normal operation.

Pinpoint Test F: DTC B1255 OR DTC B1257 A/C Ambient Temperature Sensor Open Circuit or Short to Ground

Normal Operation

Under normal operation, the ambient air temperature sensor receives a ground from the Dual Automatic Temperature Control (DATC) module through circuit 9-FA49 (BN/WH). A 5-volt reference voltage is supplied to the ambient air temperature sensor from the DATC module through circuit 8-FA49 (WH/VT).

Possible Causes

- An open in circuit 9-FA49 (BN/WH) or 8-FA49 (WH/VT).
- A short to together in circuits 9-FA49 (BN/WH) and 8-FA49 (WH/VT).
- A short to ground in circuit 8-FA49 (WH/VT).
- Ambient air temperature sensor.
- DATC module.

PINPOINT TEST F: DTC B1255 OR DTC B1257 A/C AMBIENT TEMPERATURE SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
F1 CHECK THE AMBIENT TEMPERATURE SENSOR RESISTANCE	
• Key in OFF position. • Disconnect: Ambient Temperature Sensor C132. • Measure the resistance between ambient temperature sensor terminals.  A0002817 • **Is the resistance within the specified values for these temperature ranges: 10-20°C (50-68°F) 37,000-58,000 ohms; 20-30°C (68-86°F) 24,000-37,000 ohms; 30-40°C (86-104°F) 16,000-24,000 ohms?**	**Yes** GO to F2 . **No** INSTALL a new A/C ambient air temperature sensor. TEST the system for normal operation.
F2 CHECK THE DATC SENSOR OUTPUT VOLTAGE	
• Key in ON position. • Measure the voltage between ambient temperature sensor C132, circuits 8-FA49 (WH/VT), harness side and 9-FA49 (BN/WH), harness side.  A0002818 • **Is the voltage between 4.7 and 5.1 volts?**	**Yes** INSTALL a new A/C ambient air temperature sensor. TEST the system for normal operation. If the code returns, INSTALL a new DATC module. TEST the system for normal operation. **No** If DTC B1255, GO to F3 . If DTC B1257, GO to F5 .

F3 CHECK CIRCUIT 8-FA49 (WH/VT) FOR AN OPEN	
• Key in OFF position. • Disconnect: DATC Module C228a. • Measure the resistance between DATC module C228a-17, circuit 8-FA49 (WH/VT), harness side and ambient temperature sensor connector C132 circuit 8-FA49 (WH/VT), harness side.  A0006706 • **Is the resistance less than 5 ohms?**	**Yes** GO to F4 . **No** REPAIR circuit 8-FA49 (WH/VT). TEST the system for normal operation.
F4 CHECK CIRCUIT 9-FA49 (BN/WH) FOR AN OPEN	
• Measure the resistance between DATC module C228a-8, circuit 9-FA49 (BN/WH), harness side and the ambient temperature sensor connector C132 circuit 9-FA49 (BN/WH), harness side.  A0006705 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 9-FA49 (BN/WH). TEST the system for normal operation.
F5 CHECK CIRCUIT 8-FA49 (WH/VT) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: DATC Module C228a. • Measure the resistance between DATC module C228a-17, circuit 8-FA49 (WH/VT), harness side and ground.  A0001983 • **Is the resistance greater than 10,000 ohms?**	**Yes** GO to F6 . **No** REPAIR circuit 8-FA49 (WH/VT) for a short to ground. TEST the system for normal operation.
F6 CHECK CIRCUIT 8-FA49 (WH/VT) FOR A SHORT TO CIRCUIT 9-FA49 (BN/WH)	

• Measure the resistance between ambient temperature sensor C132, circuits 8-FA49 (WH/VT), harness side and 9-FA49 (BN/WH), harness side.  A0038068 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 8-FA49 (WH/VT) for a short to circuit 9-FA49 (BN/WH). TEST the system for normal operation.

Pinpoint Test G: DTC B1259 OR DTC B1261 Solar Radiation Sensor Open Circuit or Short to Ground

Normal Operation

Under normal operation, the solar radiation sensor receives a ground through circuit 31-LE42 (BK/OG). A 5-volt reference voltage is supplied to the solar radiation sensor from the DATC module through circuits 8-FA53 (WH/BL) and 10-FA53 (GY/VT).

Possible Causes

- An open in circuit 31-LE42 (BK/OG), 8-FA53 (WH/BL) or 10-FA53 (GY/VT).
- A short together in circuits 9-FA48 (BN/GN) and 8-FA48 (WH/GN) or 9-FA48 (BN/GN) and 10-FA53 (GY/VT).
- A short to ground in circuit 8-FA53 (WH/BL) or10-FA53 (GY/VT).
- Solar radiation sensor.
- DATC module.

PINPOINT TEST G: DTC B1259 OR DTC B1261 SOLAR RADIATION SENSOR OPEN CIRCUIT OR SHORT TO GROUND

Test Step	Result / Action to Take
G1 CHECK THE SOLAR RADIATION SENSOR RESISTANCE	
• Key in OFF position. • Disconnect: Solar Radiation Sensor C286. • Measure the resistance between solar radiation sensor terminals 1 and 5 and between 5 and 6, component side.  A0032464 • **Is continuity present and the resistance greater than 0 ohms?**	**Yes** GO to G2 . **No** INSTALL a new solar radiation sensor. TEST the system for normal operation.

G2 CHECK THE SOLAR RADIATION SENSOR REFERENCE VOLTAGE	
• Key in ON position. • Press the AUTOMATIC button. • Measure the voltage between solar radiation sensor C286-1, circuit 8-FA53 (WH/BL) and C286-5, circuit 31-LE42 (BK/OG).  A0015935 • Measure the voltage between solar radiation sensor C286-5, circuit 31-LE42 (BK/OG) and C286-6, circuit 10-FA53 (GY/VT).  N0006512 • **Are the voltages between 4.7 and 5.1 volts?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** If diagnosing DTC 1261, GO to G3 . If diagnosing DTC 1259, GO to G5 .
G3 CHECK CIRCUIT 31-LE42 (BK/OG) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between solar radiation sensor C286-5, circuit 31-LE42 (BK/OG) and ground.  A0015937 • **Is the resistance less than 5 ohms?**	**Yes** GO to G4 . **No** REPAIR circuit 31-LE42 (BK/OG) for an open. TEST the system for normal operation.
G4 CHECK CIRCUIT 8-FA53 (WH/BU) OR CIRCUIT 10-FA53 (GY/VT) FOR AN OPEN	
• Disconnect: DATC Module C228a. • Measure the resistance between DATC module C228a-7, circuit 8-FA53 (WH/BU) and solar radiation sensor C286-1, circuit 8-FA53 (WH/BU).	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR the circuit for an open. TEST the system for normal operation.

 N0006514 • Measure the resistance between DATC module C228a-20, circuit 10-FA53 (GY/VT) and solar radiation sensor C286-6, circuit 10-FA53 (GY/VT).  N0006513 • **Is the resistance less than 5 ohms?**	
G5 CHECK CIRCUIT 8-FA53 (WH/BU) FOR A SHORT TO CIRCUIT 31-LE42 (BK/OG)	
• Key in OFF position. • Disconnect: DATC Module C228a. • Measure the resistance between solar radiation sensor C286-1, circuit 8-FA53 (WH/BU) and circuit C286-5, 31-LE42 (BK/OG).  A0047078 • Measure the resistance between solar radiation sensor C286-6, circuit 10-FA53 (GY/VT) and circuit C286-5, 31-LE42 (BK/OG).  A0047079 • **Are the resistances greater than 10,000 ohms?**	**Yes** GO to G6 . **No** REPAIR circuit 8-FA53 (WH/BU) and 10-FA53 (GY/VT) for a short. TEST the system for normal operation.
G6 CHECK CIRCUIT 8-FA53 (WH/BU) OR CIRCUIT 10-FA53 (GY/VT) FOR A SHORT TO GROUND	
• Measure the resistance between solar radiation sensor C286-1, circuit 8-FA53-(WH/BU) and ground.	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 8-FA53 (WH/BU) or 10-FA53 (GY/VT) for a short to ground. TEST the system for normal operation.

 A0015938 • Measure the resistance between solar radiation sensor C286-6, circuit 10-FA53 (GY/VT) and ground.  A0032467 • **Are the resistances greater than 10,000 ohms?**	

Pinpoint Test H: Insufficient, Erratic or No Heat

Normal Operation

Under normal operation, the coolant control valve receives battery voltage through circuit 30-FB3 (RD/OG). The coolant control valve is provided a ground through circuit 91S-FB3 (BN/BL) and/or 91S-FB4 (BN/GN) from the Dual Automatic Temperature Control (DATC) module, depending on which side of the heater core warm coolant is to flow through.

Possible Causes

- An open in circuit 30-FB3 (RD/OG), 91S-FB3 (BN/BL) or 91S-FB4 (BN/GN).
- A short to ground or voltage in circuit 91S-FB3 (BN/BL) or 91S-FB4 (BN/GN).
- Coolant control valve.
- DATC module.
- Evaporator discharge air temperature sensor.
- Thermostat.

PINPOINT TEST H: INSUFFICIENT, ERRATIC, OR NO HEAT

Test Step	Result / Action to Take
H1 CHECK FOR CORRECT COOLANT LEVEL	
• Key in OFF position. • Check the engine coolant level with the engine at cold and hot temperatures. • **Is the engine coolant at the correct level (both cold and hot)?**	**Yes** GO to H4 . **No** GO to H2 .
H2 CHECK THE ENGINE COOLING SYSTEM FOR LEAKS	
⚠ WARNING: Never remove the pressure relief cap under any condition while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine, or can result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle.	**Yes** GO to H3 . **No** REPAIR the engine cooling system leak. TEST the system for

Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, use the cloth to remove the pressure relief cap. • Fill and bleed the engine cooling system. • Pressure check the engine cooling system, including the pressure relief cap. • **Does the engine cooling system, including the pressure relief cap, hold pressure?**	normal operation.
H3 VERIFY THE FAULT WAS A LOW ENGINE COOLANT LEVEL	
NOTE: When carrying out this test step, allow time for the system to respond. • With the engine at normal operating temperature, set the DATC module driver and passenger side temperature settings to full hot (32°C [90°F]) and note the discharge air temperature. • **Is the discharge air temperature at full hot?**	**Yes** Test is complete. **No** GO to H4 .
H4 BLEED THE ENGINE COOLING SYSTEM	
⚠ **WARNING: Never remove the pressure relief cap under any condition while the engine is operating. Failure to follow these instructions can result in damage to the cooling system or engine, or can result in personal injury. To avoid having scalding hot coolant or steam blow out of the cooling system, use extreme care when removing the pressure relief cap from a hot degas bottle. Wait until the engine has cooled, then wrap a thick cloth around the pressure relief cap and turn it slowly one turn (counterclockwise). Step back while the pressure is released from the cooling system. When certain all the pressure has been released, use the cloth to remove the pressure relief cap. NOTE:** When carrying out this test step, allow time for the system to respond. • Bleed the engine cooling system. • With the engine at normal operating temperature, set the DATC module driver and passenger side temperature settings to full hot (32°C [90°F]) and note the discharge air temperature. • **Is the discharge air temperature at full hot?**	**Yes** Test is complete. **No** GO to H5 .
H5 CHECK FOR HOT COOLANT AT THE HEATER CORE INLET HOSES	
⚠ **WARNING: The heater core inlet hoses will become too hot to handle and can cause serious burns if the system is working correctly. Failure to follow these instructions can result in personal injury.** • Key in ON position. • With the engine running, carefully feel both heater core inlet hoses.	**Yes** CARRY OUT the heater core component test. REFER to Heater Core under Component Tests in this section to determine whether a plugged or partially plugged condition exists. **No** GO to H6 .

 A0024800 • **Are both heater core inlet hoses too hot to handle?**	
H6 CHECK THE COOLANT CONTROL VALVE INLET HOSE	
⚠ **WARNING: The coolant control valve inlet hose will become too hot to handle and can cause serious burns if the system is working correctly. Failure to follow these instructions can result in personal injury.** • Carefully feel both heater core inlet hoses. • **Is the coolant control valve inlet hose too hot to handle?**	**Yes** GO to H7 . **No** INSTALL a new thermostat. TEST the system for normal operation.
H7 CHECK DATC DTCS	
• Check the DATC for DTCs. • **Is DTC B2798 or B2800 present?**	**Yes** GO to H10 . **No** GO to H8 .
H8 CHECK CIRCUITS 91S-FB4 (BN/GN) AND 91S-FB3 (BN/BU) FOR GROUND	
• Key in OFF position. • Disconnect: Coolant Control Valve C1034. • Key in ON position. • Set the DATC module driver and passenger side temperature settings to full hot. • Measure the voltage between coolant control valve C1034-2, circuit 30-FB3 (RD/OG) and: ♦ coolant control valve C1034-1, circuit 91S-FB4 (BN/GN). ♦ coolant control valve C1034-3, circuit 91S-FB3 (BN/BU).  A0083826 • **Is voltage present?**	**Yes** GO to H9 . **No** INSTALL a new coolant control valve. TEST the system for normal operation.
H9 CHECK CIRCUITS 91S-FB4 (BN/GN) AND 91S-FB3 (BN/BU) FOR A SHORT TOGETHER	
• Key in OFF position. • Disconnect: DATC Module C228b. • Measure the resistance between coolant control valve C1034-1, circuit 91S-FB4 (BN/GN) and C1034-3, circuit 91S-FB3 (BN/BU).	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 91S-FB4 (BN/GN) for a short to circuit 91S-FB3

 A0083827 • **Is the resistance greater than 10,000 ohms?**	(BN/BU). TEST the system for normal operation.
H10 CHECK CIRCUITS 91S-FB4 (BN/GN) AND 91S-FB3 (BN/BU) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: DATC Module C228b. • Disconnect: Coolant Control Valve C1034. • Measure the resistance between ground and: ♦ coolant control valve C1034-1, circuit 91S-FB4 (BN/GN). ♦ coolant control valve C1034-3, circuit 91S-FB3 (BN/BU).  A0083828 • **Are the resistances greater than 10,000 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 91S-FB4 (BN/GN) or circuit 91S-FB3 (BN/BU) for a short to ground. TEST the system for normal operation.

Pinpoint Test I: Insufficient Heat During Engine Idle 3.9L Engine

Normal Operation

Under normal operation, the auxiliary coolant pump relay coil receives a ground from the Dual Automatic Temperature Control (DATC) module through circuit 91S-FA76 (BN/BL). The Coil receives battery voltage through circuit 30-FA74 (RD/GN). Battery voltage is supplied to the relay contacts from circuit 30-FA74 (RD/GN). When the relay coil is energized, voltage is delivered to the auxiliary coolant pump motor through circuit 30S-FB1 (RD/YE). Ground for the motor is provided through circuit 31-FB1 (BK/YE).

Possible Causes

- An open in circuit 31-FB1 (BK/YE), 30-FA74 (RD/GN), 30S-FB1 (RD/YE) or 91S-FA76 (BN/BL).
- A short to voltage in circuit 91S-FA76 (BN/BL).
- Auxiliary coolant pump relay.
- Auxiliary coolant pump motor.
- DATC module.

PINPOINT TEST I: INSUFFICIENT HEAT DURING ENGINE IDLE 3.9L ENGINE

Test Step	Result / Action to Take
I1 CARRY OUT THE DATC MODULE SELF-TEST	
• Key in ON position. • Carry out the DATC module self-test and retrieve continuous DTCs. Refer to Climate Control System . Record the DTCs displayed, if any. • **Are any DTCs displayed?**	**Yes** REFER to the DATC Module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as necessary. **No** GO to I2 .

I2 RECHECK DATC MODULE CONFIGURATION	
• Enter Module Identification mode. • Enter the following diagnostic mode on the diagnostic tool: PID CNFG Data. • **Does the data read 4N_3N_2Y?**	**Yes** GO to I3 . **No** RECONFIGURE the DATC module.
I3 CHECK THE COOLANT LEVEL	
• Check the coolant level with the engine at hot and cold temperatures. • **Is the engine coolant at the correct level (hot and cold)?**	**Yes** GO to I4 . **No** REFILL the system and PRESSURE TEST for leaks. In addition, if the coolant level had dropped below the "MIN" level, SET the system to MAX heat and RUN the engine at 3,000 rpm for 3 to 5 minutes until hot air blows from the outlets. RECHECK coolant level.GO to I4 .
I4 CHECK FOR AUXILIARY COOLANT PUMP OPERATION	
• Connect the diagnostic tool. • Key in ON position. • In the active command mode, request Climate Control System and select Pump/VCB or set driver side temperature to 32°C (90°F). • **Can the auxiliary cooling pump be heard running or be felt running?**	**Yes** System is operating correctly. **No** GO to I5 .
I5 CHECK THE AUXILIARY PUMP MOTOR	
• Key in OFF position. • Disconnect: Auxiliary Coolant Pump C163. • Key in ON position. • Make sure the active command Pump/VBC is still selected or the driver side temperature is set to 32°C (90°F). • Measure the voltage between auxiliary coolant pump C163, circuit 30S-FB1 (RD/YE), harness side and circuit 31-FB1 (BK), harness side.  A0002330 • **Is the voltage greater than 10 volts?**	**Yes** INSPECT terminals for damage and correct installation. If pins are installed correctly, INSTALL a new auxiliary coolant pump. TEST the system for normal operation. **No** GO to I6 .
I6 CHECK CIRCUIT 31-FB1 (BK) FOR AN OPEN	

• Measure the resistance between auxiliary coolant pump C163, circuit 31-FB1 (BK), harness side and ground.  A0002331 • **Is the resistance less than 5 ohms?**	**Yes** GO to I7 . **No** REPAIR circuit 31-FB1 (BK). TEST the system for normal operation.
I7 CHECK THE AUXILIARY COOLANT PUMP RELAY	
• Key in OFF position. • Disconnect: Auxiliary Coolant Pump Relay C1005. • Measure the voltage between CJB auxiliary coolant pump relay pins 2 and 5, circuit 30-FA74A (RD), harness side and ground.  A0006707 • **Is the voltage greater than 10 volts?**	**Yes** GO to I8 . **No** REPAIR circuit 30-FA74A (RD). TEST the system for normal operation.
I8 CARRY OUT THE RELAY COMPONENT TEST	
• Carry out the relay component test. Refer to Wiring Diagrams Cell 149 for schematic and connector information. • **Is the relay OK?**	**Yes** GO to I9 . **No** INSTALL a new auxiliary coolant pump relay. TEST the system for normal operation.
I9 CHECK CIRCUIT 30S-FB1 (RD/YE) FOR AN OPEN	
• Disconnect: Auxiliary Coolant Pump Relay C1005. • Measure the resistance between auxiliary coolant pump C163, circuit 30S-FB1 (RD/YE), harness side and auxiliary coolant pump relay pin 3, circuit 30S-FB1 (RD/YE), harness side.  A0002334	**Yes** GO to I10 . **No** REPAIR circuit 30S-FB1 (RD/YE). TEST the system for normal operation.

• **Is the resistance less than 5 ohms?**	
I10 CHECK THE DATC MODULE	
• Key in OFF position. • Connect: Auxiliary Coolant Pump Relay C1005. • Connect: Auxiliary Coolant Pump C163. • Disconnect: DATC Module C228a. • Disconnect: DATC Module C228b. • Connect a fused jumper wire between DATC module C228b-18, circuit 91S-FA76 (BN/BU), harness side and DATC module C228a-2, circuit 31-FA10 (BK), harness side.  A0002332 • **Does the auxiliary coolant pump motor operate?**	**Yes** INSPECT all connectors and terminals, RECONNECT the connectors, and TEST the system for normal operation. If condition still exists, INSTALL a new DATC module. TEST the system for normal operation. **No** GO to I11 .
I11 CHECK CIRCUIT 91S-FA76 (BK/OG) FOR A SHORT TO POWER	
NOTE: If a short to power is found, it is necessary to install a new DATC module. • Disconnect: Auxiliary Coolant Pump Relay C1005. • Measure the voltage between auxiliary coolant pump relay pin 2, circuit 91S-FA76 (BK/OG), harness side and ground.  A0002333 • **Is any voltage present?**	**Yes** REPAIR circuit 91S-FA76 (BK/OG). INSTALL a new DATC module. TEST the system for normal operation. **No** GO to I12 .
I12 CHECK CIRCUIT 91S-FA76 (BK/OG) FOR AN OPEN	
• Measure the resistance between auxiliary coolant pump relay circuit 91S-FA76 (BK/OG), harness side and DATC module C228b-18, circuit 91S-FA76 (BK/OG), harness side.	**Yes** INSPECT all connectors and terminals, RECONNECT the connectors and TEST the system. If condition still exists, INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 91S-FA76 (BK/OG). TEST the system for normal operation.

 A0003989 • **Is the resistance less than 5 ohms?**	

Pinpoint Test J: Full Heat Only In All Modes

Normal Operation

Under normal operation, the coolant control valve receives battery voltage through circuit 30-FB3 (RD/OG)/30-FA1 (RD). The coolant control valve is provided a ground through circuit 91S-FB3 (BN/BL) and/or 91S-FB4 (BN/GN) from the Dual Automatic Temperature Control (DATC) module, depending on which side of the heater core the warm coolant is to flow through.

Under normal operation, the auxiliary coolant pump relay coil receives a ground from the Dual Automatic Temperature Control (DATC) module through circuit 91S-FA76 (BN/BL). The Coil receives battery voltage through circuit 30-FA74 (RD/GN). Battery voltage is supplied to the relay contacts from circuit 30-FA74 (RD/GN). When the relay coil is energized, voltage is delivered to the auxiliary coolant pump motor through circuit 30S-FB1 (RD/YE). Ground for the motor is provided through circuit 31-FB1 (BK/YE).

Possible Causes

- An open in circuit 30-FB3 (RD/OG)/30-FA1 (RD), 91S-FB3 (BN/BL) or 91S-FB4 (BN/GN).
- A short to ground or voltage in circuit 91S-FB3 (BN/BL) or 91S-FB4 (BN/GN).
- A short to voltage in circuit 91S-FB3 (BN/BL) or 91S-FB4 (BN/GN).
- Coolant control valve.
- Evaporator discharge air temperature sensor.
- DATC module.

PINPOINT TEST J: FULL HEAT ONLY IN ALL MODES

Test Step	Result / Action to Take
J1 CHECK DATC DTCS	
• Check the DATC for DTCs. • **Is DTC B2797 or B2799 present?**	**Yes** GO to J3 . **No** GO to J2 .
J2 CHECK CIRCUITS 91S-FB4 (BN/GN) AND 91S-FB3 (BN/BU) FOR GROUND	
• Key in OFF position. • Disconnect: Coolant Control Valve C1034. • Key in ON position. • Set the DATC module driver and passenger side temperature settings to full Cool. • Measure the voltage between coolant control valve C1034-2, circuit 30-FB3 (RD/OG) and: ♦ coolant control valve C1034-1, circuit 91S-FB4 (BN/GN).	**Yes** INSTALL a new coolant control valve. TEST the system for normal operation. **No** INSTALL a new DATC module. TEST the system for normal operation.

♦ coolant control valve C1034-3, circuit 91S-FB3 (BN/BU).  A0083826 • **Is voltage present?**	
J3 CHECK CIRCUIT 30-FB3 (RD/OG) FOR VOLTAGE	
• Key in OFF position. • Disconnect: Coolant Control Valve C1034. • Key in ON position. • Measure the voltage between ground and coolant control valve C1034-2, circuit 30-FB3 (RD/OG).  A0083829 • **Is the voltage greater than 10 volts?**	**Yes** GO to J4 . **No** REPAIR circuit 30-FB3 (RD/OG) for an open. TEST the system for normal operation.
J4 CHECK CIRCUITS 91S-FB4 (BN/GN) AND 91S-FB3 (BN/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: DATC Module C228b. • Key in ON position. • Measure the voltage between ground and: ♦ coolant control valve C1034-1, circuit 91S-FB4 (BN/GN). ♦ coolant control valve C1034-3, circuit 91S-FB3 (BN/BU).  A0083830 • **Is voltage present?**	**Yes** REPAIR circuit 91S-FB4 (BN/GN) or 91S-FB3 (BN/BU) for a short to voltage. TEST the system for normal operation. **No** GO to J5 .
J5 CHECK CIRCUITS 91S-FB4 (BN/GN) OR 91S-FB3 (BN/BU) FOR AN OPEN	
• Key in OFF position. • **NOTE:** DTC B2797 only. • Measure the resistance between coolant control valve C1034-1, circuit 91S-FB4 (BN/GN) and DATC module C228b-6, circuit 91S-FB4	**Yes** CARRY OUT the coolant control valve component test in this section. If OK, INSTALL a new DATC module. TEST the system for normal operation.

(BN/GN).  A0083831 • **NOTE:** DTC B2799 only. • Measure the resistance between coolant control valve C1034-3, circuit 91S-FB3 (BN/BU) and DATC module C228b-5, circuit 91S-FB3 (BN/BU).  A0083832 • **Are the resistances less than 5 ohms?**	**No** REPAIR circuit 91S-FB4 (BN/GN) or 91S-FB3 (BN/BU) for an open. TEST the system for normal operation.

Pinpoint Test K: The Dual Temperature Control Is Inoperative/Does Not Operate Correctly

Normal Operation

Under normal operation, the LH and RH discharge temperature sensors receive a ground from the Dual Automatic Temperature Control (DATC) module through circuit (LH) 9-FA47 (BN/GN)/9-FA3 (BN/RD) and (RH) 9-FA51 (BN/YE)/9-FA3 (BN/RD). A 5-volt reference voltage is supplied to the LH and RH discharge temperature sensors from the DATC module through circuits (LH) 8-FA47 (WH/GN) and (RH) 8-FA51 (WH/BK).

Possible Causes

- An open in circuit 9-FA47 (BN/GN) or 9-FA51 (BN/YE)
- DATC module.

PINPOINT TEST K: THE DUAL TEMPERATURE CONTROL IS INOPERATIVE/DOES NOT OPERATE CORRECTLY

Test Step	Result / Action to Take
K1 VERIFY THE CONCERN	
NOTE: When carrying out this test step, allow time for the system to respond. • With the engine at normal operating temperature, select PANEL mode and A/C on the DATC module. • Using the driver side temperature control, set the driver side temperature to 16°C (60°F) and then set to 32°C (90°F). • **Do both the driver side and passenger side air temperatures go to full cool then to full heat?**	**Yes** GO to K2 . **No** If driver or passenger side only does not go to full cool and then full heat,GO to K6 .
K2 CHECK MODULE CONFIGURATION	

• Enter Module Identification mode. • Enter the following diagnostic mode on the diagnostic tool: PID CNFG Data. • **Does PID CNFG data read ON and 4N_3N_2Y?**	**Yes** GO to K3 . **No** RECONFIGURE the DATC module.
K3 REQUEST CONTINUOUS CODES AND CARRY OUT THE DATC SELF-TEST	
• Request Continuous DTCs and carry out the DATC Module Self-Test. Refer to Climate Control System . Record the DTCs displayed, if any. • **Are any DTCs displayed?**	**Yes** REFER to the DATC Module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as necessary. **No** GO to K4 .
K4 CHECK THE TEMPERATURE SENSORS FOR CORRECT INSTALLATION	
• Key in OFF position. • Check the driver side, passenger side, evaporator core and ambient air temperature sensors for correct installation. • Check the in-vehicle temperature sensor and venturi hose for correct installation. • **Are the sensors installed correctly?**	**Yes** GO to K5 . **No** CORRECT the sensor installation. TEST the system for normal operation.
K5 CHECK FOR CORRECT HEATER HOSE CONNECTIONS	
NOTE: The hose assembly that connects to the inboard port on the coolant control valve connects to the inboard port (driver side) on the heater core. • Check the heater hose connections for correct installation. • **Are the heater hoses installed correctly?**	**Yes** GO to K6 . **No** CORRECT the heater hose installation. TEST the system for normal operation.
K6 CHECK FOR CORRECT COOLANT FLOW TO THE HEATER CORE	
⚠ **WARNING: The heater core inlet hoses will become too hot to handle and can cause serious burns if the system is working correctly. Failure to follow these instructions can result in personal injury.** • Remove the passenger side cowl cover. • With the engine running at normal operating temperature and the DATC module set to 32°C (90°F), see if both inlet heater hoses are too hot to handle. • **Are both inlet heater hoses too hot to handle?**	**Yes** GO to K7 . **No** Go To Pinpoint Test H .
K7 CHECK CORRECT COOLANT CONTROL VALVE OPERATION	

• Remove the passenger side cowl cover. • Clamp off the three heater hoses going to the heater core, as close to the heater core as possible.  A0000938 • Key in ON position. • With the engine running, set the DATC module to 16°C (60°F). • **Is cooling restored?**	**Yes** Concern is with coolant control valve operation. Go To Pinpoint Test J . **No** GO to K8 .
K8 CHECK CIRCUITS 8-FA51 (WH/BK) AND 8-FA47 (WH/GN)	
• Key in OFF position. • Disconnect: Passenger Side Discharge Air Temperature Sensor C255. • Disconnect: Driver Side Discharge Air Temperature Sensor C235. • Disconnect: DATC Module C228a. • Measure the resistance between passenger side discharge air temperature sensor C255, circuit 8-FA51 (WH/BK) and DATC module C228a-6, circuit 8-FA51 (WH/BK).  A0004988 • Measure the resistance between driver side discharge air temperature sensor C235, circuit 8-FA47 (WH/GN) and DATC module C228a-18, circuit 8-FA47 (WH/GN).  A0004987 • **Are the resistances less than 5 ohms?**	**Yes** RECHECK all connections, RECONNECT and RETEST the system. If the condition still exists, INSTALL a new DATC module. TEST the system for normal operation. **No** CHECK to make sure that circuit 8-FA47 (WH/GN) is connected to DATC module C228a-6 and that circuit 8-FA51 (WH/BK) is connected to DATC module C228b-18. REPAIR as required. TEST the system for normal operation.

Pinpoint Test L: The A/C Does Not Operate/Does Not Operate Correctly

Normal Operation

Under normal operation, when the Powertrain Control Module (PCM) receives an A/C request signal from the DATC module, the PCM provides a ground for the A/C clutch relay coil through circuit 91S-FA79 (BN/BL). The A/C clutch relay coil receives ignition voltage through circuit 15S-FA79 (GN/RD). The relay switch

receives battery voltage through circuit 30-FA79 (RD/OG). When the relay coil is grounded, voltage is delivered through circuit 15-FA6 (GN/YE) to the A/C compressor clutch field coil. Ground for the A/C compressor clutch field coil is provided through circuit 31-FA6 (BK/YE).

Possible Causes

- An open in circuit 31-FA6 (BK/YE), 30S-FA79 (RD), 91S-FA79 (BN/BL), 15S-FA79 (GN/RD) or 15-FA6 (GN/YE).
- A short to voltage in circuit 91S-FA79 (BN/BL).
- A/C clutch relay.
- A/C compressor clutch/field coil.
- DATC module.
- Evaporator discharge air temperature sensor.
- PCM

PINPOINT TEST L: THE A/C DOES NOT OPERATE/DOES NOT OPERATE CORRECTLY

NOTE: The ambient temperature must be above 0°C (32°F) to permit the A/C compressor to operate.

NOTE: Before carrying out the following test, diagnose any PCM DTCs.

NOTE: Before carrying out the following test, make sure that the A/C system pressure is above 290 kPa (42 psi). If the pressure is below 290 kPa (42 psi), refer to Fluorescent Dye Leak Detection in this section.

Test Step	Result / Action to Take
L1 CHECK THE A/C PRESSURE PCM PID	
• Key in ON position. • Enter the following diagnostic mode on the diagnostic tool: A/C Pressure PCM PID. • With the manifold gauge set connected, compare the pressure readings of the manifold gauge set and the A/C pressure PID. • **Are the pressure values of the manifold gauge set and the A/C pressure PID similar?**	**Yes** GO to L2 . **No** INSTALL a new A/C pressure transducer. TEST the system for normal operation.
L2 CHECK THE A/C EVAPORATOR TEMPERATURE PID	
• Allow the vehicle exterior and interior to stabilize to an ambient temperature above 16°C (60°F). • Enter the following diagnostic mode on the diagnostic tool: A/C Evaporator Discharge Temperature PCM PID. • **Does the A/C evaporator discharge temperature PID read similar to the ambient temperature?**	**Yes** GO to L3 . **No** INSTALL a new A/C evaporator discharge temperature sensor. TEST the system for normal operation.
L3 VERIFY CUSTOMER COMPLAINT	
• Make sure the engine is at operating temperature.	**Yes** Go To Pinpoint Test J .

• Select panel and A/C modes. • **Is full heat present in all temperature settings?**	**No** GO to L4 .
L4 CARRY OUT THE PCM AND DATC MODULE SELF-TESTS	
• Enter the following diagnostic mode on the diagnostic tool: PCM Self Test. • Key in ON position. • Carry out the PCM self-test. Record any DTCs displayed. • Carry out the DATC module self-test and retrieve continuous DTCs. Refer to Climate Control System . Record the DTCs displayed, if any. • **Were any DTCs displayed?**	**Yes** REFER to the PCM or DATC Module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as necessary. **No** GO to L5 .
L5 CHECK PID WACF WITH THE A/C ON	
NOTE: When PCM PID WACF is YES, this is the same fault as DTC P1460. • Key in ON position. • With the engine running, press the DATC PANEL and A/C override button. Make sure the A/C indicator LED is on. • Enter the following diagnostic mode on the diagnostic tool: PCM PID WACF. • **Does the PCM PID WACF read YES?**	**Yes** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue the diagnosis. **No** GO to L6 .
L6 CHECK PID ACCS WITH THE A/C ON	
• Make sure PID EXT_FT2 reading is greater than 0°C (32°F). • Make sure that the PID ACPEVAP reading is greater than 2°C (35°F). • Make sure the engine is at idle. • Press the DATC PANEL and the A/C override buttons. Make sure the A/C indicator LED is on. • Enter the following diagnostic mode on the diagnostic tool: PCM PID ACCS. • **Does the PCM PID ACCS read ON?**	**Yes** GO to L7 . **No** INSTALL a new DATC module. TEST the system for normal operation.
L7 CHECK PID WAC WITH THE A/C ON	
• Press the DATC PANEL and the A/C override button. Make sure the A/C indicator LED is on. • Enter the following diagnostic mode on the diagnostic tool: PCM PID WAC. • **Does the PID WAC read ON?**	**Yes** GO to L8 . **No** REFER to the Powertrain Control/Emissions Diagnosis (PC/ED) manual to continue the diagnosis.
L8 CHECK THE REFRIGERANT SYSTEM PRESSURE	
• Key in OFF position.	**Yes** GO to L9 .

• Connect the manifold set to the service ports. Refer to Manifold Gauge Set Connection in this section. • **Is the pressure between 345 kPa (50 psi) and 1,724 kPa (250 psi)?**	**No** CHECK the system for refrigerant system leaks. REPAIR as necessary. TEST the system for normal operation.
L9 CHECK FOR POWER TO THE A/C RELAY	
• Key in OFF position. • Disconnect: A/C Clutch Relay. • Key in ON position. • Measure the voltage between A/C clutch relay C1008 pin 3, circuit 30-FA79 (RD/OG), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to L10 . **No** REPAIR circuit 30-FA79 (RD) for an open. TEST the system for normal operation.
L10 CHECK CIRCUIT 15S-FA79 (GN/RD) FOR VOLTAGE	
• Measure the voltage between A/C clutch relay C1008 pin 1, circuit 15S-FA79 (GN/RD), harness side and ground.  • **Is the voltage greater than 10 volts?**	**Yes** GO to L11 . **No** REPAIR circuit 15S-FA79 (GN/RD) for an open. TEST the system for normal operation.
L11 CHECK CIRCUIT 30-FA79 (RD) FOR A SHORT TO GROUND	
• Press the DEFROST override button on the DATC module. • Measure the voltage between A/C clutch relay C1008 pin 1, circuit 15S-FA79 (GN/RD) and pin 2, circuit 91S-FA79 (BN/BU).  • **Is the voltage greater than 10 volts?**	**Yes** GO to L14 . **No** GO to L12 .

L12 CHECK CIRCUIT 91S-FA79 (BN/BU) FOR AN OPEN	
• Key in OFF position. • Disconnect: PCM C175. • Measure the resistance between the A/C control relay socket pin 2, circuit 91S-FA79 (BN/BU) and the PCM C175a-9 circuit 91S-FA79 (BN/BU).  A0034116 • **Is the resistance less than 5 ohms?**	**Yes** GO to L13 . **No** REPAIR circuit 91S-FA79 (BN/BU) for an open. TEST the system for normal operation.
L13 CHECK CIRCUIT 91S-FA79 (BN/BU) FOR A SHORT TO VOLTAGE	
• Key in ON position. • Measure the voltage between the A/C control relay socket pin 2, circuit 91S-FA79 (BN/BU) and the ground.  A0055256 • **Is voltage present?**	**Yes** REPAIR circuit 91S-FA79 (BN/BU). CLEAR the DTCs. TEST the system for normal operation. **No** INSTALL a new PCM. TEST the system for normal operation.
L14 CHECK THE A/C CLUTCH INPUT	
• Key in OFF position. • Connect: A/C Clutch Relay. • Disconnect: A/C Clutch Field Coil C100. • Key in ON position. • With the engine running, measure the voltage between A/C clutch field coil C100-2, circuit 15S-FA6 (GN/YE), harness side and ground.  A0001957 • **Is the voltage greater than 10 volts?**	**Yes** GO to L16 . **No** GO to L15 .
L15 CHECK CIRCUIT 15S-FA6 (GN/YE) FOR AN OPEN	

• Key in OFF position. • Measure the resistance between A/C clutch C100-2, circuit 15S-FA6 (GN/YE) and A/C clutch relay C1008 pin 5, circuit 15S-FA6 (GN/YE).  A0056515 • **Is the resistance 5 ohms or less?**	**Yes** INSTALL a new A/C clutch relay. TEST the system for normal operation. **No** REPAIR circuit 15S-FA6 (GN/YE) for an open. TEST the system for normal operation.
L16 CHECK THE A/C CLUTCH GROUND CIRCUIT FOR AN OPEN	
• Key in OFF position. • Measure the resistance between A/C clutch C100-1, circuit 31-FA6 (BK/YE), harness side and ground.  A0001959 • **Is the resistance 5 ohms or less?**	**Yes** GO to L17 . **No** REPAIR circuit 31-FA6 (BK/YE). TEST the system for normal operation.
L17 CHECK THE CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at three equally spaced locations between the clutch hub and the A/C compressor clutch pulley. • **Is the A/C compressor clutch air gap greater than 0.75 mm (0.030 in)?**	**Yes** ADJUST the A/C compressor clutch field coil. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. TEST the system for normal operation.

Pinpoint Test M: The Air Conditioning (A/C) Is Always On

Normal Operation

Under normal operation, when the Powertrain Control Module (PCM) receives an A/C request signal from the DATC module, the PCM provides a ground for the A/C clutch relay coil through circuit 91S-FA79 (BN/BL). The A/C clutch relay coil receives ignition voltage through circuit 15S-FA79 (GN/RD). The relay switch receives battery voltage through circuit 30-FA79 (RD/OG). When the relay coil is grounded, voltage is delivered through circuit 15-FA6 (GN/YE) to the A/C compressor clutch field coil. Ground for the A/C compressor clutch field coil is provided through circuit 31-FA6 (BK/YE).

Possible Causes

- A short to voltage in circuit 15-FA6 (GN/YE).
- A/C clutch relay.
- A/C compressor clutch/field coil.
- DATC module.
- PCM

PINPOINT TEST M: THE A/C IS ALWAYS ON

Test Step	Result / Action to Take
M1 CARRY OUT THE PCM AND DATC MODULE SELF-TESTS	
• Enter the following diagnostic mode on the diagnostic tool: PCM Self Test. • Key in ON position. • Carry out the PCM self-test. Record any DTCs. • Carry out the DATC module self-test and retrieve continuous DTCs. Refer to Climate Control System under Diagnosis and Testing in this section. Record the DTCs displayed, if any. • **Are any PCM or DATC DTCs displayed?**	**Yes** REFER to the PCM or DATC Module Diagnostic Trouble Code (DTC) Index. CARRY OUT the necessary diagnosis and REPAIR as necessary. **No** GO to M2 .
M2 CHECK DATC BUTTONS	
• With the engine running, toggle between DATC OFF button and the A/C button. • **DOES the A/C indicator light turn on when the A/C button is pushed, and off when the OFF button is pushed?**	**Yes** GO to M3 . **No** INSTALL a new DATC module. TEST the system for normal operation.
M3 CHECK PCM PID ACCS	
• Enter the following diagnostic mode on the diagnostic tool: PCM PID ACCS. • Key in ON position. • Push the DATC OFF button, then push the A/C button. • **Does the A/C indicator light turn off and on and the PCM PID ACCS continue to read ON?**	**Yes** RERUN the Data Link Diagnostic Test. **No** GO to M4 .
M4 CHECK PID WACF WITH THE A/C OFF	
• Key in ON position. • Push the DATC OFF button. • Enter the following diagnostic mode on the diagnostic tool: PCM PID WACF. • **Does PCM PID WACF read YES?**	**Yes** REPAIR circuit 91S-FA79 (BK/OG) for a short to ground. TEST the system for normal operation. **No** GO to M5 .
M5 CHECK FOR POWER ALWAYS ON CIRCUIT 15S-FA6 (GN/YE)	
• Key in OFF position. • Disconnect: A/C Clutch C100. • Key in ON position. • Make sure the DATC is in the OFF position. • Measure the voltage between A/C clutch field coil C100-2, circuit 15S-FA6 (GN/YE), harness side and ground.	**Yes** GO to M7 . **No** GO to M6 .

 A0001957 • **Is the voltage greater than 10 volts?**	
M6 CHECK THE CLUTCH AIR GAP	
• Measure the A/C compressor clutch air gap at three equally spaced locations between the clutch hub and the A/C compressor clutch pulley. • **Is the A/C compressor clutch air gap greater than 0.75 mm (0.030 in)?**	**Yes** ADJUST the A/C compressor clutch field coil. TEST the system for normal operation. **No** INSTALL a new A/C compressor clutch field coil. TEST the system for normal operation.
M7 CHECK CIRCUIT 15-FA6 (GN/YE) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: A/C Clutch Relay. • Key in ON position. • With the engine running, measure the voltage between A/C clutch field coil C100-2, circuit 15S-FA6 (GN/YE), harness side and ground.  A0001957 • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 15S-FA6 (GN/YE) for a short to voltage. TEST the system for normal operation. **No** INSTALL a new A/C clutch relay. TEST the system for normal operation.

Pinpoint Test N: The Blower Motor Is Inoperative

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the DATC module through circuit 31S-FA23 (BK/BU). The coil receives voltage through circuit 30-FA24 (RD/OG). Voltage is supplied to the relay contacts from circuit 30-FA24 (RD/OG). When the relay coil is energized, voltage is delivered to the blower motor through circuit 30S-FA18 (RD/BK). Ground for the motor is provided through circuit 31S-FA18 (BK/RD) from the blower control module. Ground for the blower control module is provided by circuit 31-FA45 (BK). The DATC module sends a 0-volt (LO) to 5-volt (HI) signal to the blower control module through circuit 8-FA45 (WH/BU) to control the blower speed.

Possible Causes

- An open in circuit 31-FA45 (BK), 31S-FA18 (BK/RD), 30S-FA18 (RD/BK), 30-FA24 (RD/OG) or 31S-FA23 (BK/BU).
- A short to ground in circuit 8-FA45 (WH/BU).
- A short to voltage in circuit 31S-FA23 (BK/BU).
- A/C blower relay.
- Blower motor control module.

- DATC module.

PINPOINT TEST N: THE BLOWER MOTOR IS INOPERATIVE

Test Step	Result / Action to Take
N1 VERIFY THE BLOWER MOTOR OPERATION	
• Key in ON position. • Press the PANEL button on the DATC module. Adjust the blower motor setting to LO and then to HI. • **Is the blower motor inoperative in all settings?**	**Yes** GO to N2 . **No** Go To Pinpoint Test O .
N2 CHECK FOR VOLTAGE TO THE BLOWER MOTOR	
• Key in OFF position. • Disconnect: Blower Motor C288. • Key in ON position. • Measure the voltage between blower motor C288, circuit 30S-FA18 (RD/BK) and ground.  AM0416-A • **Is the voltage greater than 10 volts?**	**Yes** GO to N3 . **No** GO to N9 .
N3 CHECK FOR VOLTAGE TO THE BLOWER MOTOR CONTROLLER	
• Key in OFF position. • Disconnect: Blower Motor Speed Control C297. • Key in ON position. • Measure the voltage between blower motor speed control C297-4, circuit 30S-FA45 (RD/OG) and ground.  A0052329 • **Is the voltage greater than 10 volts?**	**Yes** GO to N4 . **No** REPAIR circuit 30S-FA45 (RD/OG) for an open. TEST the system for normal operation.
N4 CHECK CIRCUIT 31-FA45 (BK) FOR AN OPEN	
• Measure the resistance between blower motor speed control C297-2, circuit 31-FA45 (BK) and ground.	**Yes** GO to N5 . **No** REPAIR circuit 31-FA45 (BK) for an open. TEST the system for normal operation.

 A0032581 • **Is the voltage greater than 10 volts?**	normal operation.
N12 CHECK THE DATC MODULE OUTPUT	
• Key in ON position. • Measure the voltage between blower motor relay C1011 socket pin 86, circuit 30-FA24A (RD/OG) and socket pin 85, circuit 31S-FA23 (BK/BU).  A0034149 • **Is the voltage greater than 10 volts?**	**Yes** INSTALL a new blower motor relay. TEST the system for normal operation. **No** GO to N13 .
N13 CHECK CIRCUIT 31S-FA23 (BK/BU) FOR SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: DATC Module C228b. • Key in ON position. • Measure the voltage between blower motor relay C1011 socket pin 85, circuit 31S-FA23 (BK/BU) and ground.  A0013862 • **Is voltage present?**	**Yes** REPAIR circuit 31S-FA23 (BK/BU). TEST the system for normal operation. **No** GO to N14 .
N14 CHECK CIRCUIT 31S-FA23 (BK/BU) FOR AN OPEN	
• Measure the resistance between DATC module C228b-19, circuit 31S-FA23 (BK/BU) and blower motor relay C1011 socket pin 85, circuit 31S-FA23 (BK/BU).  A0034631 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 31S-FA23 (BK/BU) for an open. TEST the system for normal operation.

Pinpoint Test O: The Blower Motor Does Not Operate Correctly

Normal Operation

Under normal operation, the blower motor relay coil receives a ground from the DATC module through circuit 31S-FA23 (BK/BU). The coil receives voltage through circuit 30-FA24 (RD/OG). Voltage is supplied to the relay contacts from circuit 30-FA24 (RD/OG). When the relay coil is energized, voltage is delivered to the blower motor through circuit 30S-FA18 (RD/BK). Ground for the motor is provided through circuit 31S-FA18 (BK/RD) from the blower control module. Ground for the blower control module is provided by circuit 31-FA45 (BK). The DATC module sends a 0-volt (LO) to 5-volt (HI) signal to the blower control module through circuit 8-FA45 (WH/BU) to control the blower speed.

Possible Causes

- An open in circuit 8-FA45 (WH/BU).
- A short to ground in circuit 31S-FA18 (BK/RD) or 31S-FA23 (BK/BU).
- A short to voltage in circuit 8-FA45 (WH/BU) or 30S-FA18 (RD/BK).
- Blower motor control module.
- DATC module.

PINPOINT TEST O: THE BLOWER MOTOR DOES NOT OPERATE CORRECTLY

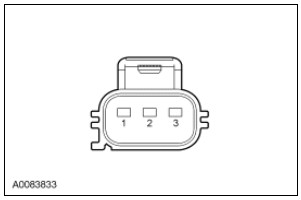
Test Step	Result / Action to Take
O1 VERIFY THE BLOWER MOTOR OPERATION	
• Key in ON position. • Press the PANEL button on the DATC module. Adjust the blower motor setting to LO and then to HI. • **Does the blower motor operate at any setting?**	**Yes** If the blower motor operates always in HIGH, GO to O2 . If the blower motor is always ON, GO to O5 . **No** Go To Pinpoint Test N .
O2 CHECK CIRCUIT 31S-FA18 (BK/RD) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: Blower Motor Speed Control C297. • Key in ON position. • **Does the blower motor operate?**	**Yes** REPAIR circuit 31S-FA18 (BK/RD) for a short to ground. TEST the system for normal operation. **No** GO to O3 .
O3 CHECK CIRCUIT 8-FA45 (WH/BU) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: DATC Module C228a. • Key in ON position. • Measure the voltage between blower motor speed control C197-3, circuit 8-FA45 (WH/BU) and ground.	**Yes** REPAIR circuit 8-FA45 (WH/BU) for a short to voltage. TEST the system for normal operation. **No** GO to O4 .

 A0056184 • **Is voltage present?**	
O4 CHECK CIRCUIT 8-FA45 (WH/BU) FOR AN OPEN	
• Key in OFF position. • Measure the resistance between blower motor speed control C197-3, circuit 8-FA45 (WH/BU) and DATC Module C228a-15, circuit 8-FA45 (WH/BU).  N0006517 • **Is the resistance less than 5 ohms?**	**Yes** INSTALL a new blower motor speed control. TEST the system for normal operation. **No** REPAIR circuit 8-FA45 (WH/BU) for an open. TEST the system for normal operation.
O5 CHECK THE DATC MODULE OUTPUT	
• Key in OFF position. • Disconnect: Blower Motor Relay C1011. • Key in ON position. • Measure the voltage between blower motor relay C1011 socket pin 86, circuit 30-FA24A (RD/OG) and socket pin 85, circuit 31S-FA23 (BK/BU).  A0034149 • **Is the voltage greater than 10 volts?**	**Yes** GO to O6 . **No** GO to O7 .
O6 CHECK CIRCUIT 31S-FA23 (BK/BU) FOR A SHORT TO GROUND	
• Key in OFF position. • Disconnect: DATC Module C228a. • Measure the resistance between blower motor relay C1011 socket pin 85, circuit 31S-FA23 (BK/BU) and ground.  A0013869 • **Is the resistance greater than 10,000 ohms?**	**Yes** INSTALL a new DATC module. TEST the system for normal operation. **No** REPAIR circuit 31S-FA23 (BK/BU) for a short to ground. TEST the system for normal operation.

O7 CHECK CIRCUIT 30S-FA18 (RD/BK) FOR A SHORT TO VOLTAGE	
• Key in OFF position. • Disconnect: Blower Motor C288. • Key in ON position. • Measure the voltage between blower motor C288, circuit 30S-FA18 (RD/BK) and ground.  AM0416-A • **Is the voltage greater than 10 volts?**	**Yes** REPAIR circuit 30S-FA18 (RD/BK) for a short to voltage. TEST the system for normal operation. **No** GO to O8 .
O8 CHECK THE DATC MODULE BLOWER CONTROL OUTPUT	
• Adjust the blower motor speed to LO (1 bar). • Measure the voltage between DATC module C228a-15, circuit 8-FA45 (WH/BU) and ground by back-probing DATC module C228a.  A0028942 • **Is the voltage less than 1 volt?**	**Yes** INSTALL a new blower motor speed control. TEST the system for normal operation. **No** INSTALL a new DATC module. TEST the system for normal operation.

Component Tests

Coolant Control Valve



A0083833

Coolant Control Valve Pins	Resistance
1 and 2	10-23 ohms
2 and 3	10-23 ohms

Heater Core

⚠ WARNING: Carbon monoxide is colorless, odorless and dangerous. If it is necessary to operate the engine with the vehicle in a closed area such as a garage, always use an exhaust collector to vent the exhaust gases outside the closed area.

1. **NOTE:** Testing of returned heater cores reveals that a large percentage of heater cores are good and did not require the installation of a new heater core. If a heater core leak is suspected, the heater core must be tested by following the plugged heater core component test before the heater core pressure test. Carry out a system inspection by checking the heater system thoroughly as follows:

   Inspect for evidence of coolant leakage at the heater hose to heater core attachments. A coolant leak in the heater hose could follow the heater core tube to the heater core and appear as a leak in the heater core.

2. **NOTE:** Spring-type clamps are installed as original equipment. Installation and overtightening of non-specified clamps can cause leakage at the heater hose connection and damage the heater core.

   Check the integrity of the heater hose clamps.

Heater Core Plugged

⚠ WARNING: The heater core inlet hose will become too hot to handle if the system is working correctly.

1. Check to see that the engine coolant is at the correct level.

2. Start the engine and turn on the heater.

3. When the engine coolant reaches operating temperature, feel the heater core inlet and outlet hoses to see if they are hot.

4. If the outlet only is not hot:
   - the heater core may have an air pocket.
   - the heater core may be plugged.

5. If the inlet only is not hot:
   - the thermostat may not be working correctly.
   - the coolant control valve may not be working correctly.

Heater Core Pressure Test

Use the Pressure Test Kit to carry out the pressure test.

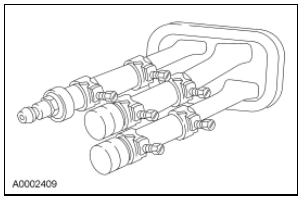
1. **NOTE:** Due to space limitations, a bench test may be necessary for pressure testing.

   Drain the coolant from the cooling system.

2. Disconnect the heater hoses from the heater core.

3. Install a short piece of heater hose, approximately 101 mm (4 inches) long on each heater core tube.

4. Fill the heater core and heater hoses with water and install the 2 plugs BT-7422-B and the adapter BT-7422-A from the Pressure Test Kit. Secure the heater hoses, plug and adapter with hose clamps.



5. Attach the pump and gauge assembly from the Pressure Test Kit to the adapter.

6. Close the bleed valve at the base of the gauge. Pump 138 kPa (20 psi) of air pressure into the heater core.

7. Observe the pressure gauge for a minimum of 3 minutes.

8. If the pressure drops, check the heater hose connections to the core tubes for leaks. If the heater hoses do not leak, remove the heater core from the vehicle and carry out the bench test.

Heater Core Bench Test

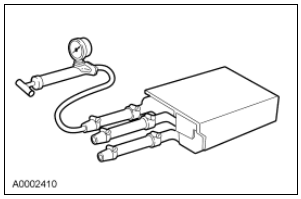
1. Remove the heater core from the vehicle.

2. Drain all of the coolant from the heater core.

3. Connect the 101 mm (4 inch) test heater hoses with plug and adapter to the core tubes. Then connect the Pressure Test Kit to the adapter.

4. Apply 138 kPa (20 psi) of air pressure to the heater core. Submerge the heater core in water.

5. If a leak is observed, install a new heater core.



Evaporator/Condenser Core On-Vehicle Leak Test

1. Discharge and recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the suspect evaporator core or condenser core from the A/C system.

3. Clean the manifold fittings.

4. Connect the appropriate test fittings from the Set, A/C Fittings to the condenser core tube connections.

5. Connect the Vacuum Check Fitting, TXV to the thermostatic expansion valve.

6. **NOTE:** The automatic shut-off valves on some gauge set hoses do not open when connected to the test fittings. If available, use hoses without shut-off valves. If hoses with shut-off valves are used, make sure the valve opens when attached to the test fittings or install an adapter that will activate the

valve. The test is not valid if the shut-off valve does not open.

Connect the red and blue hoses from the R-134a Manifold Gauge Set to the test fittings on the evaporator core or condenser core. Connect the yellow hose to a known good vacuum pump.

7. Open both gauge set valves and start the vacuum pump. Allow the vacuum pump to operate for a minimum of 45 minutes after the gauge set low pressure gauge indicates 101 kPa (30 in-Hg). The 45-minute evacuation is necessary to remove any refrigerant from oil left in the evaporator core or condenser core. If the refrigerant is not completely removed from the oil, outgassing will degrade the vacuum and appear as a refrigerant leak.

8. If the low pressure gauge reading will not drop to 101 kPa (30 in-Hg) when the valves on the gauge and manifold set are open and the vacuum pump is operating, close the gauge set valves and observe the low pressure gauge. If the pressure rises rapidly to zero, a large leak is indicated. Recheck the test fitting connections and gauge set connections before installing a new evaporator core or condenser core.

9. After evacuating for 45 minutes, close the gauge set valves and stop the vacuum pump. Observe the low pressure gauge; it should remain at the 101 kPa (30 in-Hg) mark.
    - If the low pressure gauge reading rises 34 or more kPa (10 or more in-Hg) of vacuum from the 101 kPa (30 in-Hg) position in 10 minutes, a leak is indicated.
    - If a very small leak is suspected, wait 30 minutes and observe the vacuum gauge.
    - If a small amount of vacuum is lost, operate the vacuum pump with gauge valves open for an additional 30 minutes to remove any remaining refrigerant from the oil in the evaporator core or condenser core. Then recheck for loss of vacuum.
    - If a very small leak is suspected, allow the system to sit overnight with vacuum applied and check for vacuum loss.

10. If the evaporator core or condenser core does leak, as verified by the above procedure, install a new evaporator core or condenser core.

A/C Compressor External Leak Test

1. Install the A/C Pressure Test Adapter on the port of the A/C compressor, using the existing manifold retaining bolt.

2. Connect the high and low pressure lines of a manifold gauge set or a refrigerant recovery/recycling station such as the R-134a A/C service center to the corresponding fittings on the A/C Pressure Test Adapter.

3. Attach the center hose of a manifold gauge set to a refrigerant container standing in an upright position.

4. Hand-rotate the compressor shaft 10 complete revolutions to distribute the oil inside the A/C compressor.

5. Open the low pressure gauge valve, the high pressure gauge valve and the valve on the refrigerant container to allow the refrigerant vapor to flow into the A/C compressor.

6. Using the Refrigerant Leak Detector, check for leaks at the compressor shaft.

7. If a shaft or external leak is found, install a new A/C compressor.

8. When the leak test is complete, recover the refrigerant from the compressor.

Air Conditioning (A/C) System Check Retail Procedure

Printable View (13 KB)

NOTE: This Retail Procedure is not eligible for claims on Ford paid repairs (warranty and ESP).

NOTE: The engine should be run at idle for 10 minutes with the air conditioning on and set to MAX A/C (if equipped) or FULL COOL and RECIRC (if equipped) before carrying out this retail procedure.

NOTE: Read and follow all of the Warnings, Cautions and Notes at the beginning of this section before continuing.

Visual inspection

1. Open the hood and visually inspect the heating and air conditioning systems for the following:
   - Coolant reservoir for correct coolant level
   - Heater hoses for deterioration or loose connections
   - Radiator and condenser for foreign material or damaged fins restricting airflow, loose mounting or connections
   - Accessory drive belt(s) and cooling fan(s) for wear or physical damage
   - Refrigerant lines and connections for physical damage or loose connections
   - Compressor for physical damage or loose connections
   - Suction accumulator (if equipped) or receiver/drier (if equipped) for physical damage or loose connections
   - Wiring and connectors for excessive wear, loose or damaged connections, or incorrect routing

A/C refrigerant analysis

2. Carry out air conditioning refrigerant analysis. For additional information, refer to Refrigerant Identification Testing in this section.
   - If the refrigerant fails the analysis, discontinue diagnosis and make recommendations for repairs.
   - If the refrigerant passes the analysis, carry out the air conditioning system check.

Air conditioning system check

3. Check the air conditioning system.
   - Connect an R-134a manifold gauge set or refrigerant service center with gauges to the refrigerant system.
   - With the vehicle in PARK, parking brake set, thermometer installed in center panel vent, and air conditioning system on and set to MAX A/C (if equipped) or FULL COOL and RECIRC (if equipped), start the engine.
   - Record the air refrigerant system pressures while running the engine at 1,500 rpm and allow the engine to return to idle.
   - Operate the blower motor in all control positions and check for correct blower speed changes.
   - With the blower motor on MED HI, operate the air discharge mode selector in all positions and check for correct airflow in each position.
   - Operate the temperature blend selector in all positions and check for correct change in discharge temperature. Check the air discharge temperature with the selector in the coolest position and the air conditioning on and set to MAX A/C (if equipped) or FULL COOL and RECIRC (if equipped) to determine if the air discharge temperature is acceptable for the current ambient air temperature.

- Carry out the ATC self-test (if applicable).
  If the refrigerant system pressures were low, carry out the refrigerant system leak test.

Refrigerant system leak test

4. Use either an ultraviolet (UV) or an electronic leak detector to check for leaks at all refrigerant lines, connections, and components.
   - After all tests have been completed, report all findings and recommended repairs to your service advisor before carrying out further diagnostic procedures.

Spring Lock Coupling

Printable View (116 KB)

Special Tool(s)

 ST2352-A	Remover, Refrigerant Coupling Spring 412-039 (T84L-19623-B)

Material

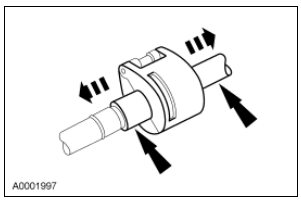
Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Disconnect

1. Remove the spring lock coupling clip, if equipped.
2. **CAUTION: Do not use metal tools to remove the O-ring seals. They can cause axial scratches across the O-ring seal grooves, resulting in refrigerant leaks.**

   Push the tool into the cage opening to release the female fitting from the spring lock coupling spring and pull the fitting apart.

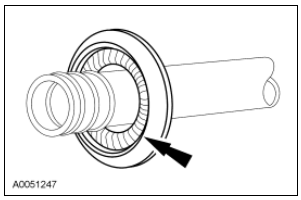
   - Remove the O-ring seals using a non-metallic tool.



A0001997

3. **CAUTION: Do not use a screwdriver or similar tool to remove the A/C tube lock coupling spring; this can cause axial scratches across the O-ring seal grooves resulting in refrigerant leaks.**

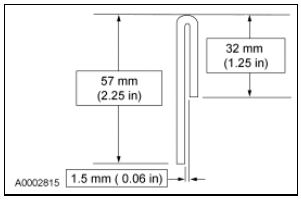
   Remove the spring lock coupling spring with a small hooked wire.



A0051247

Cleaning

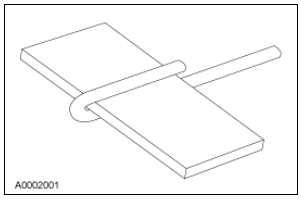
1. Fabricate a cleaning tool from a 1/8 inch diameter brazing rod.



2. Cut an abrasive pad from maroon colored 3M Scotch Brite® with the dimensions corresponding to the coupling size.

Coupling Size	Pad Size
3/8 inch	25 x 50 mm (1 x 2 inch)
1/2 inch	25 x 50 mm (1 x 2 inch)
5/8 inch	25 x 76 mm (1 x 3 inch)
3/4 inch	25 x 102 mm (1 x 4 inch)

3. Assemble the pad to the tool.

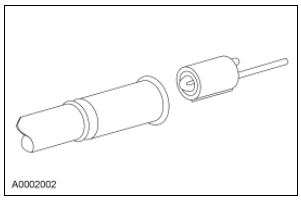


4. Coat the abrasive pad with mineral oil.

5. Roll the pad on the tool and install it in a variable speed drill motor.

6. ⚠ **CAUTION: Maintain low speed drill rotation when inserting or removing the cleaning tool to prevent axial scratches which may cause future leaks.**

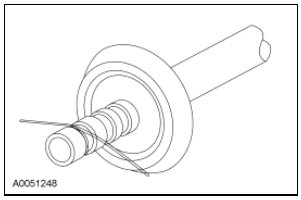
   Polish for one minute at moderate speed (less than 1,500 rpm) or until the surface is clean and free of scratches or foreign material.



7. Clean the fitting with a lint-free cloth.

8. Inspect the surface for grooves or scratches. If grooves and scratches are still present, install a new component.

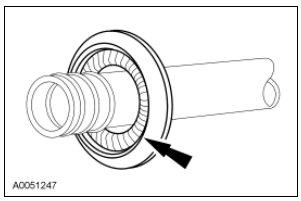
9. Clean the O-ring seal grooves with a 300 mm (12 inch) length of natural fiber string.
   - Loop the string around the grooves and pull the string back and forth.



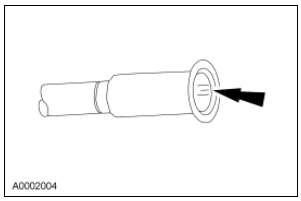
10. Remove any foreign material from the grooves with a lint-free cloth.

Connect

1. Install the spring lock coupling spring.

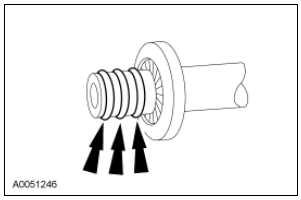


2. Lubricate the inside of the coupling with PAG oil.

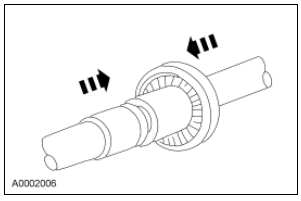


3. ⚠ **CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may result in intermittent leakage during vehicle operation.**

   Install the O-ring seals.



4. Connect the spring lock coupling fittings with a twisting motion until the spring lock coupling spring snaps over the flared end of the female fitting.



5. Install the spring lock coupling clip.

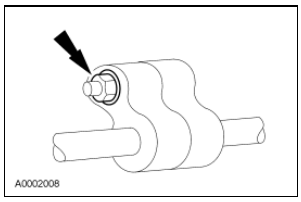
Air Conditioning Line (Peanut) Fitting

Printable View (30 KB)

Disconnect

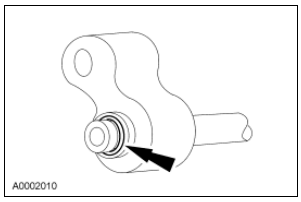
1. **CAUTION: Support the female fitting with a wrench to prevent the tubes from twisting.**

   Remove the nut and separate the 2 halves of the peanut fitting.



2. **CAUTION: Do not use metal tools to remove the O-ring seal. They can cause axial scratches across the O-ring seal groove, resulting in refrigerant leaks.**

   Remove the O-ring seal with a non-metallic tool.

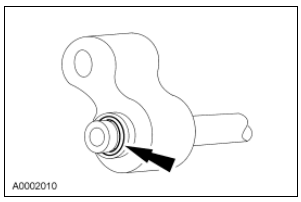


Connect

1. Clean all dirt or foreign material from the fittings.

2. **CAUTION: Use only the new O-ring seals. The use of any O-ring seals other than those specified in the Ford Master Parts Catalog may result in intermittent leakage during vehicle operation.**

   Install the O-ring seal.



3. **NOTE:** When correctly assembled, the male and female fittings should be flush.

   Assemble the male and female fittings together.

Refrigerant System Tests

Printable View (220 KB)

Special Tool(s)

ST2738-A	R-134a Refrigerant Center 176-00002 or equivalent
ST2739A	R-134a Refrigerant Center 023-00174 or equivalent
ST1928-A	R-134a Manifold Gauge Set 023-00047 or equivalent

Procedure 1 Ambient Temperature At or Below 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow procedure 1. If the ambient temperature is over 38°C (100°F), follow procedure 2.

NOTE: If the A/C compressor cycles at any time during this test, refer to the diagnostic table.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a manifold gauge set or refrigerant service center with high-pressure and low-pressure gauges to the refrigerant system.

3. Set the climate controls.
   - If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, HI Blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If equipped with ATC, set temperature to 60° F (15° C) (lowest possible temp setting) with the dual function disabled (if equipped). Manually set blower on high. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
   - If the vehicle is equipped with auxiliary climate control, set the auxiliary controls to full COOL in the PANEL mode at HI blower speed.

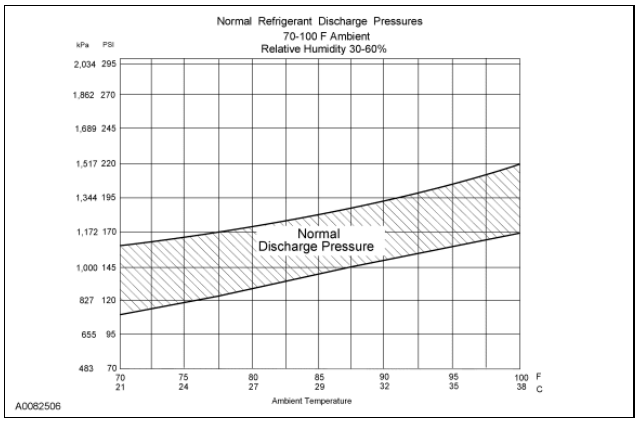
4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.

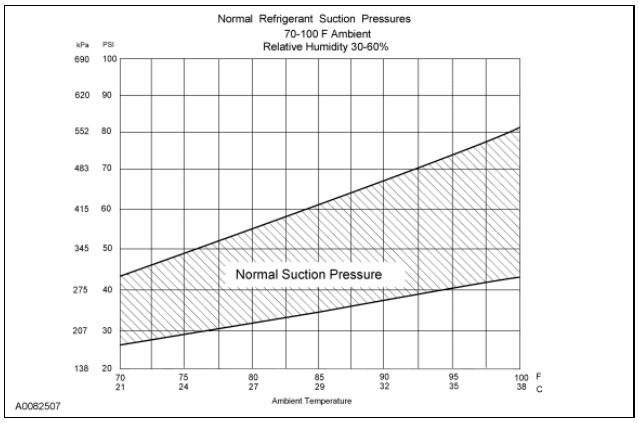
7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.



9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.



11. Proceed to the diagnostic table.

Procedure 2 Ambient Temperature Above 38°C (100°F)

NOTE: The system performance can be evaluated and diagnosed by analysis of the compressor suction and discharge pressures. The following procedure is used to determine if the system is operating at normal pressures.

NOTE: The procedure varies depending on the ambient (shop) temperature. If the ambient temperature is 38°C (100°F) or lower, follow procedure 1. If the ambient temperature is over 38°C (100°F), follow procedure 2.

1. Drive the vehicle or run the engine until it reaches normal operating temperature.

2. Connect a manifold gauge set or refrigerant service center with high-pressure and low-pressure gauges to the refrigerant system.

3. Set the climate controls.

- If equipped with manual climate control, set the A/C controls for normal A/C-PANEL mode, full COOL temperature, FRESH air, MED LO blower. If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
- If equipped with ATC, set temperature to 60° F (15° C) (lowest possible temp setting). Manually set blower to MED LO (3 to 4 bars). If the vehicle has a fresh air/recirc button, set it to FRESH. If the vehicle has an A/C switch or compressor on switch, set it to A/C ON.
- If the vehicle is equipped with auxiliary climate control, set the auxiliary controls to full COOL in the PANEL mode at MED LO blower speed.

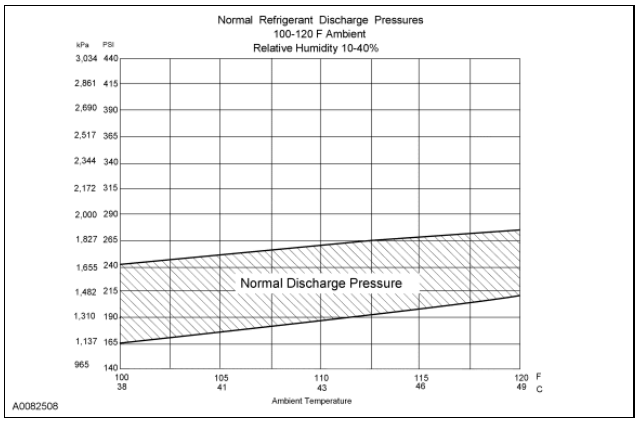
4. Open all vehicle windows and leave the hood open for the test. Open the rear hatch and/or rear doors (if equipped).

5. Confirm the compressor clutch is engaged and the engine cooling fan(s) are operating or engaged. Allow the vehicle to idle until the suction (low-side) and discharge (high-side) pressures are stable or fluctuate in a range that repeats.

6. Record the ambient (shop) temperature.

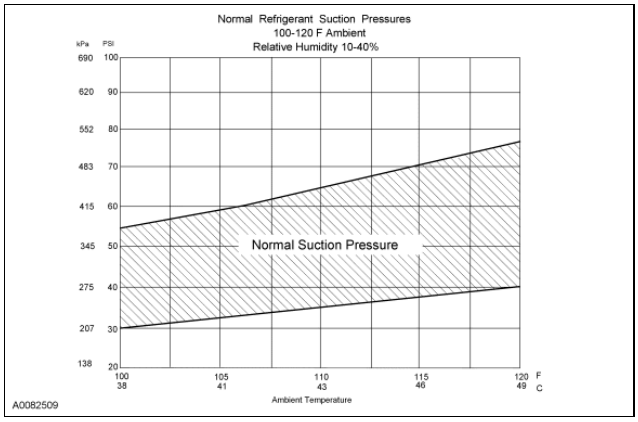
7. Record the discharge pressure. If the pressure is fluctuating, record the average value.

8. Determine if the discharge pressure falls within the normal operating limits using the Normal Refrigerant Discharge Pressures chart.



9. Record the suction pressure. If the pressure is fluctuating, record the average value.

10. Determine if the suction pressure falls between normal operating limits using the Normal Refrigerant Suction Pressures chart.



11. Proceed to the diagnostic table.

Diagnostic Table

1. **NOTE:** The following table is used to guide diagnosis of the refrigerant system if operating pressures are outside normal limits.

   Refer to the chart below.

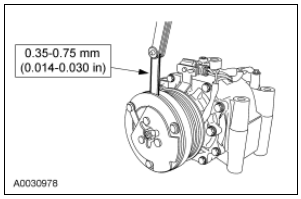
High (Discharge) Pressure	Low (Suction) Pressure	Component Causes
High or clutch cycling	High	Condenser inadequate airflow.
High	Normal to high	Engine overheating.
Normal to high	Normal	Refrigerant overcharge air in refrigerant.
Normal to low	High	Thermostatic expansion valve
Normal to low	Normal to high	A/C suction line partially restricted or plugged [a] .
Normal to low	Low or clutch cycling	Low refrigerant charge, A/C suction line partially restricted or plugged.
Erratic operation or compressor not running		Evaporator discharge temperature sensor poor connection at A/C clutch connector. A/C electrical circuit erratic see A/C Electrical Circuit Wiring Diagram.
Normal to low	High	Compressor low performance.
Additional Possible Cause Components Associated With Inadequate Compressor Operation		
• Compressor drive belt loose • Compressor clutch slipping • Clutch coil open shorted, or loose mounting • Control assembly • Clutch wiring circuit high resistance, open or blown fuse • Compressor operation interrupted by PCM		
Additional Possible Cause Components Associated With a Damaged Compressor		
• Incorrect clutch air-gap • Receiver/drier plugged • Refrigerant leaks		

[a] Low pressure reading will be normal to high if pressure is taken at accumulator and if restriction is downstream of service access valve.

A/C Clutch Air Gap Adjustment

Printable View (31 KB)

1. Check the A/C clutch air gap at three equally spaced places between the clutch hub and the A/C clutch pulley.



2. Remove the A/C clutch. Add or remove spacers between the A/C clutch and the compressor shaft until clearance is within specifications.

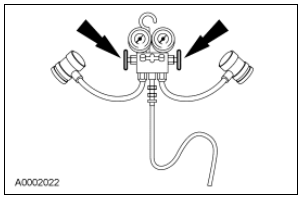
Manifold Gauge Set Connection

Printable View (92 KB)

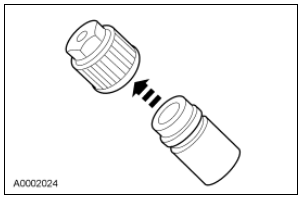
Special Tool(s)

 ST1928-A	R-134a Manifold Gauge Set 176-R032A or equivalent

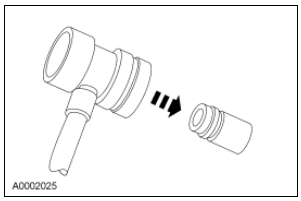
1. Turn both valves on the R-134a Manifold Gauge Set clockwise to close the low- and high-pressure hoses to the center manifold and center hose.



2. Remove the A/C charging valve cap from the high-pressure service gauge port valve.

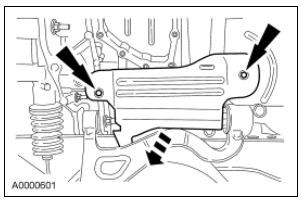


3. Connect the R-134a Manifold Gauge Set high-pressure hose and the R-134a high side quick disconnect to the high-pressure service gauge port valve.

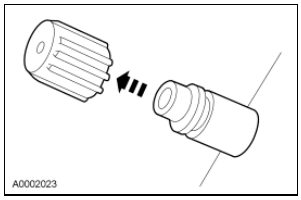


4. Raise the vehicle. For additional information, refer to Section 100-02 .

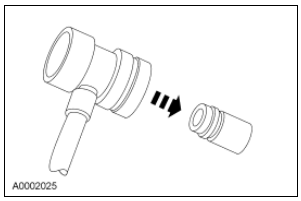
5. Remove the screws and the left sight shield.



6. Remove the A/C charging valve cap (19D702) from the low-pressure service gauge port valve.



7. Connect the R-134a Manifold Gauge Set low-pressure hose and the R-134a low side quick disconnect to the low-pressure service gauge port valve.



8. To disconnect the manifold and gauge set, reverse the connection procedure.

Electronic Leak Detection

Printable View (49 KB)

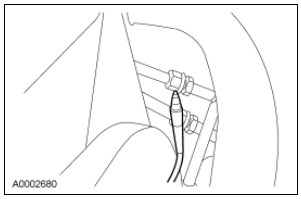
Special Tool(s)

 ST2351-A	H10PM Refrigerant Leak Detector With Battery 216-00001 or equivalent

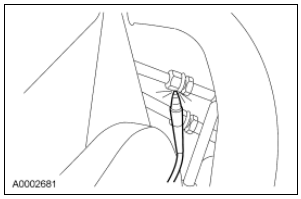
⚠ CAUTION: Good ventilation is necessary in the area where electronic A/C leak testing is to be carried out. If the surrounding air is contaminated with refrigerant gas, the leak detector will indicate this gas all the time. Odors from other chemicals such as antifreeze, diesel fuel, disc brake cleaner or other cleaning solvents can cause the same problem. Using a fan to ventilate the area to be tested before proceeding with the leak detection procedure is helpful in removing small traces of contamination from the air, but the fan should be turned off during actual testing.

1. **NOTE:** The system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

   Leak test the refrigerant system using the Refrigerant Leak Detector. Follow the instructions included with the leak detector for handling and operation techniques.



2. If a leak is found, recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.
   - Repair the system.
   - Test the system for normal operation.



Fluorescent Dye Leak Detection

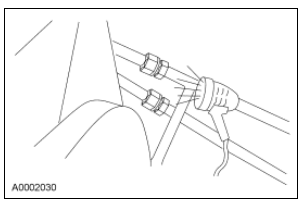
ST2651-A	High Intensity UV Lamp 12 Volt 164-R6000 or equivalent
 ST1705-B	R-134a Fluorescent Dye Injector 164-R0775 or equivalent
ST2649-A	Deluxe Injector Loop Kit 219-00069 or equivalent
ST2650-A	R-134a Leak Detection Dye 164-R6060

Fluorescent Dye Detection

NOTE: Ford Motor Company vehicles are produced with R-134a fluorescent dye installed in the refrigerant system from the factory. The location of leaks can be pinpointed by the bright yellow-green glow of the fluorescent dye under a UV lamp. Since more than one leak can exist, make sure to inspect each component, line and fitting in the refrigerant system for a leak.

1. Check for leaks using a Rotunda-approved UV lamp.
   - Inspect all components, lines and fittings of the refrigerant system.



A0002030

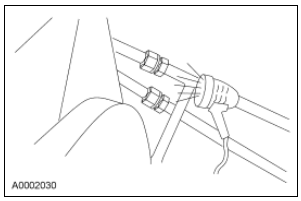
2. If a leak is found, recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

3. Repair the refrigerant system leak(s).

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. After the leak(s) is/are repaired, remove any traces of fluorescent dye with a general purpose oil solvent.

6. Verify the repair by running the vehicle for a short period of time and rechecking the area of the leak with a Rotunda-approved UV lamp.



Fluorescent Dye Injection Using an A/C Refrigerant Center and Dye Injector

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50 percent of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

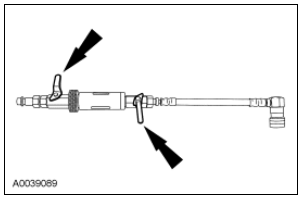
NOTE: Before using the R-134a fluorescent dye injector for the first time, refer to the manufacturers instructions on evacuation of any non-condensable gasses from the hoses.

NOTE: Only connect the R-134a fluorescent dye injector to a manifold and gauge set or R-134a service center when fluorescent dye is to be injected. The R-134a fluorescent dye injector has a one way check valve that will prevent refrigerant system recovery and evacuation.

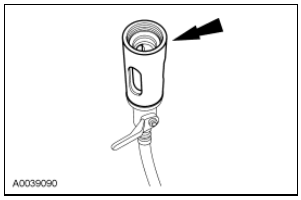
NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C (75°F) with the engine off.

1. Connect an R-134a A/C refrigerant service center or a manifold and gauge set to the refrigerant system service port valves.

2. Verify that the valves on the fluorescent dye injector are closed.



3. Fill the fluorescent dye injector reservoir with 7 ml (0.25 oz) of fluorescent dye.



4. Install the fluorescent dye injector between the low-pressure service gauge port valve and the R-134a refrigerant service center or manifold gauge set.

5. Open all valves and inject the fluorescent dye into the refrigerant system.

6. When fluorescent dye injection is complete, close all valves.

7. Recover the refrigerant from the R-134a fluorescent dye injector.

8. Remove the fluorescent dye injector from the low-pressure service gauge port valve and the R-134a A/C refrigerant service center or manifold gauge set.

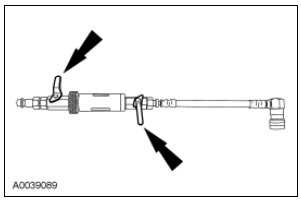
Fluorescent Dye Injection Using a Dye Injector Loop Kit

NOTE: Fluorescent refrigerant system dye is added to the refrigerant system at the factory to assist in refrigerant system leak diagnosis using a Rotunda-approved ultraviolet blacklight. It is not necessary to add additional dye to the refrigerant system before diagnosing leaks, even if a significant amount of refrigerant has been removed from the system. Replacement suction accumulators and receiver/driers are shipped with a fluorescent dye "wafer" included in the desiccant bag which will dissolve after approximately 30 minutes of continued A/C operation. It is not necessary to add dye after flushing or filtering the refrigerant system because a new suction accumulator or receiver/drier is installed as part of the flushing or filtering procedure. Additional refrigerant system dye should only be added if more than 50 percent of the refrigerant system lubricant capacity has been lost due to a fitting separation, hose rupture or other damage.

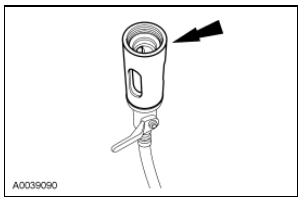
NOTE: Before using the R-134a fluorescent dye injector for the first time, refer to the equipment manufacturers instructions on evacuation of non-condensable gasses from the hoses.

NOTE: Refrigerant system pressure should be between 413-551 kPa (60-80 psi) at 24°C.

1. Verify that the valves on the deluxe injector loop kit are closed.



2. Fill the deluxe injector loop kit reservoir with 7 ml (0.25 oz) of fluorescent dye.

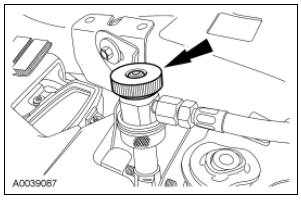


3. Install the deluxe injector loop kit between the high-pressure and low-pressure service gauge port valves.

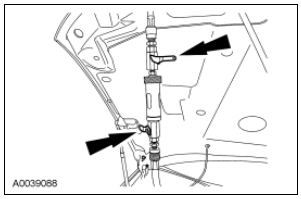
4. ⚠ **CAUTION: Make sure all tools and hoses are clear of the engine cooling fan and drive belt before starting the engine.**

   Start the engine.

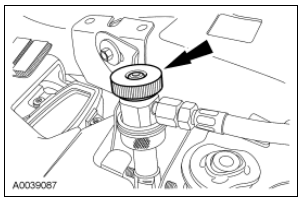
5. Open the high-pressure service valve.



6. Open the deluxe injector loop kit valves and inject the fluorescent dye into the refrigerant system.

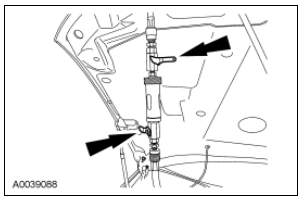


7. Close the high-pressure service valve to allow the pressure inside the deluxe injector loop kit to equalize with the suction side of the refrigerant system.



8. **NOTE:** Close the valves on the deluxe injector loop kit while the A/C compressor is operating.

   Close the valves on the deluxe injector loop kit.



9. **NOTE:** Leave all valves on the special tool closed when not in use.

   Disconnect the high-pressure and low-pressure service valves and remove the deluxe injector loop kit from the vehicle.

Air Conditioning (A/C) System Recovery, Evacuation and Charging

Refrigerant System Recovery

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Prior to recovering, you must verify the purity of the refrigerant. For additional information, refer to Refrigerant Identification Testing in this section.

2. Connect an R-134a refrigerant service center to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Recover the refrigerant from the system following the operating instructions provided by the equipment manufacturer.

4. Once the refrigerant service center has recovered the refrigerant, switch OFF the power supply.

5. Allow the system to set for about 2 minutes, and observe the system vacuum reading. If the vacuum is not lost, disconnect the recovery equipment.

6. If the system does lose vacuum, repeat Steps 3 through 5 until the vacuum level remains stable for 2 minutes.

7. Carry out the required repairs.

Refrigerant System Evacuation Using an R-134a Service Center

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect an R-134a service center to the low- and high-pressure service gauge port valves following the operating instructions provided by the equipment manufacturer.

2. Evacuate the system until the low-pressure gauge reads at least 99.4 kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the vacuum pump for a minimum of 45 minutes.

3. Turn off the vacuum pump. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Evacuation Using an R-134a Manifold Gauge Set

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak in vacuum that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Connect the R-134a manifold gauge set to the low-side and high-side service gauge port valves.

2. Connect the center (yellow) hose from the manifold gauge set to the suction port on the vacuum pump.

3. Open all valves on the R-134a manifold gauge set and both service gauge port valves.

4. Turn on the vacuum pump and evacuate the system until the low-pressure gauge reads at least 99.4

kPa (29.5 in-Hg) of vacuum and as close to 101.1 kPa (30 in-Hg) as possible. Continue to operate the vacuum pump for a minimum of 45 minutes.

5. Close the high-side and low-side valves on the manifold gauge set (not the service gauge port valves) and turn off the vacuum pump.

6. Observe the low-pressure gauge for 5 minutes to make sure that the system vacuum is held. If vacuum is not held for 5 minutes, leak test the system, repair the leak and evacuate the system again.

Refrigerant System Charging Using an R-134a Service Center

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

2. Connect an R-134a A/C service center to the low-side and high-side service gauge port valves following the operating instructions provided by the equipment manufacturer.

3. Set the refrigerant charge amount, and charge the refrigerant system following the instructions provided by the equipment manufacturer.

Refrigerant System Charging

NOTE: Ford Motor Company recommends use of an A/C service center to carry out recovery, evacuation and charging of the refrigerant system. If an A/C service center is not available, refrigerant system recovery, evacuation and charging may be accomplished using a separate recovery station, vacuum pump, charging meter and manifold gauge set.

NOTE: Leaks in refrigerant system service equipment, hoses or gauges can cause a leak that may be misinterpreted as a problem with the vehicle's refrigerant system. It is necessary to leak-test all refrigerant system service equipment, hoses and gauges on a weekly basis to verify that no leaks are present.

1. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

2. Assemble the R-134a manifold gauge set, automatic refrigerant charging meter and R-134a supply tank following the automatic refrigerant charging meter operating instructions.

3. Charge the refrigerant system following the automatic refrigerant charging meter operating instructions.

4. If the refrigerant flow stops before the refrigerant charge is complete, start the engine, select A/C operation and allow the refrigerant charge to complete.

Air Conditioning (A/C) System Flushing

Printable View (25 KB)

Special Tool(s)

ST2466-A	A/C Flush and Purge Machine 219-00022 (part of 219-00023) or equivalent
 ST2469-A	A/C Flush and Purge Fitting Kit 219-00024 (part of 219-00023) or equivalent

Material

Item	Specification
A/C System Flushing Solvent YN-23	
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

⚠ WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

⚠ WARNING: Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on or flushing A/C systems.

⚠ CAUTION: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer procedures and instructions.

⚠ CAUTION: Suction accumulator or receiver/drier, thermal expansion valve (TXV) and/or evaporator core orifice, and hoses with mufflers, should be removed when flushing the A/C system. Internal plumbing of these devices makes it impossible to correctly remove any residual-flushing agent. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The 3.785 liters (1 gallon) of A/C System Flushing Solvent YN-23 and FL1-A filter used in A/C Flush and Purge Machine 219-00022 are intended for use on one vehicle only. They may be used to flush both the A/C condenser core and the A/C evaporator core on an individual vehicle, but under no circumstances should they be used on more than one vehicle.

NOTE: Prior to using the A/C Flush and Purge Machine 219-00022 for the first time, review the operating instructions.

NOTE: Only the A/C Flush and Purge Machine kit 219-00023, which includes A/C Flush and Purge Machine 219-00022, A/C Flush and Purge Fitting Kit 219-00024 and A/C Systems Flushing Solvent, is approved for

use on Ford vehicles. No other flushing device or solvent is approved for flushing heat exchangers (A/C condenser, A/C evaporator). Use of any other flusher or solvent may cause damage to the A/C system and the flushing unit.

NOTE: Ford Motor Company has approved a procedure to provide technicians with a non-CFC method of flushing contaminated A/C system heat exchangers. The procedure allows the specific components to be cleaned and flushed while installed in their normal in-vehicle location. The types of contamination flushed include particle matter that results from A/C compressor or desiccant failure and gummy residue that can form when refrigerant oil is overheated during A/C compressor seizure. The flushing process is a 2-step procedure that involves the use of an A/C Flush and Purge Machine 219-00022 to:

- circulate the flushing solvent through the heat exchanger in the reverse direction of normal refrigerant flow (back-flushing). Particulate matter picked up during flushing is filtered from the returning solvent before the solvent is returned to the reservoir for continued circulation.
- remove the flushing solvent from the heat exchanger. In this step of the procedure, pressurized air 621-862 kPa (90-125 psi) is used to push and evaporate any remaining flush solvent from the heat exchanger.

1. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

2. Disconnect the refrigerant lines from the heat exchanger(s) to be flushed.

3. Connect the A/C flush and purge machine fitting kit and the A/C flush and purge machine to the heat exchanger to be flushed. Do not flush through the evaporator core orifice (if equipped), TXV (if equipped), or hoses with mufflers. Internal plumbing and material make-up of these components make it impossible to correctly remove foreign material or residual flushing solvent.

4. **NOTE:** Use 3.785 liters (one gallon) of A/C Systems Flushing Solvent to flush the heat exchanger for a minimum of 15 minutes. The flush solvent may be used for one or both heat exchangers in the A/C system. However, the flush solvent is intended for one vehicle only. The filter used on the flushing unit is also intended for use on one vehicle only.

   Flush the heat exchanger for a minimum of 15 minutes.

5. Apply 621-862 kPa (90-125 psi) pressurized air to the component for a minimum of 30 minutes. The 30-minute purge time is required to force and evaporate all residual solvent from the A/C system component. Failure to successfully remove all residual solvent within the component can result in system damage when reconnected and operated. Dispose of the used flush solvent and filter in accordance with local, state and federal regulations.

6. **NOTE:** A/C system filtering as described in this section is optional if system flushing is carried out. However, the filter kit use is recommended after flushing if the A/C system contamination is extensive.

   Install a new A/C evaporator core orifice (if equipped) and/or TXV (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure.

7. Install new refrigerant hoses with mufflers if clogged with foreign material.

8. Install a new suction accumulator (if equipped) or receiver/drier (if equipped) in any vehicle being serviced for an internal A/C compressor or desiccant failure.

9. Reconnect the heat exchanger being serviced.

10. If a new A/C compressor is not to be installed, lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

11. If a new A/C compressor is not to be installed, evacuate, leak test and charge the A/C system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

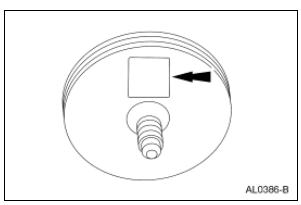
⚠ WARNING: Use extreme care and observe all safety and service precautions related to the use of refrigerants.

⚠ WARNING: Due to refrigerant hazards, always wear safety goggles and non-penetrable gloves when working on A/C systems.

⚠ CAUTION: An A/C refrigerant analyzer must be used before the recovery of any vehicle's A/C refrigerant. Failure to do so puts the shop's bulk refrigerant at risk of contamination. If the vehicle's A/C refrigerant is contaminated, refer the customer to the service facility that carried out the last A/C service. If the customer wishes to pay the additional cost, use the A/C recovery equipment that is designated for recovering contaminated A/C refrigerant. All contaminated A/C refrigerant must be disposed of as hazardous waste. For all equipment, follow the equipment manufacturer's procedures and instructions.

⚠ CAUTION: On vehicles being serviced for an internal compressor or desiccant failure, a new suction accumulator or receiver/drier, thermal expansion valve or evaporator core orifice and any hoses containing mufflers must be installed prior to filtering the A/C system. Internal plumbing of these devices makes it impossible to correctly remove any foreign material/debris. These components are typically discarded after A/C system contamination. Hoses without mufflers can normally be reused unless they are clogged with foreign material. The filter is intended for use on one vehicle only.

1. Orient the filter inlet toward the A/C condenser core.

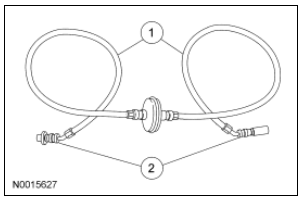


AL0386-B

2. **NOTE:** The pancake filter is not permanently installed and will be removed at the end of this procedure.

   Disconnect the condenser outlet fitting and temporarily install the pancake filter between the 2 halves of the fitting.

   1. Use flexible refrigerant hose of 17,238 kPa (2,500 psi) burst rating.
   2. Make the connections using the A/C Test Fitting Set.



3. Lubricate the refrigerant system with the correct amount of clean PAG oil. For additional information, refer to Refrigerant Oil Adding in this section.

4. Evacuate and charge the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

5. Check all refrigerant system hoses, lines and the position of the newly installed filters to be sure they do not interfere with other engine compartment components. If necessary, use tie-straps to make adjustments.

6. Provide adequate airflow to the front of the vehicle (with a fan, if necessary). Select A/C operation and set the blower motor speed to maximum. Start the engine and let it idle briefly. Make sure the A/C system is operating correctly.

7. Gradually bring the engine up to 1,200 rpm by running it at lower rpms for short periods (first at 800 rpm, then at 1,000 rpm). Set the engine at 1,200 rpm and run it for one hour with the A/C system operating.

8. Stop the engine.

9. Recover the refrigerant. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

10. Remove the fittings, flexible hoses and pancake filter from between the condenser and the condenser to evaporator tube.

11. Discard the pancake filter. It can be used one time only.

12. Reconnect the condenser outlet fitting.

13. Evacuate, charge and leak-test the refrigerant system. For additional information, refer to Air Conditioning (A/C) System Recovery, Evacuation and Charging in this section.

Refrigerant Oil Adding

Printable View (34 KB)

ST2740A	Dye/Lubricant Injector 164-R0775
ST2737-A	Add-On Module Kit 219-00069

Material

Item	Specification
PAG Refrigerant Compressor Oil (R-134a Systems) YN-12-D	WSH-M1C231-B

Refrigerant Oil Adding

⚠ CAUTION: During normal A/C operation, oil is circulated through the system with the refrigerant, and a small amount is retained in each component. If certain components of the system are removed, some of the refrigerant oil will go with the component. To maintain the original total oil charge, it is necessary to compensate for the oil lost by adding oil to the system with the new part.

1. Refer to the chart below for refrigerant oil adding amounts and methods of installation.

Component	PAG Oil Amount	Method of Adding
A/C Compressor	See heading below	Add directly to A/C compressor before installation
Suction Accumulator or Receiver/Drier	See heading below	Add directly to suction accumulator inlet port or inject to low-side service port during system charging
Evaporator Core	45 ml (1.5 oz.) added to the amount collected during refrigerant recovery	Add directly to evaporator core inlet tube or inject to low-side service port during system charging
Condenser Core	60 ml (2 oz.) added to the amount collected during refrigerant recovery	Add directly to condenser core inlet or inject to low-side service port during system charging
Evaporator Core Orifice or Thermostatic Expansion Valve	The amount collected during refrigerant recovery	Inject to low-side service port during system charging
A/C Pressure Relief Valve	60 ml (2 oz.) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging
Refrigerant Hose/Line	60 ml (2 oz.) added to the amount collected during	Inject to low-side service port during system charging

	refrigerant recovery [a]	
O-ring Leak Repair	60 ml (2 oz.) added to the amount collected during refrigerant recovery [b]	Inject to low-side service port during system charging
Service Port Leak Repair	60 ml (2 oz.) added to the amount collected during refrigerant recovery	Inject to low-side service port during system charging

[a] If an excessive amount of refrigerant oil is lost due to a hose rupture/separation or other damage, the total system refrigerant oil capacity must be added.
